J. B. LYON COMPANY, ALBANY, NEW YORK

# PARTIAL LIST OF CONTRIBUTORS TO VOLUME XIII

**ABRAHAM, ISRAEL, M.A.**

Reader in Talmudic and Rabbinic Literature,  
University of Cambridge

**GREAT BRITAIN — ENGLISH JUDA-  
ISM**

**ALEXIS, JOSEPH, A.B., A.M.**

Assistant Professor of Germanic Languages and  
Literatures, University of Nebraska

**GOSTA BERLING, THE STORY OF**

**ACWORTH, W. M., M.A.**

Formerly Lecturer on Railway Economics in the  
London School of Economics and Political  
Science; Member of various Royal Commissions  
and Committees on Railway Matters; Author of  
"The Railways of England," etc.

**GREAT BRITAIN — ENGLISH RAIL-  
WAYS**

**ANWYL, EDWARD, M.A.**

Late Professor of Welsh and Comparative Philology  
and Dean of the Faculty of Arts at the University  
College of Wales, Aberystwyth

**GREAT BRITAIN — WALES**

**ARNOLD-FORSTER, H. O.**

Formerly Secretary to the Admiralty and Secretary  
of State for War; Author of "The Citizen  
Reader," "A History of England," "In a  
Conning Tower," "Our Home Army," etc.

**GREAT BRITAIN — THE BRITISH  
ARMY**

**AYRES, SAMUEL G., D.B.**

Garrett Biblical Institute

**GOSPELS, APOCRYPHAL**

**BAILEY, WILLIAM L., M.A.**

Associate Professor of Political Science, Grinnell  
College

**GOOD ROADS MOVEMENT**

**BALFOUR, GRAHAM, M.A.**

Director of Education to the Staffordshire County  
Council; author of "Educational Systems,"  
"The Life of R. L. Stevenson"

**GREAT BRITAIN — BRITISH EDUCA-  
TION**

**BERRY, GEORGE RICKER, Ph.D., D.D.**

Professor of Old Testament Interpretation and  
Semitic Languages, Colgate University

**HABAKKUK, BOOK OF  
HAGGAI, BOOK OF**

**BOTHNE, GISLE, A.B.**

Head of Department Scandinavian Languages and  
Literatures, University of Minnesota

**HAKON, JARL**

**BREWSTER, WILLIAM T., A.M.**

Professor of English, Columbia University

**GREAT EXPECTATIONS  
GULLIVER'S TRAVELS**

**BROWN, CARROLL N., Ph.D.**

Assistant Professor of Greek, The College of the City  
of New York

**GREEK LANGUAGE**

**BROWN, REV. JOHN, B.A., D.D.**

Formerly Chairman of the Congregational Union of  
England and Wales; Lyman Beecher Lecturer at  
Yale University; author of "History of the  
English Bible," etc.

**GREAT BRITAIN — BRITISH NON-  
CONFORMITY**

**BROWN, PETER HUME, M.A., LL.D.**

Professor of Ancient (Scottish) History and Palaeog-  
raphy in the University of Edinburgh; author of  
"History of Scotland," "The Legislative Union  
of England and Scotland," etc.

**GREAT BRITAIN — SCOTTISH  
HISTORY**

**BYERLY, WILLIAM E., Ph.D.**

Professor of Mathematics, Harvard University

**HARMONIC ANALYSIS**

**CAIRNS, WILLIAM B., Ph.D.**

Assistant Professor of American Literature, Uni-  
versity of Wisconsin

**GOLD-BUG, THE**

**CALLAHAN, JAMES MORTON, Ph.D.**

Professor of History and Political Science, West  
Virginia University

**GREAT BRITAIN — DIPLOMATIC RE-  
LATIONS OF THE UNITED STATES  
WITH**

**HAITI, DIPLOMATIC RELATIONS OF  
THE UNITED STATES WITH**

**CANNAN, EDWIN, M.A., LL.D.**

Professor of Political Economy in the University of  
London

**GREAT BRITAIN — NATIONAL  
FINANCE**

**CAPPER, DAVID SING, M.A., M.I.C.E.,  
M.I.M.E., M.I.E.E.**

Professor of Engineering, King's College, London;  
appointed Teacher in Civil and Mechanical  
Engineering, University of London

**GREAT BRITAIN — ENGINEERING IN  
GREAT BRITAIN**

**CHANDLER, FRANK W., Ph.D.**

Professor of English and Comparative Literature,  
University of Cincinnati

**GUZMAN DE ALFARACHE**

**CIGRAND, BERNARD J.**

Lieutenant United States Navy; author of "Great  
Seal of United States of America" and "History  
of United States Flag"

**GREAT SEAL OF THE CONFEDERACY  
GREAT SEAL OF THE UNITED STATES**

**COLE, FRANK NELSON, Ph.D.**

Professor of Mathematics, Columbia University

**GROUPS, THEORY OF**

**COOPER, LANE, Ph.D.**

Professor of English Language and Literature,  
Cornell University

**GREEK CULTURE**

## Contributors to Volume XIII—Continued

**CORNYN, JOHN HUBERT, B.A., LL.B.**

Editorial Staff of The Americana

GONZALO DE BERCEO  
GOOD COUSINS  
GYPSY LANGUAGE  
GYPSY RELIGION AND FOLKLORE  
HAIDA

**COURCE, CLEMENT W.**

Technical Art Expert

GOLDSMITHING  
GREEK AND ETRUSCAN POTTERY

**DARTON, NELSON H.**

Geologist, United States Geological Survey

GRAND CANYON OF COLORADO  
RIVER  
GREAT PLAINS

**DEIMEL, RICHARD F., B.S., M.A.**

Assistant Professor of Mechanics, Stevens Institute  
of Technology

GRAPHICAL STATICS

**DERRY, JOSEPH T.**

Author of "The Story of the Confederate States"

GORDON, JOHN BROWN

**DOBSON, AUSTIN, LL.D.**

Author of "Life of Goldsmith," etc.

GOLDSMITH, OLIVER

**DOLE, NATHAN HASKELL, A.B.**

Editor of Tolstoi's "Collected Works"

GONCHAROF, IVAN ALEKSANDRO-  
VITCH  
GRIGOROVITCH, DIMTRI VASILYE-  
VITCH

**DOLSON, GRACE NEAL, Ph.D.**

Professor of Philosophy, Wells College

HARTMANN, KARL ROBERT  
EDOUARD VON

**EGGERT, CARL E., B.Ph., Ph.D.**

Assistant Professor of German, University of  
Michigan

HANNELE

**ERSKINE, JOHN, A.M.**

Professor of English, Columbia University

GREENE, ROBERT

**ESTES, DAVID FOSTER, D.D.**

Professor of New Testament Interpretation, Colgate  
University

GOSPELS, THE

**FERNALD, JAMES C., A.B., L.H.D.**

Editor "The Students' Standard Dictionary"

GRAMMAR  
GRAMMAR, ENGLISH

**FINCK, HENRY T., A.B.**

Musical Critic, "New York Evening Post"

GRIEG, EDVARD

**FINLAY, T. A., S.J., M.A., F.R.U.I.**

Professor of Political Economy, University College,  
Dublin; President, University Hall, Dublin;  
Commissioner of Intermediate Education for  
Ireland; Vice-President of the Irish Agricultural  
Organization Society

GREAT BRITAIN—IRISH HISTORY

**FORD, J. D. M., Ph.D.**

Smith Professor of French and Spanish Languages,  
Harvard University

GUZMAN EL BUENO

**GARVIN, J. L.**

Editor of "The Observer" (London); author of  
"Tariff or Budget," etc.

GREAT BRITAIN—THE BRITISH  
TARIFF MOVEMENT

**GEHRING, ALBERT, A.B., A.M.**

Author of "The Basis of Musical Pleasure," etc.

HARMONY

**GRIFFIS, WILLIAM ELLIOT, D.D., L.H.D.**

Author of "Townsend Harris, First American Envoy  
in Japan"

HARRIS, TOWNSEND

**HALL, A. D., M.A.**

Director of the Rothamsted Agricultural Station

GREAT BRITAIN—AGRICULTURE  
SINCE THE 18TH CENTURY

**HAMLIN, A. D. F., A.M., L.H.D.**

Professor of Architecture, Columbia University

GOTHIC ARCHITECTURE  
GREEK ARCHITECTURE

**HARRY, JOSEPH E., Ph.D.**

Author of "The Greek Tragic Poets," etc.

GREEK DRAMA  
GREEK FESTIVALS  
GREEK LAW  
GREEK RELIGION  
GREEK SOCIAL LIFE  
GREEK THEATRE

# THE ENCYCLOPEDIA AMERICANA

G

**G** **ÖTHER**, g'ë'te, Johann Wolfgang (vow), German poet, novelist, playwright, scientist and critic of life: b. Frankfort-on-the-Main, 28 Aug. 1749. From his father, a well-to-do lawyer who practised but little, he inherited methodical ways and a serious attitude toward life. His poetic gift came from his mother, a woman famous for her sprightly letters which have often been edited and translated. The boy Wolfgang grew up in an atmosphere of refinement, his mind duly wrought upon by books, pictures, music and his father's reminiscences of Italy. He never went to school but was taught at home, partly by his father. He early showed a talent for languages; read the usual Latin authors, picked up a good knowledge of French by attending a French theatre that had been started in Frankfort during the occupation of the city by French troops, and learned enough English so that he dared attempt verses in it. As a boy he was very fond of the Bible. His favorite amusement was the puppet-play. He began to make verses before he was 10 years old, soon acquired technical facility and presently came to regard himself as a predestined "thunderer." At the age of 16 he entered the University of Leipzig to study law, such being his father's wish. The lectures bored him and he failed to find a single appetizing study. The result was a mood of disgust with book-learning; it seemed to him a matter of pretentious verbiage, a floating bog of ignorance, guesswork and prejudice, with no rock-bottom anywhere. Such was the mood from which his masterpiece 'Faust' germinated. His poetic efforts met with discouragement, so that he despaired of himself and burned what he had written. Then came a delicious love-affair with his landlady's daughter, whom he tormented with morbid jealousy. This experience revived his poetic ardor and he made a little play out of it—a one-act pastoral in alexandrine verse, wherein an all-too-jealous lover is duly punished for his perversity. This first play is only a trifle, but it is based on real experience. Henceforth "confession" was to be its author's line; no more "thundering" in ambitious projects like the 'Belshazzar' that he had been working at but the faithful rendering of the things, however humble, that actually concerned him. Out of this same love-affair—the girl's name was Anna Katherine Schönkopf—grew the collection called 'Annette,' con-

sisting of short poems and prose tales which were discovered and published in 1885. They are in the conventional pastoral vein and contain no forewarning of a notable lyric gift. Goethe remained at Leipzig nearly three years. While the university gave him nothing that he could assimilate he found satisfaction in Oeser's art-school, where he took lessons in drawing and etching and learned to admire the "noble simplicity" of Greek art. At this time he was often moody and morose and lived imprudently in a morbid resolve to punish his body for the sins of his mind. In the summer of 1768 he was prostrated by a grave internal hæmorrhage which was at first thought to portend consumption. This sent him home without his degree and doomed him for a year and a half to the life of an invalid recluse. At first his life seemed to be in danger. As he slowly grew better he spent his time reading, meditating and debating the way of salvation with a certain Fräulein von Klettenberg, a saintly pietist who was an intimate of the household. Under her influence religion came home to him as a highly personal matter. His was a normal case of conversion save that there was no conviction of sin, no agonizing over the safety of his soul. He remained cheerful but attended the prayer-meetings of the local pietistic circle, took part in their communion service and for a while used the language of the very devout. Later he drifted away from these associations, but his nature had received an indelible impression. In time men called him and he called himself a heathen, but he had been deeply touched by the mystic appeal of religion and remained to the end of his days deeply sensitive to all genuine manifestations of religious feeling. As his convalescence proceeded he took up the study of the occult, reading Paracelsus, Van Helmont, Welling and other writers on magic, alchemy, cabalism and all that sort of thing. He even set up an alchemist's laboratory and performed some experiments in search of the philosopher's stone. All this, too, was soon left behind, but not without lasting effects. He had got hold of the idea of natural magic (*magia naturalis*), something very different from the vulgar black art and described as the queen of the sciences and the perfect flowering of religion. It was not the art of calling up spirits to do the devil's work, but of getting into communion with planetary beings of a higher order and thus obtaining direct spiritual

illumination and divine power, like that of a god. This is the kind of magic that he was to utilize in 'Faust.' Before leaving home to continue his university career he published a small collection of songs which he likened to wild flowers. To-day they hardly make that impression, being a young critic's comment rather than a poet's cry. To this period also belongs, probably, a second play in alexandrines, the 'Fellow-Culprits.' It is a three-act comedy in which all the characters are morally tainted and finally unmask one another as poor miserable sinners. The piece is not very edifying, but in after years its author had a certain fondness for it as an acting play. In April 1770, Goethe went to Strassburg, then a French city. His plan was to take his degree in law and then to visit Paris for the perfection of his French. But it was not so fated. Circumstances brought it about that in the French atmosphere of Alsace his mind turned against things French, especially the French drama, and he began to feel pride in his German blood and to seek in the history and traditions of his own country the inspiration for the imaginative projects that were already haunting him. Among these were 'Faust' and 'Götz von Berlichingen.' After he had been in Strassburg half a year, studying more medicine than law, he made the acquaintance of Herder, who was destined to influence him considerably. Herder was about six years older than Goethe and in the first flush of a budding literary reputation. His temper was that of a radical reformer sharply at variance with the spirit of his age. His mind was teeming with the germinant ideas of a new era in literature, criticism, education and religion. He was an ardent admirer of the folksong and held that genuineness of feeling is the only criterion of good literature. He hated artificiality and imitation and loathed the Frenchified verse of the day. He held that the truly great poets such as Homer, Shakespeare and Ossian—he supposed Macpherson's Ossian to be a genuine old Celtic bard—were admirable mainly because they had expressed the life of their several epochs in its fullness and characteristic flavor. The grand criterion of merit was not correctness or good taste, not artistry of any particular kind, but sincerity and fullness of life. The more smell of the soil the better. In many a talk while he was detained in Strassburg by a tedious surgical operation Herder poured these ideas into the listening ear of Goethe, whose mind was all ready to receive them. The consequence was a new orientation. The young law-student conceived a boundless admiration for Homer, Shakespeare and Ossian, became a zealous collector of Alsatian folksongs and made a careful study of the Gothic minster at Strassburg. He felt himself strangely drawn to the then despised Gothic style which he erroneously believed to represent a national German art. In 1772 he published a short dithyrambic paper on the cathedral—a paper which counts as one of the first bugle-blasts of the coming romantic reaction in favor of the Middle Ages. In short, Goethe became—for a little while in his youth—the prey of a perfervid Germanism. And then there was his brief summer romance with the country maid, Friederike Brion, who is so charmingly pictured in the tenth book of his autobiography. Under the spell of this passion

he began to indite the songs which usher in a new epoch in the history of German lyric poetry. The characteristic quality of this new lyricism is its power of suggestion. It captivates not so much by what it says as by the overtones of feeling and association that it awakens. It is very simple in form, without any verbal pyrotechnics; true to the elemental feelings of human nature; mild based on the old haunting melodies of the folksong. In the summer of 1771 Goethe returned to Frankfurt with the title of licentiate (not doctor) and took up the practice of Holy Roman law. His thoughts were now busy with the 'Autobiography of Götz von Berlichingen,' whom he idealized as a towering idealist and a "rude self-helper in times of anarchy." He proceeded to turn some of the more stirring scenes of the old book into dialogue, thus presenting a life-history in a succession of dramatic pictures. Götz was in reality an outlaw, a typical robber-knight of the 16th century, who set himself up against the only forces which were just then making for public order. But Goethe invested him with the halo of a martyr to liberty. In writing he had no thought of the stage or of any rules of play-making. His main artistic purpose was to exhibit the form and pressure of an interesting past epoch. In thus following his instinct in defiance of all conventions he believed that he was Shakespeareizing. With some revision the play was published anonymously in 1773 and met with great literary success. Its vigorous realistic prose, its variety of incident, its bluff and hearty life-likeness were very refreshing to a convention-ridden age. In 1774 appeared the 'Sufferings of Young Werther,' the most famous of all sentimental novels. The story is told in letters after the manner of Richardson and Rousseau. Werther is a super-sensitive, weak-willed youth, sadly lacking in stamina and self-control, who "suffers" from over-tension of feeling. He is something of an artist, but does not draw because of his overwhelming emotions. A passionate lover of nature, of children, of humble folk and of the simple life, he finds the higher social strata everywhere hard-hearted, selfish and conventional. He falls in love with a betrothed girl whom he can neither win nor renounce. Life becomes meaningless and hopeless. At last he shoots himself. This story grew out of experiences of Goethe at Wetzlar, where he lived for a short time in 1772 for the purpose of studying the practice of the imperial Chamber of Justice. Based to some extent on actual letters and seeming to be a veritable transcript of life, 'Werther' took Germany by storm and the fame of it soon spread all over Europe. Essentially it is a morbid book and it loosed a flood of mawkish sentimentalism. Its author himself had suffered from the melancholia of adolescence and had even nursed thoughts of suicide. In writing 'Werther' he expelled the poison from his own system but at the same time created a gospel of 'Weltschmerz' and sentimental pessimism for his contemporaries. People wept copiously over the badness of a world that had done to death such a noble, delicate soul as Werther. Withal the splendid literary art of the book, its hectic tension of feeling, and the unprecedented power with which familiar emotional values are exploited, raised it at once to the position of an immortal classic

JOHANN WOLFGANG GOETHE

in its kind. 'Werther' was followed, also in 1774, by 'Clavigo,' a prose tragedy of more regular construction than 'Götz,' based on the memoirs of Beaumarchais. A Spanish youth Clavigo is engaged to a sickly girl but casts her off in the fear that she will be a clog on his ambitious career. Her brother rushes to Madrid to right her wrong and kills Clavigo in a duel by the girl's coffin. In the original memoirs there is no such tragic ending, but in all his early years Goethe's vision of the tragic always included a girl deserted by her lover for prudential reasons. In 1775 came 'Stella,' in which a man deserts his wife out of sheer restlessness, marries another woman and then deserts her too. In the play the two women meet by accident and after painful scenes agree to share the delectable Fernando between them. So far was Goethe willing to go at this time in championing the rights of the afflicted heart against the conventions of society. In a later version he made the play end with the fickle husband's suicide. Several minor works of Goethe's busy adolescence must here be passed by. They are chiefly bagatelles of humorous or satiric import, but one of them is a splendid fragment of a Prometheus-tragedy, in which the Titan artist bravely declares war against the ever-living gods. It was not here, however, but in 'Faust' that the insurgent spirit of young radicalism found its appointed vehicle. A considerable part of 'Faust' was "stormed out" in 1774 and 1775. Out of his own transient disgust with book-learning, his study of the occult and his musings on the old legend Goethe had distilled the conception of a Superman who despairs of study, deserts the intellectual life and leagues himself with a demon for a grand sensual debauch. Following hints of the old story he made his hero a searcher after truth, an eager traveler and a passionate lover of antique beauty. But for a man of the 18th century these were of course not the traits of a bad man on the way to hell. As soon as the imaginary Faust became the mouthpiece of Goethe's own struggles and aspirations it was all up with his traditional badness. At first, however, Goethe did not plan to save his hero any more than to damn him. His scheme was that after many years of varied experience Faust would become reconciled to life by finding some useful work to do—work that would give him the sense of having lived to some purpose and permit him to die in a rapt provision of the benefit others would get from his performance. From this fundamental plan of his youth Goethe never deviated. In the middle portion of his life he decided not only to "save" his hero but to make his ascension among the saints a part of the dramatic action. Faust was now thought of as a man who had gone grievously wrong while wandering in the dark of passion and instinct, but was essentially a "good man" by virtue of his "striving" and would one day be led out into the "clear" by the Lord in Heaven. Thus the old tragedy of sin and damnation was converted into a symbolic drama of struggle toward the light, ending among the saints in glory. The early scenes of 'Faust,' those written before 1776, are mainly occupied with the love-tragedy of Gretchen, which is a terribly drastic comment on the status of the unmarried mother in the Germany of that day. Still another of Goethe's

major works was begun in the days of his youth, namely, the tragedy of 'Egmont,' whom he conceived as a "demonic" character borne on to his doom by a levity of spirit amounting to tragic frivolity. In the midst of work on 'Egmont' he was invited by the young Duke of Weimar, then a youth of 18 who had lately taken the reins of government from his mother's hands, to visit the Weimar court. He arrived toward the end of 1775, expecting to stay but a few weeks, but he remained all the rest of his days. The duke liked him, made a friend of him and presently gave him a seat in the government council with the rank of Councillor of Legation. There were many misgivings over this step, for the new official was not of the nobility, had had no experience of public business and was reputed to be a "genius," that is, a person of unsteady and unconventional ways. But he took his new duties very seriously and for some time quite neglected the literary projects that he had brought with him from Frankfurt. At different times he had to do with the mining interests, military affairs, public improvements and finances of the little duchy, and in 1784 became president of the Council. He had previously received a diploma of nobility. In the new environment he engaged eagerly in the study of mineralogy, geology, botany and zoology, thus preparing the way for a little paper on the metamorphosis of plants and another on the intermaxillary bone in the human skull. These papers and others have given him a modest place in the history of modern evolutionism. Hard work and close scientific study, together with a fresh reading of Spinoza's 'Ethics,' exerted a sobering influence on his character and helped to ban the demons of unrest which had never quite ceased to haunt him since the days of 'Werther.' On the other hand, the new life gradually starved his artistic nature, for he was a born dreamer who liked nothing else so well as solitary communing with the creatures of his own imagination. Thus there came into his life a dissonance which finally became so sharp that he could refer to it as a "terrible disease." From this he sought relief in the autumn of 1786 by a sudden departure for Italy. He remained there nearly two years, undergoing a "spiritual rebirth." Italy restored his buoyancy of mind, his joy in life. Naturally the poetic achievement of that first decade in Weimar was small. Everything waited for the leisure and the mental serenity that came first in Italy. Most significant are a number of short poems embodying a new ethical philosophy of self-control and high aspiration. He also wrote several dramatic trifles for the amateur actors of the court circle. But his major works made little or no progress. He wrote an 'Iphigenie' in rhythmic prose, but was dissatisfied with it. He also began a play on the life of Tasso and worked intermittently on a new novel called 'Wilhelm Meister's Theatrical Mission,' which was at first conceived as a sort of antidote to 'Werther' in that the hero would be saved by finding a vocation. In these works Goethe appears as the apostle of a refined personal culture based on the equilibrium of feeling and reason. While in Italy he transcribed his prose 'Iphigenie' into mellifluous blank verse, making it a tribute to the sanative power of ideal womanhood such as his partial imagina-

tion saw in Charlotte von Stein. After his return he finished 'Tasso' in the same verse, putting into it much of the conflict he had known between the claims of art and of practical affairs. These poetic plays, together with 'Egmont,' which remained unperfected, are the finest products of Goethe's art in its second phase. Not highly dramatic they are rich in delicate commentary on human nature. After his return from Italy he did not again put on the harness of an administrative drudge, but devoted himself mainly to letters and scientific study. That emancipation of the sensual man which had taken place in Italy found expression in the frank eroticism of the 'Roman Elegies,' which were written in the early days of his conscience-marriage with Christiane Vulpius. This relation began in 1788. She kept his house and bore him several children; but while he always regarded her as his wife they were not wedded in church until 1806. The outbreak of the French Revolution awakened in him hardly any other emotions than those of cynical disgust. The noisy democracy of France seemed to him to consist only of dupers and duped and he wrote two or three weak plays to exploit the humbug of the revolutionary excitement. In 1792 he accompanied the Duke of Weimar on the Austro-Prussian invasion of France, heard the cannonade at Valmy and saw the seamy side of war when the invaders were tumbled back across the Rhine by the republican armies. And then began, in 1794, under the inspiration of Schiller's friendship, a new era of notable creation. In 1796 he published 'Wilhelm Meister's Apprenticeship,' a cultural novel that had quite outgrown the original scheme. Instead of finding a satisfactory "mission" in play-acting and the management of a theatre Wilhelm is made to conclude that the dramatic art is not his true vocation. Another must be found by search and experimentation. Thus the original "theatrical mission" was changed into an "apprenticeship" in the school of life. In due time an occasion was found for sending the hero to Italy. So the tale was brought to an end unfinished, the way having been prepared for a continuation under the name of 'Wilhelm Meister's Wanderings,' which was not completed until 1829. Taking both parts together 'Wilhelm Meister' is replete with the wisdom of one of the wisest of men, but as prose fiction it is too leisurely and discursive for the modern novel-reader.

A general favorite, on the other hand, is 'Hermann and Dorothea,' written in 1797 in heroic hexameters. It is a picture of German still life drawn against the background of the Revolution. Dorothea is a poor refugee who has been compelled to flee eastward across the Rhine with her fellow-villagers. Amid the general distress she is wooed and won by Hermann, the son of a well-to-do innkeeper. The story is charmingly told, the stately Homeric verse applied to such a lowly theme having somewhat the effect of a subtle humor. Incidentally the scheme afforded a place for Goethe's ripper views of the Revolution, though he was too close to the great upheaval to see its larger import. Just at the end of the century he planned a trilogy called the 'Natural Daughter,' which was to picture phases of the Revolution, but only one of the three parts was ever written, and this is a literary closer-drama quite

lacking in dramatic power and verisimilitude. The most important work of this period was the completion of the first part of 'Faust.' Back in 1790 he had published some of the scenes on hand under the title 'Faust, a Fragment.' As it ended with the betrayed Gretchen's agony in the cathedral no one could have divined the plan of the poem as a whole. Resuming work on his masterpiece in June 1797, Goethe first wrote a prologue in which the reader was duly apprised that the new Faust would end in heaven, not in hell. Then, finding the material as it lay in his mind too vast for a simple play, he decided to make two parts of it and to postpone for a second part all that portion of the plot which was to follow Gretchen's death. The publication of the first part in 1808 made it clear that here was the high-water mark in German letters; something altogether incommensurable with aught that had gone before. From this time forth Goethe deserved the name applied to him by Lord Byron—"monarch of European letters." The death of Schiller in 1805 was a great bereavement. For 11 years he and Goethe had been close friends, to some extent collaborators. They worked together on the 'Xenia,' a collection of stinging and stinging epigrams, and also in editing Schiller's magazine *Die Horen*. Withal, as director of the Weimar Theatre—a position he held from 1791 to 1817—Goethe leaned hard on the superior dramatic insight of Schiller when it was a question of telling work for the stage. The correspondence between the two men is of many-sided interest and counts justly among the classics of letter-writing. In the stormy years that followed Schiller's death, while Europe was battling with Napoleon, Goethe kept to his literary work and scientific studies, paying little attention to world-politics. Nationalistic patriotism was never his affair. What he most cared for was the perfection of the individual, and he had seen German culture flourish greatly under a weak and incoherent empire. He had no reason to suppose that it would flourish better through the aggrandizement of Prussia or Austria. He disliked the Prussians, was suspicious of Russia and as a lover of clearness had much sympathy with the French genius. At Erfurt in 1808 Napoleon treated him very handsomely and he was duly grateful. The only path of safety for himself and his beloved Weimar was to acquiesce in Napoleon's régime. He was not a good hater and he acquiesced. The important works of this Napoleonic period are a third novel, the 'Elective Affinities,' a bulky treatise on the 'Theory of Color,' and the beginning of an autobiography entitled 'From my Life; Poetry and Truth.' The novel is a tragic tale of disaster due to the invasion of the marriage relation by lawless passion. It has no specific tendency other than to show the danger of treating moral relations as if they were subject to necessary laws like those of chemical affinity. The heart of the matter is the story of a sensitive girl's suicide from a morbidly acute sense of remorse. In his 'Theory of Color' Goethe embodied laborious researches that had extended over nearly 20 years and cost him much vexation of spirit because he could not make the world believe that Sir Isaac Newton had been a teacher of false doctrine. In 'Poetry and Truth' we have an elderly man's romanticizing account of his youth. The book

ends with the year 1775 and has much to say of his love-affairs. The "poetry" of the title does not mean that there is an admixture of deliberate fiction. Goethe held that a fact is important not because it is true but because it is significant. To select and record the significant, whether in one's own life, or another man's, or in that of an imaginary hero, is to perform an act of the creative imagination, in other words, to poetize. On the whole 'Poetry and Truth' is as accurate as autobiographies are wont to be, and the earlier books at least show Goethe's matured prose style at its very best. To the final phase of his career, his old age, belong, aside from critical and scientific miscellanies, his 'Divan' and the completion of 'Wilhelm Meister' and 'Faust.' In the 'Divan' (1819) the septuagenarian poet turned to account his recent studies in Persian poetry. He borrows the imagery and apparatus of Hafiz and uses it to set forth thoughts of his own. 'Wilhelm Meister' was completed very inartistically, extraneous matter having been included in order to fill space. The 'Wanderings' are most significant for the evidence the book affords of the aging Goethe's interest in the socialistic theories and speculations that were just then beginning to make a noise in the world. From 1824 to 1831 Goethe's principal, but by no means exclusive, occupation was the finishing of the great dramatic poem which he had begun in the nebulous days of his youth. With engaging humor, with no perceptible waning of poetic power, except perhaps in the latter part of the fourth act, and with an astonishing freshness of imaginative vision, he carried his singular hero through a wonderful series of symbolic experiences and finally took leave of him as a divine entelechy mounting heavenward in the train of the Mater Gloriosa, mystically drawn on by the Eternal-womanly. The long task was finished in the summer of 1831 and the aged poet now regarded his life-work as essentially done. He died on 18 March 1832. There is no authentic record of his last words. During the 19th century Goethe's prestige increased enormously, and not merely in his own country, until it became common to link his name with those of Homer, Dante and Shakespeare. Matthew Arnold called him the "clearest, largest and most helpful thinker of modern times"; while Emerson declared that the "old Eternal Genius that built the world had confided itself more to this man than to any other." Such estimates, and many more of like import might be quoted, imply a larger reverence for personal culture and the contemplative life than accords with the temper of the present age. But, however the opinion of coming generations may shape itself with respect to the "helpfulness" of Goethe's thinking, he will always stand out in the retrospect as the great organ-voice of a unique and memorable epoch. See TRUTH AND POETRY; ELECTIVE AFFINITIES; SORROWS OF WERTHER; WILHELM MEISTER; EGMONT; HERMANN AND DOROTHEA; FAUST; IPHIGENIA.

**Bibliography.**—The literature pertaining to Goethe is enormous. Consult Goedeke's 'Grundriss,' 3d ed., Vols. IV and V, where 1,424 closely printed octavo pages of it are listed. A large part of this literature consists, however, of what has been called Goethe-philology, i.e., books, brochures and articles written by

specialists for specialists and dealing with relatively small questions of biography, criticism, personal relations, influence, provenience of ideas, etc. The chief repositories for this kind of research are the 'Goethe-Jahrbuch,' beginning in 1880, and the 'Schriften der Weimar Goethe-Gesellschaft' (28 vols., including numerous portfolios of drawings, facsimiles, etc.). Good periodical reviews of recent Goethe literature are found in the *Jahresberichte für neuere deutsche Literaturgeschichte*, beginning in 1892, and in the journals *Euphorion* and *Das literarische Echo*. Editions, complete and partial, are very numerous since the expiration of the Cotta copyright. The most ambitious is the Weimar edition, 128 vols., comprising 50 vols. of letters and 13 of diaries, together with copious critical apparatus. More convenient is the excellent 'Jubiläumsausgabe' (Stuttgart 1907-10). Meritorious are also the 'Propyläen-ausgabe' (Munich 1909-14); the Hempel edition, Berlin 1868-79 (new Goldne Klassiker ed., 1910-14); the Heinemann edition (Leipzig 1900), and that contained in Kürschner's 'Deutsche Nationalliteratur.'

The conversations have been best edited by W. Biedermann, 'Goethes Gespräche' (10 vols., Leipzig 1889-96); for the conversations with Eckermann see also Houben's edition (Leipzig 1911). As before stated, the letters are now available all together in Weimar edition of the works; but special mention may be made of the 'Goethe-Schiller Correspondence,' ed. by Graef and Leitzmann (Leipzig 1912); and of the letters to Frau von Stein, ed. by W. Fieditz (Frankfurt 1883-86), and by Fraenkel (Jena 1908). The outstanding biographies are those of Bielschowsky, A. (Munich 1896-1904; trans. by Cooper, New York 1905-08); Brandes, G. (Copenhagen 1915); Carus, P. (Chicago 1915); Chamberlain, H. S. (Munich 1912); Düntzer, H. (Leipzig 1880; trans. by T. W. Lyster, London 1883); Geiger, L. (Berlin 1910); Grimm, H. (Berlin 1875; trans. by S. H. Adams, Boston 1880); Heinemann, K. (Leipzig 1895); Lewes, G. H. (London 1856); McCabe J. (London 1912); Meyer, R. M. (Berlin 1895); Thomas, C. (consisting partly of studies and appreciations; New York 1917); Witkowski, G. (Leipzig 1899). Miscellaneous works of importance are Appell, J. W. 'Werther und seine Zeit' (Oldenburg 1855); Bode, W., 'Goethes Aesthetik' (Berlin 1901); Boucke, E. A., 'Goethe's Weltanschauung' (Stuttgart 1907); Gloel, H., 'Goethes Wetzlarer Zeit' (Berlin 1911); Graef, H. G., 'Goethe über seine Dichtungen' (9 vols., Frankfurt 1901-14); Maass, E., 'Goethe und die Antike' (Stuttgart 1912); Magnus, R., 'Goethe als Naturforscher' (Leipzig 1906); Mentzel, A., 'Der Frankfurter Goethe' (Frankfurt 1900); Morris, M., 'Der junge Goethe' (6 vols., Leipzig 1909-12); Schmidt, E., 'Charakteristiken' (Berlin 1896); Scherer, W., 'Aufsätze über Goethe' (Berlin 1886); Vogel, J. and Traumann, E., 'Goethes Studentenjahre' (Leipzig 1910); Wasilewski, W. von, 'Goethe und die Descendenztheorie' (Frankfurt 1903); Weissenfels, R., 'Der junge Goethe' (Tübingen 1899).

CALVIN THOMAS,  
Professor of Germanic Languages and Literatures, Columbia University.

**GOETHITE**, *gé'tit*, a hydrous sesquioxide of iron, contains when pure 62.9 per cent of iron. It differs from hematite in having a yellow streak and from limonite in containing more water and crystallizing in the orthorhombic system. It is known in England and in Saxony as well as in the States of Missouri, Colorado and California. The lower grade yellow or reddish iron ores of the Lake Superior region, particularly on the Mesabie range in Minnesota, contain considerable goethite, and the mineral is thus an iron ore of some importance, though it is not distinguished commercially from limonite. See *Iron*.

**GOETSCHUIS**, *gét'shi-ús*, *Percy*, American musical scholar: b. Paterson, N. J., 30 Aug. 1853. He was graduated from the Stuttgart Conservatory, became an instructor there (1876), and was appointed to a royal professorship (1885) by the king of Württemberg. In 1890 he received appointment to the professorship of harmony, musical history and advanced pianoforte in the musical department of Syracuse University, and in 1892-96 was professor of composition in the New England Conservatory at Boston. He became organist of the First Parish Church (Unitarian) of Brookline, Mass., in 1897. In 1905 he was made head of the theory department at the Institute of Musical Art, New York. In addition to his compositions, including anthems, sacred songs and instrumental works, he wrote 'The Material Used in Musical Composition' (1882); 'The Theory and Practice of Tone Relations' (1892); 'The Homophonic Forms of Musical Composition' (1898); 'Applied Counterpoint' (1902); 'Lesson in Music-Form' (1904); 'Exercises in Elementary Counterpoint' (1909); 'Essentials of Music History' (1913); 'The Larger Forms of Musical Composition' (1915).

**GOETZ**, *gét's*, (*Leopold*) *Karl*, German theologian and author: b. Karlsruhe 1868. He received his education at the universities of Bonn and Berne. Joining the body of Old Catholics he became, in 1892, pastor of one of their congregations at Passau, where he remained for eight years. From 1900 to 1902 he taught in the Old Catholic Seminary of Bonn, and in the latter year became professor at the university there. He published several works on church history, seeking more especially to state the grounds of separation between the Old Catholics and the Papacy. These works are 'Busslehre Cyprians' (1895); 'Geschichtliche Stellung und Aufgabe des deutschen Altkatholizismus' (1896); 'Geschichte der Slavennapostel Konstantinus und Methodius' (1897); 'Lazaristen und Jesuiten' (1898); 'Leo XIII' (1899); 'F. H. Reusch' (1901); 'Das Kiever Höhlenkloster als Kulturzentrum der vormongolischen Russlands' (1904); 'Kirchenrechtliche und Kulturgegeschichtliche Denkmäler Altrusslands' (1905); 'Staat und Kirche in Altrussland' (1908).

**GOETZ**, *Theodor von*, German painter: b. Lieschen, Siberia, 1826; d. 1892. He began as a genre painter, but in 1848 entered the army and during the Schleswig-Holstein campaigns filled his portfolio with sketches of march and battle. He thenceforward devoted himself to painting military scenes, and became renowned as a battle painter. He took part in the Franco-Prussian War of 1870-71, and

painted many striking incidents of the campaign. Noteworthy is his 'Episode in the Battle of Sedan' (1875), one among many remarkable canvases which render him the Horace of Germany.

**GOETZE**, *Frederick Arthur*, American engineer: b. Jersey City, N. J., 17 April 1870. He was educated at Hoboken Academy 1877-82, Stevens Preparatory School 1882-85, Cooper Union, New York city 1885-87 and the Columbia School of Mines 1893-95. He was successively assistant superintendent and superintendent of buildings and grounds, at Columbia University from 1895 to 1907. From 1907 to 1916 he was dean of the schools of mines, engineering and chemistry there and since 1913 has served as comptroller and since 1916 as treasurer at the same institution.

**GOFF**, *John W.*, American justice: b. Wexford, Ireland. He came to the United States when a child, was educated at Cooper Union, studied law under Hon. S. G. Courtney and was admitted to the bar in 1870. He was assistant district attorney of New York in 1888-91; was counsel for the law association in the investigation and prosecution of election frauds in New York, and for the Lexow senatorial committee of investigation of the administration of police affairs in New York. He was last recorder of the city of New York, 1894-1906; and in 1907 became justice of the Supreme Court of New York, in the First District, for the term 1907-20. He presided over the trials of the gunmen and of Charles Becker in the famous Herman Rosenthal murder case.

**GOFF**, *Nathan*, American legislator: b. Clarksburg, W. Va., 9 Feb. 1843. He was educated at Georgetown College and the University of the City of New York, and was admitted to the bar in 1866. He served in the Civil War in the Union army, rising from the rank of lieutenant to major. He was elected to the West Virginia House of Representatives in 1867; was United States district attorney in the district of West Virginia in 1868-81 and 1881-82. He served as Secretary of the Navy in the Cabinet of President Hayes in 1881, and was a member of the United States House of Representatives in 1883-89. He was United States Circuit Justice of the Fourth Circuit in 1892-1911; justice of the United States Circuit Court of Appeals in 1912-13; and in 1913 he was elected to the full term in the United States Senate.

**GOFFE**, *gôf*, *William*, English regicide: b. Sussex, about, 1605; d. Hadley, Mass., about, 1679. He became apprenticed to a salter in London; in 1645 became a captain in the New Model, and served with distinction in the civil wars. He was one of the judges who signed Charles' death warrant, became a major-general, sat in the House of Commons, and in Cromwell's 'other house,' and was a staunch Cromwellian. Being excepted from the act of indemnity, in 1660, with his father-in-law, Gen. Edward Whalley, he fled to America; and they lay in hiding round about New Haven from 1661 to 1664, when they went to Hadley, Mass.: There they lived for many years in seclusion; and it is there that, according to the well-known tradition, when the townsmen were called from the meeting-house to repel an In-

dian attack, and were standing irresolute, Goff put himself at their head and drove off the foe, and then disappeared as suddenly as he had come. The genuineness of the story, however, is more than doubtful; but literary uses have been made of it by Scott, Fenimore Cooper and Hawthorne. His papers have been printed by the Massachusetts Historical Society. Consult Stiles, 'History of Three of the Judges of King Charles I' (1794), and Judd's 'History of Hadley' (Springfield 1905).

**GOFFSTOWN**, N. H., village in Hillsborough County, eight miles northwest of Manchester and 15 miles southwest of Concord on the Piscataquog River, and on the Boston and Maine Railroad. The village dates to 1748 and was incorporated in 1761. It is the seat of Saint Suselm's College and is known as a summer resort. It has manufactories of sash and blinds, bobbins and spools. Pop. 2,579.

**GOG and MAGOG**, a king and his nation mentioned in Ezekiel, and the book of Revelation ("the prince of Kosh, Meshech and Tubal from the land of Tubal"). Gog, king of the Magog people, represented the northern hordes, who were to invade western Asia (Ezek. xxxviii, 39). Probably Gog was the Gyges of the Greeks, Gyges being a typical name for kings reigning northwest from the Assyrians. The event predicted was the irruption of the northern nations into Syria. Gog and Magog are also the names given to two reputed giants of early British history, whose statues are erected in the Guildhall in London. The legend reported by Caxton with reference to these personages declares that they were the last two survivors of the sons of the 33 infamous daughters of the Emperor Diocletian, who, having murdered all their husbands, were sent to sea in a ship, and arriving in Britain and cohabiting there with demons, had a number of giants for their offspring. These giants, it is said, were conquered and brought prisoners to London, where they were kept chained to the gates of a palace on the site of the Guildhall. When they died their place was taken by effigies of them. Effigies called Gog and Magog certainly existed in London at a very early period, and they were sometimes brought out and placed on a conspicuous place to welcome a sovereign entering the city, as was done to Henry V in 1415; Philip and Mary in 1554; and Queen Elizabeth in 1558. The old effigies were burned in the great fire in 1666. The present figures of Gog and Magog, which are 14 feet high, were erected in 1708.

**GOGEBIC RANGE**. See IRON ORE DISTRICTS.

**GOGGERLY**, Daniel John, English missionary and scholar: b. London, August 1792; d. Colpetty, Ceylon, 6 Sept. 1862. He became a Wesleyan preacher at an early age, and in 1818 went to Ceylon to take charge of the Wesleyan mission press at Colombo. In 1822 he became a missionary and was one of the first to preach to the natives in Singhalese. He devoted himself seriously to the study of the languages of the country and was the first European to give critical study to the language of the Páli, the native tongue of Buddha's country, Magadha. He was stationed at Madura in 1834 and there

studied Páli under the native priests. He compiled a dictionary of Páli, 15,000 words, and induced the Buddhist priests to make copies of all their sacred books, with glossaries and annotations, a collection which at his death became the property of the mission. He was from 1822 one of the translators of the British and Foreign Bible Society, the Singhalese version being in a large measure the result of his labors, and he passed the entire version as editor and corrector. He was appointed superintendent of the mission in 1838. He made important contributions to the *Journal of the Royal Asiatic Society*, translated the 'Játakapata' ('Book of 500 Births of Buddha'), and wrote a polemic work against Buddhism 'Christiani Pragnyapti: the Evidences and Doctrines of the Christian Religion: in Singhalese' (Colombo 1862). He was widely recognized as a master of Páli literature.

**GOGGLER**, or **GOGGLE-EYE**, names given colloquially to several fishes that have prominent eyes, as the rock-bass, the wall-eyed pike and a tropical crevalle. American gunners call a duck, the surf scoter, "goggle-nose," in reference to spectacles-like spots on its bill.

**GOGOL**, gó'gól, Nikolai Vassiljevitch, Russian novelist and dramatist, the father of modern Russian realism: b. in the government of Poltava, 31 March 1809; d. Moscow, 3 March 1852. From an early period he evinced a liking for the drama, endeavored unsuccessfully to establish himself as an actor, and at 19 entered the office of the domain of lands at Saint Petersburg as a copying clerk, becoming thereafter successively professor of history in the Patriotic Institute, a private tutor, and professor of history in the University of Saint Petersburg. In 1829 he published his first work 'Nights on a Farm near Díkánka,' and its remarkably vivid character drawing aroused widespread interest in its author. 'Mingorod' a collection of tales mainly illustrative of life and customs in Little Russia, followed in 1834. In 1836 he produced his great comedy, 'The Revizor' (inspector-general), the mordant satire of which drew a cry of distress from the dishonest and incapable provincial bureaucrats at which it was aimed, and its representation would certainly have been banned but for the Emperor Nicholas I, who appeared rather to enjoy the situation thus created. But the author was somewhat disconcerted by the feeling aroused by his comedy, and his health suffered in consequence. Between 1836 and 1848 he resided principally in Rome. In 1842 he produced his most famous work 'Dead Souls,' a novel without a plot, in which he again satirized public abuses and the barbarism of provincial manners. Laughter with tears in the background and a note of irony are the dominant notes of this remarkable novel, in which he introduced succession of types of all classes in Russia. His health was now failing; he became a victim of melancholy and hypochondria; his second volume of 'Dead Souls' was written, but in his alienation he consigned it to the flames. Fragments of a draft that have been recovered show how great was the eclipse that had clouded his intellect; for the characters are dull respectabilities. His last work 'Correspondence with Friends' (1847) furnished fur-

ther proof of his ruined intellect: ascetic, mystical and reactionary, it is a moving and depressing recantation of his more virile work. He made a pilgrimage to Jerusalem in 1848. By temperament, imagination and intellect a true son of the steppes, Gogol's earlier works are assured of a permanent place in the literature of Russia. His principal tales have been translated by Hapgood (New York 1886); and 'The Revizor' by Mandell (New York 1910). See DEAD SOULS.

**GOING, Charles Buxton**, American engineer, author and editor: b. Westchester, N. Y., 5 April 1863. He was graduated at Columbia in 1882, and in 1896 became connected with the *Engineering Magazine*, of which he was managing editor in 1898-12 and editor in 1912-15. He has been editor of the Works Management Library since 1915. He has lectured on industrial engineering at Harvard, Columbia and New York universities and at the University of Chicago. He is a member of the American Society of Mechanical Engineers and corresponding member of the Canadian Mining Institute. Author of 'Summer-Fallow' with Marie Overton Corbin (1892); 'Urchins of the Sea' (1900); 'Star-Glow and Song' (1909); 'Methods of the Santa Fé' (1909); 'Principles of Industrial Engineering' (1911), etc.

**GOITO**, Italy, village of Lombardy in the province of Mantua, 11 miles northwest of Mantua, on the right bank of the river Mincio, and on the road to Brescia. It is located near a bridge, which has given it military importance, and it has been fortified as a bridge-head at different times. It has seen many battles, among them the victories of the Piedmontese forces over the Austrians 8 August and 30 May 1848. Pop., village, 737; commune, 6,702.

**GOITRE**, *goi'tér*, an enlargement of the thyroid gland which may occur sporadically or be endemic. Isolated cases occur the world over. In the United States the disease is comparatively prevalent around Lake Ontario and in parts of Michigan. It is found endemically in the mountainous regions of Switzerland and Italy. The cause is unknown, although certain claims are made that the water is responsible. The symptoms of goitre consist of a more or less uniform enlargement of one or both lobes of the thyroid, causing a puffiness either on one side or both sides of the neck about the region of Adam's apple. When small, no inconvenience is caused thereby, but if the growth becomes extensive, pressure on the important structures of the neck may result in difficulty in breathing, and occasionally sudden death has resulted. Tumors of the thyroid glands such as carcinoma and sarcoma sometimes simulate goitre. One form of goitre, due to abnormal thyroid function, is known as Graves' disease. (See EXOPHTHALMIC GOITRE). Consult article on 'Goitre' in Osler's 'Modern Medicine' (2d ed., Philadelphia 1914) and McCarrison, 'Etiology of Endemic Goitre' (London 1913).

**GOKCHA**, *gök-chä'*, **GOKTSCHA**, or **SEVANGA**, *sä-vän'gä* a lake in Erivan, in Transcaucasia, Russia. It is 6,400 feet above the sea and has an area of about 540 square miles. A large number of small streams flow

into it, but the outlet, the Sanga, which flows into the Aras, seems to convey only a small portion of the waters to the Caspian Sea.

**GOLCONDA**, India, a fortress and ruined city of the Hyderabad state, situated on a granite ridge, five miles west of Hyderabad, India. In its immediate neighborhood are the ruins of an ancient city, once the metropolis of the powerful kingdom of Golconda, which reached its height at the close of the 16th century and endured till 1687. The place itself is still strong; and about half mile to the north are the solid mausoleums of its former sovereigns. The fort is held by a small garrison from Hyderabad. Golconda is proverbially famous for its diamonds; but they were merely cut and polished here, as no diamonds are found in the vicinity.

**GOLD** (chemical symbol, Au, atomic weight, 197.3); a metal distinguished from other common metallic elements by its beautiful characteristic yellow color which it preserves untarnished on exposure to the atmosphere under nearly all conditions. Many alloys of copper with zinc, tin and aluminum have also a more or less golden-yellow color, and are used as substitutes for and imitations of gold, being sold under various fanciful names, such as Dutch metal, Mannheim gold, Abyssinian gold, etc. Some of the bronzes have also a golden color. None of these resist atmospheric action like gold, but some are fairly permanent under ordinary conditions. Pure gold has a high metallic lustre, but is inferior in this respect to steel, platinum and silver. The metal possesses a higher specific gravity than any common metal, but is exceeded in this respect by platinum. The specific gravity varies from 19.2 to 19.4, and the metal is thus one and one-half times heavier than lead and nearly twice as heavy as silver, bulk for bulk. Gold melts at 1,045° C., being somewhat less fusible than silver and more fusible than copper. It does not melt in a common fire. At high temperatures the metal is sensibly volatile, and in the intense heat of the oxyhydrogen blowpipe or electric furnace may be vaporized. The vapor is purple.

The pure metal is somewhat harder than lead, but softer than copper, silver, platinum, zinc or iron. It is consequently too soft, in the pure state, for the purposes to which it is generally applied. For practical application it is alloyed with copper or silver, and both these metals are often present. The former renders the gold redder and the latter paler than its true color. The proportion of gold contained in an alloy is expressed in degrees of fineness, or as "carats"; fineness is expressed in parts per thousand, for example 916.6, or decimally, .9166; the carat value of the gold is expressed in parts of .24, pure gold being 24 carats fine. Thus 9-carat gold contains 9 parts of pure gold and 15 of some alloy. Sovereign gold consists of 11 parts gold and 1 copper; guinea gold, of 11 parts gold, ½ part of copper and ½ part of silver. Standard and guinea gold are thus 22 carats fine (the legal standard for coins in the United Kingdom and colonies), and contain only two parts of alloy. The German, American and Italian standard is 21.6 carat, and is composed of one part copper and nine gold. The follow-

ing table shows the relative amounts of gold and baser metal in alloys commonly employed:

Carats Fine	Pure Gold	Alloy	Finest in thousands
24	24		1000.00
22	22	2	916.66
21.6	21.6	2.4	900.00
18	18	6	750.00
15	15	9	625.00
12	12	12	500.00
9	9	15	375.000

The lowest recognized standard is nine carat, but much gold of inferior quality is worked up into ornaments and commonly sold as real gold. Derby gold is also a common name for this poor material. In the United Kingdom articles of jewelry, plate, etc., are stamped with certain marks known as hall marks, or plate marks, as a guarantee that they have the quality they profess to have. Tampering with hall-marked articles is an indictable offense. Many specious imitations of hall marks are put upon sham jewelry, but always differ in some essential feature. Gold alloys of a red character are frequently colored. This consists in treating the article chemically in such a manner as to dissolve out the base metal constituting the alloy, leaving a covering of purer gold, paler than the original. For this purpose the articles are boiled with one part of salt, one of alum, two of saltpetre dissolved in four parts of water, for 20 minutes. Rolled gold is produced by applying thin sheets of gold to a plate of alloy and rolling down.

Pure gold has a tenacity of about seven tons per square inch, and elongates about 30 per cent before breaking. A wire one-tenth of an inch thick will support nearly 200 pounds. Its alloys with copper and silver are stronger. Standard gold has a tenacity of 18 tons (Austen), and extends 34 per cent before breaking. At very low temperatures this is greatly increased (Dewar). Gold is the most malleable of metals, and can be reduced to extremely thin leaves by hammering. (See GOLD-BEATING). Such leaves sometimes do not exceed  $\frac{1}{1000}$  of an inch in thickness, and transmit green light, though presenting an unbroken metallic surface. This is best seen by mounting on glass. The extreme thinness and high lustre of the metal have led to its use as an illustration of the extreme divisibility of matter. A particle of gold weighing only  $\frac{1}{1000000}$  of a grain is readily visible to the naked eye. A grain of gold can be made to cover nearly 80 square inches of surface. The malleability of gold is seriously affected by the presence of minute quantities of arsenic, antimony, bismuth, lead, sulphur, selenium and tellurium. Of the last 0.2 per cent, and of bismuth 0.5 is sufficient to render the metal crystalline and brittle. Traces of the above elements unfit the metal for gold-beating and coinage. These are removed by passing chlorine gas through the molten metal, or by treating the molten metal with mercuric chloride (corrosive sublimate). By continued hammering the metal is slightly hardened, and must be annealed. Gold surpasses all other metals in respect of ductility. The extreme ductility of the metal is shown by the fact that wires less than  $\frac{1}{1000}$  of an inch thick were obtained by Wollaston by encasing a wire of gold in silver

and drawing down the compound wire. The silver was dissolved off by treatment with nitric acid. A length of 500 feet of such wire weighs only one grain. Gold wire is used for making gold lace. Gold is also extremely flexible and tough. Gold comes from the refinery in the form of bullion bars, and has to be assayed to determine its value. The bulk of it goes to a mint for coining. In the United States, on reaching the mint, the gold is melted with 10 per cent of copper and recast into ingots of a convenient size for coining. See COINAGE.

**Chemical Properties.**—Gold alloys readily with most metals. It is rapidly attacked by mercury, and dissolves in excess of that metal. If the liquid amalgam be squeezed through wash-leather a yellow pasty mass remains, which may be used in "wash" or "fire" gilding. This process, however, has been largely displaced by electro-gilding, in which the bath consists of the double cyanide of gold and potassium, and is used hot. The metal is unattacked by any of the simple acids, save selenic, but dissolves in any mixture in which chlorine, bromine or iodine is liberated. The common solvent is aqua regia, a mixture of one part nitric acid and three or four of hydrochloric acid. The chlorine liberated from this mixture converts the gold into the trichloride, an exceedingly soluble body of high tinctorial power, yielding yellow solutions. In the finely-divided state gold is dissolved by chlorine water, bromine water and iodine solution or tincture, the trichloride, tribromide and triiodide being produced. It also dissolves in potassium cyanide solutions (in the presence of air) and in cyanogen bromide. These solvents are employed in the extraction of gold from its ores. Oxides of gold can be prepared with some difficulty. The monoxide is thrown down when caustic potash is boiled with gold chloride solution to which a little acetate of soda has been added. A trioxide ( $\text{Au}_2\text{O}_3$ ), a dioxide ( $\text{Au}_2\text{O}_2$ ), and a tetroxide ( $\text{Au}_4\text{O}_4$ ) are also known. What is known as fulminating gold,  $\text{Au}_2\text{O}_3(\text{NH}_3)$ , may be prepared by adding ammonia to a solution of gold chloride or by steeping the hydroxide in ammonia. It is a green or brownish powder, which detonates violently when gently heated or when struck. Two classes of gold salts exist. Of the aurous salts, the principal are sodium auro-sulphite, auro-thiosulphate, the cyanide and potassium auro-cyanide. Of the auric salts, the principal are the trichloride and the chlor-aurates. Gold trichloride crystallizes from solution in dark orange-red crystals,  $\text{AuCl}_3 \cdot \text{H}_2\text{O}$ . It is extremely soluble in water, and volatilizes at  $300^\circ$  in a stream of chlorine gas, but is decomposed on heating to  $200^\circ$  in air with the formation of the monochloride and chlorine, and, at a higher temperature, of gold. It is soluble in ether, naphtha and essential oils.

The chlor-aurates are combinations of gold chloride with sodium, potassium and other alkaline chlorides. The best known are  $\text{KCl} \cdot \text{AuCl}_2 \cdot 2\text{H}_2\text{O}$ , and  $\text{NaCl} \cdot \text{AuCl}_2 \cdot 2\text{H}_2\text{O}$ , salts commonly sold as gold chloride for photographic purposes. Gold is precipitated from solution by most metals. Iron, copper and zinc precipitate it readily, generally in a more or less pulverulent form devoid of metallic appearance. Oxalic acid, ferrous sulphate, sulphur dioxide and sodium sulphite, carbon,

grape-sugar and many organic reducing agents, precipitate the gold from gold chloride. In some cases the metal is so finely divided that it imparts a ruby color to the liquid and does not settle for months. Purple of Cassius is the fine purple pigment produced by treating gold chloride solution with a mixture of tin chlorides, that is, stannous chloride containing a little stannic salt. It is used in glass staining, pottery and enamel painting, and for coloring artificial gems, imparting a pink, rose or red color. The addition of tin chloride to the solution obtained by treating an ore with aqua regia and boiling off the excess acid is a delicate test for the presence of gold. Finely divided gold imparts to pottery and glass a color varying from pink to ruby. Gold resists chemical action to a greater extent than platinum or any other common metal, and in alloys protects base metals from the action of acids to a remarkable extent. Owing to the high specific gravity of gold (19.3) it is possible to roughly determine the richness of the alloy by taking the specific gravity of the article. This is impossible where platinum (specific gravity 21.4) is present in the alloy. The specific gravity of standard gold is 17.157, and of 18-carat gold 16.8.

**Assay of Gold.**—The touchstone is employed to determine approximately the quality of the gold. It is a hard, black, silicious or flinty slate known also as Lydian stone. Basalt and black Wedgwood ware are also employed. The metal to be examined is rubbed on the stone (any plating or coloring being first scraped off), and the streak compared with that made by needles of known composition differing from each other by one-half carat. The streak is also treated with nitric acid and a test acid, and the result of their action observed. Three or more sets of needles are employed, the chief being a gold-copper series, a gold-silver series and a gold-silver-copper series. Sometimes five sets are employed, in which the proportions of silver and copper are varied. The series to which the article tested belongs is determined by comparison for color, hardness and toughness, the latter being inferred from the dryness or greasiness of the streak. The streak is first treated with pure nitric acid (applied with a feather), which is afterward rubbed off. With brass and other spurious copper alloys the streak is completely and instantly dissolved, while poor gold leaves a very faint impression. Nitric acid does not affect any alloy above 15 carats fine. A test acid consisting of 98 parts nitric acid (specific gravity 1.34) and two of hydrochloric acid (specific gravity 1.173) is used if the streak has been unaffected by the nitric acid. Gold of 18 carats fine and over is not affected by this mixture in the cold. This method of testing is only used when a rough idea of the richness is all that is necessary for valuation purposes.

Accurate assays of gold alloys are made by wrapping a weighed quantity (either five grains or 0.5 gram) in sheet-lead, with sufficient silver to equal three times the weight of pure gold present. Lead to the amount of 34 times the weight of the sample is used for all alloys containing less than 50 per cent of gold, and less for richer alloys. The sample is dropped on to a bone-ash cup (cupel) previously heated to

full redness in a muffle furnace. The copper and all base metals in the alloy are oxidized, and the oxides dissolved in the molten litharge formed by the oxidation of the lead added. The fused oxides are absorbed by the porous cupel, thus keeping the metallic surface clear, and at the end of the operation only silver and gold remain behind. After cooling, the button is rolled into a ribbon, annealed, coiled up and boiled first in nitric acid of 1.16 specific gravity, and afterward in nitric acid of 1.26 specific gravity, to dissolve out the silver, and after washing the coherent corner of gold is heated to dull redness in an annealing cup and weighed. The addition of silver in assaying is known as inquartation. It is necessary owing to the protective action exerted by gold on other metals.

**Origin and Occurrence.**—In nature gold usually occurs native, that is, uncombined. Less commonly it is found in combination with tellurium, as tellurides, of which calaverite ( $\text{AuTe}_2$ ) is a well-known example. The native gold is often mixed with iron pyrites, the mixture being called auriferous pyrite. Both the tellurides and the auriferous pyrite usually occur in fissure veins in the rock, into which position they are usually believed to have been introduced by hot waters from deep seated igneous activity. The Cripple Creek district represents the type of the telluride deposits, and the Mother Lode in California the type of native gold and auriferous pyrite. When gold bearing veins of this sort are exposed at the surface the rock weathers faster than the gold. As the lighter rock particles are washed away the heavier gold remains behind associated with gravels in the form of placer deposits. California and Alaska have been the great placer districts of the United States. See **PLACERS AND ORE DEPOSITS; GOLD MINING AND METALLURGY.**

**World Distribution of Gold.**—Gold is very widely distributed, smaller or larger quantities being found in nearly every country. The ancients obtained gold from the Spanish Peninsula, Greece, Asia Minor and India. The Ophir of the Bible has been variously located. Possibly it was in East Africa. In more modern times Peru, Bolivia, Brazil, Chile, Mexico and other countries of South and Central America furnished immense supplies of gold after the discovery of America until about 1850. By far the greatest discoveries of gold were made during the 19th century. The discovery of the Californian placers in 1848, and of the Australian placers in 1851, produced a mad rush to the diggings. In 1858 gold was found in New Zealand, and in 1861 the Otago district became a large producer. Since then immense developments have taken place. Besides California, Colorado, Montana, Arizona, South Dakota, Nevada, Idaho and others of the United States have furnished, and still furnish, large supplies. and Alaska and the Philippines must also be added. British Columbia is an important source, both alluvial and quartz mining being followed. Canada has also entered the lists as a gold-producer, and the phenomenal deposits at Nome and in the Klondike region in the Yukon Basin continue to be a productive field. The rich finds in western Australia, in the Calgoorlie and Coolgardie districts, some years ago, placed that colony in the front rank as a

gold-producer, while Victoria, South Australia and New South Wales have long been large gold-producing countries. In Victoria much energy in the development, more especially of "deep lead" mining, is being put forth. The Witwatersrand district of the Transvaal has sprung into importance since 1886, and Johannesburg is now the largest gold-mining centre of the world. Russia is also an important producer, the gold being obtained beyond the Ural Mountains. India also produces a considerable amount. Of the prospective gold fields the most likely are British Guiana, the hinterland of the Gold Coast, certain parts of China and East Africa. Gold has been found in several parts of the United Kingdom, principally around Dolgelly, in Merionethshire, in Sutherlandshire, in the Lead Hills, in the Wicklow Mountains and other places in Ireland. For world's production of gold see table under GOLD MINING AND METALLURGY.

The total gold production of the world from the discovery of America by Columbus to the year 1916 is estimated to be \$16,616,991,763. Pure gold of this value would weigh about 20,500 tons, and occupy a space equal to 33,400 cubic feet. Graphically this amount could be represented by a solid circular tower of gold 20 feet in diameter and 138 feet high. The total yearly world production of gold since 1908 would have increased the height of such tower about three and one-half feet each year.

The world's stock of gold is variously estimated; it cannot be positively known, as much of it is in jewelry, tableware, etc., in the hands of individuals. Some idea of the old gold industry may be gleaned, however, from the fact that the "sweep smelters" of the United States, who handle sweepings of the precious metals from refineries, and old gold and jewelry, did a business of \$22,000,000 in 1909. The gold leaf and foil industry is also credited with using about \$1,000,000 of gold annually. The latest estimate of the world's gold, \$9,000,000,000, is therefore probably below the real total. The United States, before the European War, was credited with nearly \$2,000,000,000; Great Britain over \$1,600,000,000; France, about \$1,200,000,000; Russia, \$1,000,000,000, and Germany, \$1,000,000,000. Many have thought the German total an underestimate. Conditions have tended to increase the United States stock of gold, as this country's exports have vastly exceeded the imports, and America is now far in the lead as a money centre.

**United States.**—The total yield of the mines of the United States from the first official records of 1792 to the close of the year 1916 has been 185,226,085 fine ounces, valued at \$3,828,957,200. The 1916 output of 4,479,036 ounces, valued at \$92,950,300, was won from seven various sources, as follows: 63.30 per cent (\$57,799,310) from dry or siliceous ores; 25.06 per cent (\$22,881,663) from placers; 9.07 per cent (\$8,286,290) from copper ores; 1.63 per cent (\$1,486,754) from lead ores; 0.65 per cent (\$589,950) from lead-zinc ores; 0.19 per cent (\$171,624) from zinc ores, and 0.10 per cent (\$92,039) from copper-lead and copper-lead-zinc ores.

In 1916 there were in active operation in the country 5,268 mines producing gold, 3,201 of these being deep or lode mines, and 2,067

placer mines. These figures include silver mines which also produce gold as a by-product. The largest number of mines in any one State is 852 in Colorado; 825 of these are deep mines and 27 placers. In Nevada there were 714 deep mines and 65 placer mines; a total of 779. In Alaska there were 697 mines; 650 being placers and 47 deep mines. California has 589 mines; 297 of them deep mines and 292 placer mines. Arizona has 527 mines; 504 deep mines and 23 placers. Montana has 393 deep mines and 120 placers; a total of 513. The 1916 output was produced chiefly (nearly 99 per cent) by 10 States, with Alaska and the Philippines. See table under GOLD MINING AND METALLURGY.

In California the gold production is in part from deep mines yielding hard quartz ores, and in part from placers. The deep mines in 1916 yielded \$12,835,084, of which 7.2 per cent came from the ores of copper mines. The placers yielded \$8,575,657, of which \$7,769,227 was recovered by some 60 dredges operating in many sections of the State, but chiefly in Yuba, Sacramento and Butte counties.

In Colorado more than 92 per cent of the 1916 output came from deep mines; about 4 per cent from placers (worked by dredges), and the remainder from lead and copper ores. Two-thirds of the total yield came from the Cripple Creek district, where the Roosevelt tunnel was advanced 2,311 feet during the year; making its entire length at the close of 1916 about 22,000 feet.

In Alaska the output was nearly two-thirds from the placer diggings, less than one-fourth of the placer gold being gained by the dredges. A little over 1 per cent was recovered from the copper mines, and the remainder from deep mines—nearly all from the group of 13 low grade ore mines in southeastern Alaska.

Nevada's 1916 output was gained nearly all from deep quartz mines, and about half from the Goldfield and Tonopah districts.

South Dakota's output came almost wholly from low grade siliceous ores.

The balance of imports and exports of gold for the calendar year 1916 shows a gain by the United States of \$530,197,307. The imports were chiefly of foreign bullion, \$514,425,434; of foreign coin, \$155,034,343; and gold in foreign ore and base bullion, \$13,402,002. The exports were in largest items: United States gold, \$106,903,188; domestic-refined bullion, \$27,671,406; and foreign coin, \$20,885,877. It is notable that the excess of imports over exports is \$73,000,000 more than the entire world's production of gold for the year.

**GOLD, Refining of.** See ELECTROCHEMICAL INDUSTRIES.

**GOLD-BEATERS' SKIN,** a skin or membrane of great tenacity used in gold-beating (q.v.), and specially prepared from the outer coat of the caecum of cattle. The intestines of 500 cattle are required to make a single packet or "mold" of gold-beaters' skin, the mold containing about 850 leaves, between which the gold to be hammered out is laid. See GOLD-BEATING.

**GOLD-BEATING,** the art of hammering gold into leaves of extreme thinness for the purposes of ornamental gilding. For this pur-

pose pure gold is alloyed with small quantities of other metals according to the color required. Ten colors are recognized: red, pale-red, deep-red, orange, lemon, deep-pale, pale, pale-pale, deep-patty, party, besides fine gold. In the deeper colors copper preponderates in the alloy, varying from  $\frac{1}{2}$  dwt. to  $\frac{3}{4}$  dwt. per ounce, and no silver. The pale ones contain silver varying from a few grains to 1 dwt. per ounce. The middle ones contain from  $\frac{3}{4}$  to a little over 1 dwt. of alloy, of which  $\frac{3}{4}$  is silver and  $\frac{1}{4}$  copper. Ordinary gold-leaf contains about 21 grains of alloy per ounce and is thus nearly 23-carat fine. The operations are conducted as follows: The metal is melted and cast into ingots, which are rolled out into thin ribands between polished steel rolls. Each ounce of gold is rolled to a length of about 10 feet, the riband being  $1\frac{1}{2}$  inches wide and .00015 to .001 inch thick. This is cut up into pieces, each weighing about 6 grains, so that 2 ounces—that is, a "beating"—yields 160 to 170 such pieces. These are packed between intervening sheets of vellum, some 3 inches square, the surfaces of which have been rubbed over with fine plaster of Paris—brime—to prevent the gold from sticking. A number of blank pieces of vellum are placed at the top and bottom of the pile and the packet is bound with straps of the same material. The cutch thus formed is beaten with a hammer weighing from 17 pounds upward, or by a power hammer, till the gold has been extended to the size of the parchment sheets. The packet is then unbound, the gold squares each divided into four by a steel knife and the pieces packeted between sheets of gold-beaters' skin (q.v.) about  $4\frac{1}{2}$  inches square. A number of blank skins are placed at both top and bottom. The 600 to 700 pieces are all put into the same packet and comprise what is called the shoder. The shoder is secured by slipping the pile into a parchment band and again into a similar one at right angles, and is beaten with a round-faced hammer weighing from 9 to 12 pounds, until the gold has extended across the skins. When the gold has filled the shoder each leaf is divided into four pieces with a strip of bamboo sharpened on the long edge. The 2,500 to 2,800 pieces thus obtained are packed in three packets between fine gold-beaters' skin, 5 inches square. Each of these packets constitutes a "mold." A large number of blank skins are placed at either side. The packet is secured as before and each mold is beaten with the "finishing" or gold hammer, weighing from 7 to 10 pounds, till the metal extends to the edges of the skins, and in some places flows over. When the beating is finished the mold is opened. Each leaf is then lifted deftly by long wooden tweezers, placed, with a sudden downward movement, on a leather pad dusted with brime, and from the central part leaves  $3\frac{3}{4}$  inches square are cut by means of two sharpened bamboo strips fastened parallel to each other. The leaves are placed by the tweezers in books of soft paper rubbed over with red ochre, red bole and brime to prevent the gold from sticking. If the leaf does not lie flat, a sudden puff of breath, well directed in the centre, lays it flat. Each book contains 25 leaves. Fine gold is more difficult to deal with than that containing

a little alloy, owing to its liability to stick when the leaves touch. It, however, beats equally well. The leaf begins to transmit light when ~~some~~ of an inch thick. Ordinarily gold-leaf varies from ~~some~~ to ~~some~~ of an inch thick.

**GOLD-BUG, The.** 'The Gold-Bug,' by Edgar Allan Poe, belongs to the group which the author called Tales of Ratiocination. This type of story, which was virtually created by Poe and which is exemplified in the many detective stories written since his day, deals with the solution of a mystery, and has two climaxes—the first where the explanation is made known, the second where the method of discovering the explanation is revealed. It is usually told by a friend or semi-confidant of the person who evolves the solution, since by this device the author is able to present more easily details in the order necessary to produce the greatest effect. 'The Gold-Bug' tells of the discovery of buried treasure through the reading of a cipher memorandum and the scene is laid on an island near Charleston, S. C. As a tale it is remarkably well knit, and repeated readings will discover new instances of seemingly trivial details which are introduced because of their relationship to something in another part of the story. The gold-bug itself, which gives the title, is cleverly used to mislead the reader and to throw him off the true scent when the writer so desires. The work was first published as a prize story in the *Philadelphia Dollar Newspaper* in 1843 and appeared in the volume of Poe's tales issued in 1845. In Poe's lifetime, at least, it was the most popular of his prose pieces, but the author sometimes spoke of it rather slightly. His other chief tales of ratiocination which may be grouped with it are the detective stories in which the character of Dupin appears—the 'Murders in the Rue Morgue,' the 'Purloined Letter' and the 'Mystery of Marie Rôget.'

WILLIAM B. CAIRNS.

**GOLD COAST COLONY,** a British crown colony on the Gulf of Guinea, West Africa, bounded on the east by Togoland (German) and on the west by the Ivory Coast (French). Its coast line is about 350 miles; its area, inclusive of Adausi, Ashanti and the Northern Territories, is about 80,000 square miles; Gold Coast, 24,200; Ashanti, 20,000, and Northern Territories, 35,800 sq. miles. Pop. 1,503,386, including Europeans, 1,900 (Gold Coast, 853,766; Ashanti, 287,814; Northern Territories, 361,806). The native state of Ashanti lies inland, at the back of the central portion of the colony. The territories in the hinterland to the north of Ashanti were erected into a separate district, the Northern Territories, in 1897 and placed under the administration of a commissioner. The products are chiefly palm oil, gold, palm kernels, rubber, timber, etc. The revenue for 1914 was £1,331,713; expenditure, £1,755,850. The imports (including bullion and specie), £4,456,968; exports, £4,942,565. Public debt (1914), £3,464,118. Tonnage entered at ports (1914), 2,812,776 tons. Railways have been built from Seccondee to Coomassie (168 miles), and from Akkra to Mangoaze (40 miles). There are 1,653 miles of telegraphs

in the colony. Chief towns, Akkra, the capital, pop. 19,585; Coomassie, 18,853; Cape Coast Castle, 11,364. The government includes a governor, an executive council and a nominated legislative council of nine. Trouble arose between the king of Coomassie, who had declared himself king of Ashanti in 1894, and the British authorities, and in 1895 an expedition was sent against him, under the command of Sir Francis Scott, which resulted in the submission of the king, who was afterward taken to the coast. The kings of Bekwai and Abodom also made their submission, and the country was placed under British protection, and a resident appointed at Coomassie. The Niger Convention, drawn up by the Anglo-French Commission sitting at Paris, and signed 15 June 1898, and the agreement of Germany 1899, settled the boundaries of the hinterland to the west and the north. Bona and Dokta were given up to France and the French had to concede Wa and other points to the east of the Volta, which had been occupied by them.

**GOLD COINAGE IN THE UNITED STATES.** The Constitution having assigned to the Federal government exclusively the right of coinage, the Secretary of the Treasury (Hamilton) in 1791 reported a plan for the establishment of a mint, and the Mint Act was passed 2 April 1792. In that act provision was made for the coining of gold, silver and copper—of gold eagles (\$10), half-eagles (\$5) and quarter-eagles (\$2.50); of equivalents of the Spanish dollar, designed to contain 371 4/16 grains of pure silver (416 grains of standard silver); and at the bottom of the list, copper cents, although the decimal system was adopted in principle, and that called for dimes and mills as well as for dollars and cents. Now, if we overlook, as is indeed customary, the smallest subsidiaries, it may be proper to say that a "bimetallic" system was thus adopted. The ratio of gold to silver—the two metals then, and anachronistically still sometimes, called precious—was 15 to 1; and the standard of fineness of coins made chiefly of gold was 11/12. The mint was established at Philadelphia: the opportunity for coinage was both free to all persons and gratuitous, exactly as instruction and training at a public school, turning the children taken there into scholars, was free and gratuitous.

So the coinage laws stood until 28 June 1834, when the weight and fineness of gold coins were reduced (the weight of an eagle from 270 to 258 grains, and its fineness from 916.66 to 899.225 in 1,000). Here we note the beginning of—or the recognition for utilitarian purposes of—the amended ratio of gold to silver; since under this act it became approximately 16 to 1 instead of 15 to 1. On 18 Jan. 1837 the fineness was made 900 to 1,000, at which standard it has remained ever since. A sufficient explanation of those changes (1834 and 1837) is found in the statement that gold was underestimated at the mint under the older mint-ratio of 15 to 1; in consequence of which little or no gold was taken thither for coinage; moreover the old coins, minted during the first part of the century, were withheld from the general circulation.

A reversal of the above-mentioned policy of gratuitous coinage occurred 21 Feb. 1853, when

a charge was imposed of one-half per cent for coining either gold or silver. Then, too, or during that mid-century period, important new coins were authorized: in 1849 the double-eagle and the gold dollar; in 1853 the gold three-dollar piece. Twenty years later (1873) a thorough revision of the coinage laws had, as a noteworthy result, the establishment of the one-dollar gold-piece of 25.8 grains, 9/10 fine, in the post of honor—that of the unit of value. Again, after an interval of about 17 years, the purchase of silver was increased under the Sherman Act of 1890, although the coinage of silver dollars was conditioned upon the number of them required to redeem the treasury notes issued in compliance with that act's requirements; and in the same year the coinage of the one- and three-dollar gold pieces was discontinued. But in 1893 the Sherman Act was repealed. Seven years later the so-called Gold Standard Bill (14 March 1900) was enacted "to define and fix the Standard of Value, to Maintain the Parity of All Forms of Money Issued or Coined by the United States, to Refund the Public Debt, and for Other Purposes." It provides that the dollar of 25.8 grains of gold, 9 fine, shall be the standard unit of value, and all forms of money issued or coined by the United States shall be maintained at a parity of value with this standard, and it shall be the duty of the Secretary of the Treasury to maintain such parity. All United States notes and treasury notes issued under the act of 14 July 1890 shall be redeemed in gold coin as above, and to secure this the Secretary of the Treasury is directed to set aside a reserve of \$150,000,000 in gold coin and bullion, to be used for such redemption purposes only. If this reserve falls below \$100,000,000 despite certain assigned methods of replenishing it, the Secretary shall pledge the credit of the United States by issuing bonds at not exceeding 3 per cent interest, payable quarterly, exempt from all taxation. This is not to interfere with the legal-tender quality of silver money already in circulation. As fast as silver dollars are coined under previous acts, an equivalent amount of treasury notes shall be retired and silver certificates issued instead. The coinage of subsidiary silver coins, and the recoinage of such as are out of circulation, are provided for. This act is not to prevent international bimetalism if it is found possible to secure a stable relation between gold and silver.

The total coinage, 1793–1911, was \$4,304,288,083, divided as follows: Gold, \$3,271,514,410; silver, \$971,904,364; subsidiary or minor, \$60,869,308. The gold coins minted have been (in millions): Double-eagles of the years 1850–1911, \$2,350.0; eagles of the years 1793–1804, and again of 1838–1911, \$492.1; half-eagles of the years 1793–1911, \$370.0; quarter-eagles of the years 1796–1808, and again of 1821–1911, \$38.1; dollars of the years 1849–1889, \$19.8.

The coinage laws make careful provisions in relation to the abrasion of gold coins. Any coin which has been reduced in weight by natural abrasion more than one-half of 1 per cent below the weight required by law ceases to be legal tender for its face value. For example, a double-eagle, of which the

standard weight is 516 grains, is not legal tender after losing more than 258 grains. Consult McLaughlin, A. C., and Hart, A. B., 'Cyclopedia of American Government' (New York and London 1914); and for lists of all countries wherein we find the gold standard or the gold exchange standard, and the gold units employed in those countries, with the value of each gold unit in terms of gold dollars of the United States, consult Gonzales, V., 'Modern Foreign Exchange' (New York 1914).

**GOLD CONSPIRACY.** The. A corner in gold created in the summer of 1869 by Jay Gould and James Fisk, Jr., the "absolute irresponsible owners of the Erie Railway." Gould figured that if gold should rise to 140 or 145 the British market would buy breadstuffs here, and by this means he could induce the farmers to ship all their grain east. The movement of crops would turn over an enormous and continuous amount of freight to the Erie and Gould would enrich himself from both ends of his dealings. (For the results of the conspiracy see **BLACK FRIDAY**; also **CORNER**). Consult 'Testimony in the Gold Panic Investigation, Report No. 31, 41st Congress, 2d Session'; Gould's testimony before the Garfield Committee; Adams, H., 'New York Gold Conspiracy' (in 'Historical Essays,' pp. 318-337, New York 1891); Boutwell, G. S., 'Reminiscences of Eighty Years in Public Affairs' (New York 1902).

**GOLD-CREST, or GOLDEN-CRESTED WREN.** The British name for one of the Kinglets (q.v.).

**GOLD DREDGING.** See **GOLD MINING.**

**GOLD LACE,** a kind of lace made of gold wire, flattened between two polished steel rollers into a ribbon which is twisted round a core of silk. In India "gold wire" used in the manufacture of gold thread is nearly always composed of pure silver with a thin coating of gold. But in European countries it is only the very best qualities of this wire which are made of unalloyed silver. A good quality of English gold thread is made from wire consisting of 1 part of copper added to 25 of silver, which is afterward coated with gold. But alloys of copper and silver in many proportions are used, some wire containing only 1 part of silver to 60 of copper. The silver, or alloy of copper and silver, is made into a rod  $1\frac{1}{4}$  inches in diameter, and then annealed and polished to prepare it for its coating of gold. This is laid on in the form of leaves of pure gold, and subjected, for the best qualities of wire, to the fire-gilding process—that is, the gold-coated rod is heated to redness on burning charcoal, which causes the leaf to adhere firmly. Rods so treated are next smeared with wax, and drawn through the holes of a steel draw-plate. (See **WIRE AND WIRE-DRAWING**). The wire is frequently annealed during the process of drawing, and this requires to be very skillfully done, or the golden tint of the surface is lost.

Gold for thread is generally drawn down to a size measuring 1,100 to 1,400 yards to the ounce of metal. Finer sizes reach the length of 1,800 to 2,000 yards to the ounce, and to attain this fineness the wire is drawn through

perforated gems, such as diamonds or rubies. The fine wire, after being annealed, is flattened between polished steel rollers. Finally the flat wire, or rather ribbon, is wound over yellow or orange colored silk, so as completely to envelop it, by a spinning engine. The gold thread is then finished. Some of the best qualities of the metal covering or "plate" of this thread have 12 pennyweights of gold to the pound of silver or of alloy. Inferior kinds have as little as 2 pennyweights to the pound, and still cheaper sorts of thread are covered with flattened copper wire which has received a thin coating of electro-deposited silver, and this afterward receives, on the outside of the thread only, a still thinner electro-deposited coating of gold—two grains of the precious metal covering 3,000 square inches of surface. For this very cheap kind of thread yellow cotton is used instead of silk.

The only difference between gold and silver thread is that the thin coating of gold is wanting on the latter. Gold thread is used in the manufacture of military lace. This, however, is a woven substance and not true lace; but some real lace is made both of gold and silver thread. Both kinds of thread are also used for facings of liveries, and for ecclesiastical robes, altar cloths and banners. These and other fabrics are either embroidered or woven, but often only in part, with the thread. (See **BROCADE**; **DAMASK**; **EMBROIDERY**). Much of the "gold thread" used for theatrical dresses and decorations has only a covering of Dutch metal, and the "silver thread" in these is spun with a covering of a cheap white alloy, having a mere film of silver on the surface.

**GOLD MINING AND METALLURGY.** Gold is found in nearly all parts of the world and small amounts occur in ocean water and in many rocks. It is mostly in such minute proportions, however, that it cannot be profitably extracted and only the more concentrated deposits can be utilized and some of these only where natural conditions are favorable. It occurs in all formations from Archean to Quaternary and in part in association with various other metals as silver, copper, tellurium, lead and iron. The pure metal usually occurs in connection with silica or quartz, so that lode and vein gold mining is generally known as quartz mining. Gold has always been precious and difficult to obtain and never has been found so plentiful as to still the desire for its possession. In its search and exploitation, nature has generally demanded full toll in labor and effort. With early, primitive methods only the easily accessible, pure gold was obtained, but as machinery was developed and processes of extraction perfected, mining was extended to the less rich deposits. This development has progressed in other lines of mining so that within the last 25 years the production of iron, copper, coal and petroleum has been greater than the aggregate of all previous times.

**History of Gold Mining.**—The earliest records of gold mining are from Egypt, where pictorial rock carvings indicate the breaking up of ore by stone hammers, its grinding in stone mills, and treatment with water on stone tables. Shallow earthen dishes were used for final washings. Inscriptions on monuments indicate that gold washing was done as early as 4000

B.C. The Argonauts' search for the Golden Fleece has been explained by the fact that fleeces have been used effectively to catch fine gold in ditches and flumes, and when much gold dust adheres it makes a veritable golden fleece. The Argonauts are supposed to have made their quest in the direction of the famous gold deposits of Colchis, west of the Caucasus. Herodotus, 484-425 B.C., refers to several great gold mining centres in Asia Minor, and Strabo, 63 B.C., and Pliny, 23-79 A.D., mention gold mining in many different places. Pliny gives many details of ancient placer mining, which was extensive, for the water used was carried great distances by long ditches which crossed valleys in aqueducts. In places ledges were cut away to make room for troughs of hollowed-out logs. These and other ancient writers clearly indicate that gold mining was carried on in Egypt, Asia Minor, Italy, Greece, Spain, France and India before the Christian era.

History gives no reliable records of the outputs of these different gold fields, but doubtless they were small as compared with modern returns. Rome's wealth in gold increased as she took possession of the world, and finally reached a high figure, but during the barbarian invasions this accumulation of gold was scattered, and gold mining languished in the Middle Ages.

In the 13th century discoveries in the Alps, Transylvania and various parts of Spain revived production. In the 16th century the discoveries of gold in Mexico, Peru, Colombia and Chile gave new life and system to gold mining and since that time the gold production of the world has been estimated with a fair degree of accuracy. Considering, however, the great part that metals have played in civilization, it is astonishing that we have but meager accounts of the details of their obtainment. Agricola's 'De re Metallica,' in 1556, gave the first extensive and reliable information, with maps or illustrations, of any class of mining. This work, written in Latin (translated by Mr. and Mrs. H. C. Hoover), is the beginning of accurate mining and metallurgical literature. In this work appliances and methods used in both alluvial and lode mining are described and illustrated. It shows that the principles of many of the modern devices used in placer and other mining had long been known. A primitive stamp mill is described, also the use of quicksilver, retorting, assaying, melting and refining of gold and silver. The relative extent of ancient and modern gold mining is shown in the following table, which gives the output from the world's mines, with average annual progressive showings from 1493 to 1917, inclusive:

The contributions of the most important countries, with dates of initial operations, are approximately as follows:

Approximate date of starting operations	Country	Output (in millions)
1792*	United States.....	\$3,913
1851.....	Australia.....	3,261
1886.....	Africa (Witwatersrand 2,572; all other Africa 691).....	3,263
1745.....	Russia and Siberia.....	1,566
1537.....	Colombia.....	939
1693.....	Brazil.....	787
1521.....	Mexico.....	502
1858.....	Canada.....	412
.....	China and Korea.....	281
1493.....	Austria-Hungary.....	216
1545.....	Chile and Bolivia.....	199
1884.....	British India.....	189
1533.....	Peru.....	128
1875.....	French, British and Dutch Guiana.....	150
1866.....	Venezuela.....	63
Total.....		\$15,869

Figures for the above table were obtained from De Launay's estimates to 1906 and United States Director of Mint's reports from 1907 to 1917, inclusive.

\* Gold mining in the United States started in the Appalachian States, which have produced over \$50,000,000; gold was discovered in California in 1848.

Gold mining is divided into two classes, placer mining and lode or quartz mining.

**Placer Mining.**—Placer, known also as alluvial, or alluvium, mining, is the operation of washing gold or other valuable minerals from gravel or sand, which is mostly alluvium deposited by a stream or in a beach, or as talus. It has been estimated by De Launay that between 1848 and 1875, 87 per cent was thus obtained, but lode or quartz mining has increased so that in 1876 placer mining produced only 65 per cent; in 1890, 44 per cent; in 1905, 15 per cent. In the future, placer mining may become still less important. New deposits can be looked for only in sections which have been covered by ice, snow and marshy turfs in polar regions; in forests of the tropics; in deserts, high valleys and mountain chains. Further returns may also be obtained from gravels too poor to yield profit under present conditions. Placer deposits have been classified as shallow, deep, creek, hillside, bench, river bar, gravel plain (tundra), sea beach, lake bed and dry placers. Such deposits have been the easiest to work for nature has done the major part of the mining and reduction work, and man has the concentrates for further treatment. Nature's process was erosion, and her tools, clouds, rain, ice, snow, glaciers, rills, torrents and rivers. These have carved out valleys, built up flats and by attrition milled or ground up the materials, carrying away the softest and lightest. Gold, being the heaviest

#### WORLD PRODUCTION OF GOLD, 1493 TO 1917, INCLUSIVE.

PERIOD	Total for period	Annual average millions	Remarks
1493-1600.....	\$501,640,000	4.6	From 1493 to 1885 estimates are by Dr. Adolph Soethoe; since 1885, by United States Director of Mint.
1601-1700.....	606,315,000	6.0	Start placer mining in Brazil, 1693.
1701-1800.....	1,262,805,000	12.6	
1801-1850.....	787,463,000	15.7	Start placer mining in California, 1848.
1851-1890.....	4,806,866,000	120.1	Start placer mining in Australia, 1852.

Total.....	\$17,020,725,318	40.0	

of known minerals, excepting platinum and a few other rare minerals, naturally works to the bottom of the streams and the coarser particles cling to the bed rock. The finer the gold dust the further it is carried down the river systems.

Most placer mining is done in the open and largely in connection with modern river systems. Some of the auriferous deposits, however, are covered by lava or other non-producing capping, which necessitates underground working tunnels, shafts, drives, slopes, etc. Such mining is known as drift or deep-lead mining and it has been done extensively in California and Australia. In most cases the pay dirt is in a few feet of gravel next to the bedrock, but in some such deposits yields high returns. After the gravel is mined and brought to the surface it is washed on floors connected with suitable sluice system. Auriferous gravel deposits with thickness of only a few feet or in banks of several hundred feet in thickness have been worked successfully. These gravels may contain boulders several feet in diameter, or pebbles graduating in size from a few inches in diameter to fine sands. The gold occurs in scales, grains or nuggets, and all particles are smooth and rounded, thus differing from vein gold which is sharp and angular, and often the particles, or "colors," of gold dust are so fine and scaly as to defy ordinary devices of catchment. The nuggets have varied in size from small grains to the Australian "Welcome stranger," weighing 2,520 ounces, valued at about \$42,000. The largest nugget found in California weighed 280 ounces. In Russia the largest, weighing 96 ounces, was found near Miask. The Klondike has produced an 85-ounce nugget. The greatest proportion of gold recovered is medium and fine gold dust.

**Prospecting Appliances.**—The miner's pan, made of stiff sheet iron, and flat-bottomed; the bateau, made of wood with conical bottom; and the horn spoon, cut out of ox horns, are used for testing the gravel and working the rich spots. These, with pick and shovel, and beans and bacon, were the old-time prospector's outfit. For small but rich deposits the cradle or rocker and Long Tom were long employed, but now they are rarely used.

**Sluice and Sluice Mining.**—The sluice is the mainstay of shallow placer mining. It is a long open box, made of rough boards usually in sections 12 feet long, with varying width and depth. The sides are protected from wearing by wooden liners renewed frequently. The bottom is protected and made effective for gold saving by a series of transverse or longitudinal riffles, or as in hydraulic sluices or flumes, with wood pavement of rounded blocks. The length varies with grade and other natural conditions favorable for disposal of tailings. The grades used vary from 2 inches to 20 inches per box (12 feet). Mercury is sprinkled in at the head of the sluice after washing has been in progress a short time. The charge of this metal varies with the richness of gravel and the magnitude of the work. A stream of water is turned in at the head of the sluice where the gravel is shoveled or dumped in. The amount of gravel mined and shoveled per man varies from 3 to 12 cubic yards per day. In sluice mining the sluices can be shifted to suit the mining or the gravel

conveyed to the sluice by different appliances. At many workings long stationary sluices are constructed with drops to facilitate disintegration of the gravel and with undercurrents to classify the gravel and provide special treatment for the finer and heavier material. These devices are used mostly in hydraulic mining. The riffles are taken out periodically, the gold washed from the concentrates by rocker and pan and the mercury separated from the gold by retorting.

**Hydraulic Mining.**—Hydraulic mining was introduced in California in 1852, to deal with huge deposits of low-grade gold bearing gravel favorably situated for obtaining the water necessary for washing, and also for the disposal of tailings or débris. It is necessary that abundant water supply should be available. Hydraulic mining differs from large scale sluicing only in that instead of using pick and shovel for mining and dumping the gravel into the gold saving sluices, the water excavates the gravel and débris and conveys them into large and strongly constructed sluices. Water is brought to the gravel deposits in ditches and flumes from reservoirs or streams many miles distant and at such a height that it can be used under a head of several hundred feet. It is conducted in pipes to "monitors" which throw great jets of water on the gravel banks, some of which are from 300 to 400 feet high. The nozzles of the larger monitors are from 8 to 10 inches in diameter and throw a stream of from 3,000 to 5,000 cubic feet per minute. The gravel banks are prepared for the washing by a loosening by explosives. These are used in a T system of small tunnels driven into the banks, the entering one being used for tamping, and the cross drifts for the reception of a heavy charge of black powder or low-grade dynamite sufficient to shake up but not scatter the gravel. After the jets of water have played upon the banks for a while, large boulders and lumps of pipe clay remain which have to be drilled and shattered by explosives to allow the water to convey them to the sluices. To wash a cubic yard of gravel, from 500 to 1,000 cubic feet of water is required. Under most favorable natural conditions and suitable equipment, operating costs have been as low as three cents per yard, but for most deposits, large outlays for the purchase of rights, storage and conveyance of the water, and for sluices and tunnels, etc., are necessary to yield satisfactory results. In 1882 all hydraulic mining in California dumping tailings into the Sacramento River was enjoined as detrimental to the navigation of the river and the "slikens" or fine sediment assumed injurious to the farm lands in the valley. This has been a serious set back to hydraulic mining.

**Gold Dredging.**—Gold dredging originated in New Zealand and Australia as early as 1865, but the endless bucket chain system was not started there until 1882. In Montana this system was started in 1894, and in California in 1896. The dredges were used first in active running water, as in river beds, and later to work ground in benches or below drainage not profitable or possible by the sluice system.

A gold dredge is a flat-bottomed boat, with the forward part of the hull so divided as to form a well in which the ladder and bucket chain may be raised or lowered. Upon the

boat is mounted a digging ladder and chain of buckets; a disintegrating and screening apparatus; a system of sluice and other gold saving devices; pumps, anchoring and moving arrangements; a stacker for the disposal of the coarser gravel, and motors, winches, gearing, etc. The early dredges were small and driven by steam power, but the best ones now use electric power and have been so enlarged and perfected that they have been able to dig gravel from 50 to 80 feet below water level at the rate of from 300,000 to 400,000 cubic yards a month, with an operating cost of from three to six cents per yard. The outlay for such dredges is from \$300,000 to \$500,000. The main dredging fields now are California, Alaska, Colombia, New Zealand and Australia. The output from all dredging operations in the United States, from the start to the end of 1916, amounted to \$120,103,117. In Alaska, sluice dredging, as also drift mining, is impeded and made costly by the necessity of thawing frozen ground by jets of dry steam which is applied through pipes, also called points, driven in the gravel.

Before starting dredging, the ground is prospected by shallow pits or drilled by Keystone drills, a light self-contained machine capable of boring a six-inch hole to moderate depths and of saving samples of the material passing through. In placer mining the most valuable minerals associated with gold are platinum, found chiefly in Russia, Colombia and California, and tin (cassiterite), found principally in Australia. The most abundant mineral association, however, is magnetite (black sand), garnet, zircon (white sand) and monazite (yellow sand).

**Lode, Vein or Quartz Mining.**—The principles and methods of mining lode gold ores apply as well to those of silver, copper, lead, tin and zinc. The first requirement is accurate sampling and assaying, valuation of the deposit and the determination of the scale of working; second, prospecting, including diamond drilling, temporary shafts, winzes and raises; and third, developing and exploiting the deposit underground. This brings in its train the consideration of the size and nature of opening into the mine, whether by tunnel or entry, or incline; rectangular, round or octagonal shafts; also whether cars, skips, cages, kibles or buckets should be used in the hoisting ways. The system of stations involves loading devices, levels, cross-cuts and drifts from the main openings. For exploitation it is necessary to consider the winzes, raises, and advisability of overhand, underhand, long wall, rill or shrinkage stopes; sub-level, top-slicing or other caving systems; and whether the support of the ground should be by pillars, square set timber or stalls, waste rock, cribs of timber and waste and tailings.

In the matter of mechanical equipment, the type of hoisting or winding engines and the probable output and depth of their working has to be taken into account, as also the advisability of the use of steam, electricity, water or gas, as source of power. It is also necessary to consider whether direct steam pumps, rod driven pumps (Cornish), hydraulic, compressed air or electrically driven pumps, are preferable. Bailing by tanks attached to the winding engines is often expedient and in some cases gives excellent results. In underground transportation

or tramping, the problems of the use of man power, compressed-air locomotives, electric-storage locomotives and electrical haulage present themselves. Drilling and explosives are vexed subjects. Hand drilling until recently was the method most in use; now most of the boring is done by air drills, the two main types being, first, the use of the drill as the piston extension, and second, the action of the piston as a hammer striking the head of the drill. The sizes of the piston and weight of the drills are matters of much import. Air compressors are of divers makes and are driven either by steam, water, electric or gas power. Great diversity of opinion exists as to grades of explosives to be used in different deposits. The advisability of the systems are greatly dependent on the nature and class of the deposit and the economic conditions prevalent in the region. These and many other details connected with the technique of mining are more fully treated and explained under mining (q.v.).

**Treatment of Gold Ores.**—The treatment of gold ores depends greatly upon their richness and associations with other minerals, their gangues and rock embeddings and the economic conditions in the district in which the work is performed.

An outline of the ordinary reduction and recovery can best be considered under the following headings: Elimination of waste; conveyance to mill or reduction plant; rock breaking; crushing; amalgamation; concentration; chemical treatment, chlorination, cyanide; treatment of amalgam, zinc precipitates, bullion, refining. The site of a reduction plant is influenced by the topography of the country, the relationship of mine, mill and water supply, also transportation facilities. The ideal situation is when the mine outlet and mill are close together upon a hillside, with slope allowing gravity movement of the ore pulp and tailings. This is rarely obtainable, but excellent results can be obtained on flat ground with suitable machinery.

**Elimination of Waste.**—The elimination of waste before treatment was in early practice largely effected by hand-picking the ore on dressing floors; in more modern practice the coarser ore, after screening, is dumped upon revolving annular tables, or belts, where it is washed and the hand-sorted ore scraped or dumped into bins or rock breakers. In this way often a large per cent of the rock hoisted is not sent to the mill and the grade of the ore treated is correspondingly raised. This policy of sorting is of doubtful benefit when the cost of reduction is small, as there must always be some gold in the waste selected, as also added cost from the sorting. In some mines sorting and packing of waste is done underground.

**Conveyance to Mill or Reduction Plant.**—The mills are often some distance from the mines and made to serve several shafts, outlet adits and tunnels, or a mill may be consolidated with the hoisting appliances of one shaft or tunnel. The mines, on the other hand, may be far from the mill and various methods of transportation, as pack animals, carts, wagons, tram cars, gravity inclines, aerial conveyors, locomotives and electrical haulage, may be resorted to. At some mines a head frame of a shaft, or the dump from a tunnel, and a mill have been joined together so that the mine hoist dumps the ore at such a height that it can be

sorted, the rock and ore broken in rock breakers and the ore run by gravity direct into the mill bins.

**Rock Breaking.**—There are two classes of rock-breaking machines in general use—jaw breakers with reciprocating motion and the gyratory crusher. The breakers are often placed over the mill bins, sometimes in the head frames of the shafts, now more common in plants to themselves, and the broken rock conveyed to the mill bins by cars or conveyors. In the larger size of crushers the rock as dumped from skip, or car, is led to them in chutes. In some installations there are two sizes of crushers so that the ore can be finer crushed before reaching the stamps or other fine crushers. In some mines the primary rock breakers are placed underground.

**Crushing.**—The earliest crushing machine in use in America was the Arrastra, being introduced at the same time as the Patio process, about 1557. It is an apparatus for grinding and mixing ores by means of heavy stones dragged around upon a circular bed paved with stones, and charged with mercury. It was cheaply constructed and worked by animal power; it ground very finely and often gave very high extractions. Except for prospecting, it is almost obsolete, as the output from it is so limited and modern crushing machinery so improved. The stamp battery is the most common form of fine crusher. A stamp is a heavy iron or steel pestle, raised by a cam keyed on a horizontal revolving shaft and let fall by its own weight. They are ranged in line in groups of five, having a mortar box in common. The box is made of heavy cast iron, especially strong and solid at the bottom. The pestle is shod with a removable iron or steel shoe, and the bottom of the mortar clad with iron or steel blocks known as dies. Water and ore are fed into the mortars continuously, the water by pipes and the ore by automatic feeders. The blows of the stamps splash the water and pulp against screens set in the side of the mortar box and the ore after being crushed to the required size thus ejected. The height of drop of the stamp is usually five to seven inches, the number of drops per minute about 90 and the size of screening or perforated plates varying from 40 mesh to the inch to perforations as large as one-quarter inch. The stamps vary in weight from 100 to 2,000 pounds, only the very early stamps were as light as 100, and only South African as heavy as 2,000. The most common weight is between 1,000 and 1,500 pounds, and with crushing capacity between three and five tons to the stamp in 24 hours. The heavy stamps with one-quarter inch screen apertures and supplemented by fine grinding tube mills have crushed 20 tons to the stamp. Crushing rolls, Huntington mills and ball mills have been used to replace the stamp mill and under certain favorable conditions have given excellent results, but as a whole the stamp mill may still be considered the most economical and satisfactory device.

**Amalgamation.**—The pulp or discharge from the mortar, or tube mill, passes over copper plates. These plates are commonly 15 feet by 4 feet 9 inches and given a grade of one and one-quarter inches per foot, sometimes made shorter in two or three sections with slight drops

between. The plates are treated with quicksilver and dressed so that the gold amalgam formed on the plates is made use of to catch more gold, the quicksilver is fed partially into the mortar which is sometimes supplied with inside plates, and also the outside plates are sprinkled with quicksilver, the amount depending upon the amount of gold in the ore. The amalgam on the plates should be neither too hard nor soft. Cleanups of amalgam are made daily, and the amalgam squeezed in cloths or chamois skins so as to eliminate the excess quicksilver. The amalgam is then stored for periodical retorting.

The amount of recovery by amalgamation varies from 90 per cent for very rich free-milling ores to only 30 or 40 per cent for complex ores; the average for the Witwatersrand conglomerates was about 60 per cent. A higher percentage of amalgamation is obtainable by finer grinding and longer contact with mercury, as by the Arrastra and Patio processes employed in South America, and amalgamation pans.

**Concentration.**—The mill pulp after passing over amalgamated plates, or sometimes directly from the battery, is subject to classification and concentration of the small percentage of the coarse and heavier materials which carry much of the remaining gold. The amount of gold so obtained is dependent upon the character and treatment of the ore and varies greatly. In some cases concentration is omitted and the ore directly treated by the cyanide process. In early practice, after amalgamation, concentrates were obtained by the use of rough blankets placed on inclined planes and frequently washed and renewed. The practice of concentration was further developed by the use of convex and concave buddles and the use of large areas of canvas on inclined floors frequently hosed down and cleaned. More perfect concentration is now obtained by the use of Frue and other vanners, on which concentrates are caught and subjected to slow constant longitudinal and slight rapid side-shake movements. Percussion tables, such as the gilt-edge concentrator, with an end bump, were often used; as also Wilfley tables, with riffles and smooth surface, and longitudinal jerking action; and Hartz and other jigs, especially useful for coarse-crushed ore. Hydraulic classifiers are used for obtaining of concentrates as well as for the separation of sands and slimes for cyanide treatment. There are several kinds in use—the Spitzkasten, an inverted pyramid box into which the pulp stream enters at one side and is discharged at the other, and the coarser material drawn off at the apex. The regulation of the settlement is effected by baffles, the angle of sides of the box and the discharge valve at bottom. The Spitzlutte is similar in principle to the Spitzkasten, but with the addition of an ascending current of water at the apex and modification in the dimensions of the pointed box. The cone classifier works on the same principle but with perfected details. The Dorr classifier is in the form of an inclined trough, open at one end, in which mechanically operated rakes are placed to remove the heavy material as fast as it settles, the liquid and slimes overflowing at the closed end.

**Flotation.**—The flotation process is the most modern, new and interesting method of concentration. The Elmore process, in 1897,

demonstrated on a practical scale that by using residuum oil in the crushing of ore, sulphides and metallic particles could be floated on top of a pulp stream, skimmed and treated as concentrates, and the earthy and stone materials kept at the bottom and discharged as tailings. Many improvements and innovations have since been made and the process is being extensively used. The fundamental principles are film suspension, oil buoyancy and bubble levitation. The latter phase depends upon the aid of bubbles of gas which by attaching themselves to particles of minerals buoy them to the surface. For a detailed explanation of the various devices of flotation, special literature should be consulted.

**Chemical treatment, chlorination, cyanide.**—The chlorination process—one of the early attempts at chemical treatment of gold ores—has been extensively used since 1850 for extracting gold from concentrates. It has practically given place to the cyanide process. The Plattner process, originated in Freiberg in 1848, is the best known. It depends on the fact that chlorine readily attacks gold and forms soluble gold chloride, which is precipitated by suitable reagents. It requires that the sulphide concentrates should be subjected to a dead roast in reverberatory furnaces before the chlorine treatment is given; it also requires that the vats have removable tops that may be closed and sealed. Besides the Plattner there are several barrel chlorination processes, the best known being the Thies. In this process chlorine gas is generated inside the barrel by means of bleaching powder and sulphuric acid, and a gas pressure of a few pounds to the square inch maintained.

The cyanide process is based on the facts that dilute cyanide solutions will dissolve the precious metals from their ores when finely crushed, and that when gold in solution is brought in contact with zinc it will be precipitated. It is also possible to separate the gold from the solution electrically by using iron anodes and sheet lead cathodes. The Siemens-Halske process on this principle achieved some success, but is unable as a rule to compete commercially with zinc precipitation. Patents for cyanide extraction were taken out in Great Britain as early as 1840 and in the United States in 1867, but it was not until 1887, through the investigations and experiments of J. S. McArthur and R. W. Forrest, that the cyanide process showed practical results. These investigators demonstrated the benefit of using very weak solutions of cyanide and the precipitation on zinc shavings confined in boxes through which the solution flowed. McArthur and Alfred James, in South Africa, worked out a successful system of economic treatment, which, though since greatly extended and improved in detail, embodied the basic fundamentals. The benefit of fine grinding or crushing was clearly realized by them in the early days, though not so completely applied as later.

The cyanide process has been a great help in the extension of gold and silver mining. On the Witwatersrand it has been especially beneficial in that the gold occurs in such fine particles that extraction of only 55 to 65 per cent could be obtained by amalgamation, with but small addition by concentration and chlorina-

tion. By amalgamation and cyanide treatment, however, about 94 per cent is now obtained. Most gold and silver ores are amenable to cyanide treatment, though antimony combinations are very detrimental and the association with tellurium may require preliminary roasting or very fine grinding. The field of the cyanide process has constantly widened since its introduction in South Africa in 1890, and there have been many developments in its details. The flow sheets of the mills and cyanide works vary in the same as well as different mining districts. The pulp is classified into sands and slimes and separate treatment given to each. For details of the process see works mentioned in references.

**Treatment of Amalgam, Zinc Precipitates, Bullion, Refining.**—The gold in the amalgam is separated by retorting; that is, mercury is vaporized by heat, and condensed in cooled pipes. The gold is left in the form of a yellow sponge which is melted with suitable fluxes in graphite crucibles and poured into bullion molds. Gold bullion contains some silver, copper and other metals, which are separated at mints or private refineries, by sulphuric acid, chlorine gas or electrolytic treatments. See **ELECTROCHEMICAL INDUSTRIES.**

The zinc precipitate is in the form of impure brown powder or filter-press cakes. It is treated in various ways; viz.: (1) By direct fusion with fluxes; (2) roasting followed by fusion; (3) treatment with acid, followed by fusion with or without roasting; (4) reverberatory furnace, lead fusion and cupellation; (5) blast furnace, lead fusion, then cupellation. Both rich gold ores and concentrates, especially when associated with lead or copper, are treated directly in smelters. Considerable gold is also recovered from copper and lead smelting in which gold is a small by-product and incidentally recovered in refining.

**Geographical Distribution of Gold Mining.**—The following table gives the distribution of gold production. It also indicates that the output has reached its zenith during the past five years, and now has a downward tendency. The output for 1917, given at \$423,590,200, is approximately 6.7 per cent less than the output for 1916. The table gives the percentage of production for all countries for 1913, and shows that the territory of the Entente Allies produced 91.3 per cent and that of the Central Powers only 0.6 per cent of the world's gold.

The greatest gold mining district in the world is the Witwatersrand, Transvaal, South Africa. The principal mines are in an area about 30 miles long by 5 miles wide. The ore is in conglomerate beds included in a sandstone and quartzite succession, which though somewhat faulted is so uniform as to permit one mine opening into another. Although the conglomerate deposits were originally of placer origin, the sharp crystalline nature of the gold indicates secondary deposition or reduction. Some shafts are more than 5,000 feet deep. Production in 31 years has been about \$2,500,000,000. The yield per ton has decreased from \$12 in 1890, at cost of \$10.25 per ton, to \$6.40 in 1916, with cost of \$4.50 per ton. The total dividends have been about 24 per cent of the output. The largest force employed has been about 200,000 natives and 26,000 Europeans.

(a) Included in Dutch East Indies.

(b) African production undistributed.

The United States, including Alaska, ranks next to South Africa in production. The output in 1916 was \$92,590,300. Of this about 25 per cent was from placer mining and more than half of which was from dredging operations. Yields and costs vary in different districts.

The greatest producers are mines of low or moderate values in large, massive ore bodies, with favorable conditions for economical working. A conspicuous example is the Homestake Mine in South Dakota, which, since 1875, has produced over \$147,000,000, with a yield under

\$4 per ton, and costs of \$2.50 to \$3 per ton. Dividends of 27 per cent of the output have been paid. The Alaska Treadwell group of mines, on Douglas Island, Alaska, and the Alaska Gold and Alaska Juneau, which are situated opposite, have the record of the world for the lowest lode-mining costs. The Treadwell group treated 25,000,000 tons, yielding \$2.37 per ton, with total costs of \$1.42 per ton. The Alaska Gold in 1916 produced about 2,000,000 tons, with a yield of 97 cents, and operating costs of 73 cents. The Portland, a telluride mine, in Colorado, where working costs are high, has produced \$40,000,000 worth of ore, averaging \$27 per ton, and declared dividends of only 20 per cent. The phenomenally rich ore of the Goldfield Consolidated, Nevada, though producing \$50,000,000, has fallen in seven or eight years from \$38 per ton to \$7.52 per ton in 1916.

The yearly production of gold in the United States, by States, from 1914 to 1917, is as follows:

PRODUCTION OF GOLD IN THE UNITED STATES, BY STATES, 1914 TO 1917, INCLUSIVE.

COUNTRIES	1914	1915	1916	1917	Rank

The richest gold and silver lode in the world was the Comstock Lode, which opened in 1859 and worked extensively for 30 to 35 years, and produced over \$470,000,000, of which about \$190,000,000 was gold. The working costs were very high. Mount Morgan Mine, in Queensland, is a great gold and copper deposit. It was started as a gold mine in 1882 as an open-cut working, in a siliceous gossan capping of a copper sulphide deposit. It is now being largely exploited for copper. It has yielded in dividends about \$43,000,000. Its costs have been high. The Waihi Gold Mine, in New Zealand, started in 1887, is still working, and has yielded over \$30,000,000. It was one of the first mines to successfully use the cyanide treatment. The Mysore mine in India has worked since 1880, has been a big producer for a narrow lode and is still operating with shafts over 4,000 feet deep. The deepest and longest-worked gold mine in the world is the Saint John del Rey, Brazil, worked since 1830,

and which has attained a depth of 5,900 feet, vertically.

From the 4th to the 15th centuries "Chemia," or alchemy, flourished and was busied in the attempt to transmute base metals into gold and silver. The alchemists, though they failed in their main object, laid the foundations for the science of chemistry and improved the metallurgy of the metals. The gold seekers have been instrumental also in the discovery and opening up of lands in new countries and the spreading of knowledge. The gold miner has blazed the trail for civilization in many lands. It has been well said, "Trade follows the flag, it is true, but the flag follows the pick."

#### GOLD ORES. See GOLD MINING.

**GOLD OF PLEASURE**, an annual cruciferous plant (*Camelina sativa*), with abundant yellow flowers, called "cameline" by the French and "dotter" in Germany. It is a weed

in lint-fields, but is also cultivated in parts of Europe for the sake of the oil in its seeds. Its seeds and oil-cake are, however, inferior to those of flax, rape or colza. The stems are used for thatch, and made into brooms; and their fibres are sometimes woven into very coarse cloth and packing-paper. The seeds are used for emollient poultices. *C. dentata* is similar, but is not cultivated.

**GOLD RESERVE.** See BANKS AND BANKING—FEDERAL RESERVE SYSTEM.

**GOLD STANDARD BILL.** See GOLD COINAGE.

**GOLD STANDARD AND GOLD PRODUCTION.** The metal gold is the only substance of which the earth is composed that is freely accepted in return for all services and in exchange for all other kinds of property by every race in the world. In other words, it is the world's standard of value; the one commodity the market for which cannot be glutted; the one substance that is everywhere accepted not only without compulsion and without limit as to quantity, but that is also the particular object of universal desire. As a mineral it has a history that is probably almost as old as the human race that has fought for its possession with so much avidity. No less than 1,400 years before the dawn of the Christian era, the Greeks were using it as an object of ornamentation, and yet even they were not the originators of the practice. They had borrowed the custom of wearing gold to make the person more attractive from the Egyptians, a people that had decked its women in gold more than 1,000 years before the Greeks had dreamed of utilizing it in this manner. It was, of course, the use of gold as an ornament that first suggested its subsequent use as money, and that finally made it the standard upon which the coinage of the world is based.

Among the many things for which the 19th century will always be memorable not the least important will be the fact that it was during this period that the single gold standard was adopted by practically all the civilized nations of the earth. Beginning with a monetary system that, in a broad sense, may be described as the double standard of silver and gold, the nations of the ancient world maintained this method until sometime in the Middle Ages. From about the beginning of the 7th century, however, and until sometime in the 13th century, the single silver standard of coinage prevailed, and, when the double standard was then reintroduced, it remained in vogue until the 19th century, when the progressive financiers began to appreciate the need of a better system.

England was the nation that led the way in the work of exchanging the double standard of silver and gold for the single gold standard, but, while this was done in 1816, other countries were slow to follow in her footsteps. It was not until 1854, therefore, that the double standard was superseded by the single standard in Portugal, but Germany followed in 1871; the United States, in 1873; the Scandinavian States, in 1874; Holland, in 1875; France and the Latin Union, in 1876; Austria-Hungary, in 1892; British India, in 1893; Japan, in 1898 and Russia, in 1899. The gold standard also prevails in Rumania, Serbia, Turkey and Egypt, but, while all the South and Central American

countries, with the exception of Bolivia, Colombia, Guatemala, Honduras, Nicaragua, Salvador and Paraguay have adopted it, most of them are almost hopelessly entangled in a mass of irredeemable paper. It may thus be seen that, among all the nations of importance, China and Mexico alone failed to adopt the single gold standard during the 19th century.

It was not alone for this reason that the 19th century was closely identified with the history of gold, however, for it is this period that will always be noted for having been the occasion of two great events in the world's record; the greatest discovery of gold and the greatest production of gold. According to the statistics prepared by the director of the mint, the world's production of gold during the first half of the 19th century was \$787,463,000, while for the second half it was \$6,909,040,000. At the beginning of the century the most important gold-producing countries were Mexico, Colombia, Peru, Brazil and Argentina, in the western hemisphere, and Russia and Hungary in the eastern hemisphere. With the exception of small quantities that were obtained in Africa and from the East Indies there was practically no other places where the metal could be found. During the period from 1801 to 1810, the average annual yield of these countries was not in excess of \$12,000,000, and fully two-thirds of this amount came from the American mines. Owing to the revolutionary disturbances that broke out in Mexico and throughout South and Central America during the period between 1810 and 1824, the output of gold, as well as that of silver, was greatly reduced. At this time the world's production of gold declined until it reached the comparatively low average of about \$7,600,000 per annum, an amount which, in the opinion of William Jacob, one of the best authorities of that period, was insufficient to supply the quantity used in the arts and to make good the loss by accidents, such as by abrasion, shipwreck, etc. As the restoration of peace was quite generally effected about this time, however, disaster was avoided for the increase in the production of gold, which began at once, steadily continued. Even the average output of Russia commenced to show some remarkable gains, her production between 1837 and 1848 averaging more than \$12,500,000 per annum, which was in excess of the production of the entire world at the beginning of the century. The following table gives the details of the world's production during the first half of the century as computed by the director of the mint:

PERIOD	Annual average	Total for period
1801-1810 .....	\$11,815,000	\$118,152,000
1811-1820 .....	7,606,000	76,063,000
1821-1830 .....	9,448,000	94,479,000
1831-1840 .....	13,484,000	134,841,000
1841-1850 .....	36,393,000	363,928,000
Half-century .....	\$15,749,200	\$787,463,000

The era of gold discovery dates from 1848, when James Wilson Marshall, on 19 January, discovered a small lump of gold in the tail-race of Sutter's sawmill, in El Dorado County, Cal. Naturally such a discovery led to a search, not

only of the bed of the stream but in the adjoining ground, and, in both places, rich deposits of the precious metal were found. The story of the rush that followed this find of new gold fields is a familiar tale to readers of American history. The news spread like wildfire through California, down the Pacific Coast to South America, and finally east to the Atlantic States, and so to Europe. In response to these tidings gold hunters flocked from every inhabitable portion of the globe, with the result that the gold production of California alone amounted to \$36,000,000, or a sum equal to that which the annual average of the entire world had attained during the preceding decade. A year later it had reached the sum of \$56,000,000, and it was in that year that a similar discovery of placer gold was made in New South Wales, which was followed shortly by a still more important find in the colony of Victoria. New mines were also discovered in Russia during this period, and as all these discoveries were attended by great public excitement and heavy immigration the new mines were so well worked that the production of Australia and New Zealand soon aggregated \$65,000,000, while that of Russia alone was in excess of \$25,000,000.

The finding of the Comstock lode in Nevada was the next great discovery of the precious metal. This fissure vein, which was fully four miles long, was in rock of the Tertiary Age, and was situated at the base of Mount Davidson, in the Virginia range, an offshoot of the Sierra Nevada. In the central part of the fissure its width is about 3,000 feet, while the gangue, or veinstone, is quartz, not uniformly distributed in the fissure, but coagulated in large bodies commonly known as "bonanzas." Apparently the metal had been deposited in this place in solution, while some idea of the tremendous magnitude of the deposit may be obtained from the fact that, since 1861, the year when it was first scientifically worked, the Comstock lode has yielded more than \$470,000,000 of bullion. At the value ratio of 1 to 16.40 per cent of the bullion produced was gold, while 60 per cent was silver. As the richest ore bodies of the lode had been exhausted during the seventies, the annual yield gradually declined until, in 1882, it was less than \$1,500,000, but as attention was then turned to the working of such lower-grade ores as had previously been neglected, the annual production gradually increased until it had again attained a figure of several millions.

It was about this time (1884) that there was discovered in the Witwatersrand of the Transvaal a deposit of gold that was destined to surpass in magnitude, not the Comstock alone, but every other find of the precious metal that the world had ever seen. Here the country rock is a bed of sandstone, interlaminated with deposits of conglomerate, known to the Dutch as "banket." It is this conglomerate that carries the gold, the average being 10 pennyweights per ton of material. Borings to the depth of 3,500 feet, however, have found the proportion of gold in this reef undiminished, while the outcroppings of the reef have been traced for a distance of 40 miles. The working of these mines gave the Transvaal a gold production of \$78,070,761, in 1898. Then came the interruptions due to the war with Great Britain, in 1899, and this, with other disturbances, made

a full resumption of the work impossible prior to about 1904, although it was believed that the output of the Rand would yet equal the sum of \$150,000,000. It reached this vast amount in 1908.

The most surprising discovery of modern times, however, was the finding of the gold placers of the Klondike, in 1894. As the ground underneath which this gold is found is perpetually frozen, it is quite evident that these deposits must have been laid down at some age when the climate of that region was much warmer than it is at present. To procure this gold to-day, however, it is necessary to sink a shaft through the frozen ground by the use of hot boulders, after which the drift is run by building a fire against the face of the ground, the gravel which is then thrown out being left until summer, when it will thaw sufficiently to permit of washing and panning. It has been estimated that all the gravel which two men are able to throw out during the eight months of winter can be washed by the same men in two months of the summer. In spite of the difficulties of mining and the cost of transportation the output of the Klondike region steadily increased until 1900, when it was estimated at more than \$20,000,000. Since that time there has been a slight falling off in the product, which, in 1904, was figured as somewhat more than \$16,000,000. Similar placer mines have also been discovered in the Cape Nome region of Alaska, and, in 1904, their output amounted to more than \$9,000,000.

At the present time, however, the most important gold-bearing district within the borders of the United States is that at Cripple Creek, Colo. This ore is a telluride, known to mineralogists as calaverite. The country rock is altered andesite, granite, or phonolite, containing thinly disseminated iron pyrites and tellurium minerals. The tellurium at or near the surface is oxidized and the gold when it is visible exists as an ochre-like powder known as "mustard gold." The tellurium, through a process of roasting, is oxidized, and the gold thus set free in the metallic state is easily soluble by cyanide or chlorination. The estimated yield of the Cripple Creek district in 1904 was \$24,000,000. The increase in the gold production of Australia during recent years has also been a remarkable factor in extending the world's output. During 1900, new workings were established in West Australia, and these, with the product of the older mines, produce an amount of gold, which, in 1904, was approximated at nearly \$88,000,000.

The statistics showing the world's production of gold during the 58 years up to 1908 are as follows:

PERIOD	Annual average	Total of period
1851-1855	\$132,513,000	\$662,566,000
1856-1860	134,083,000	670,415,000
1861-1865	122,989,000	614,944,000
1866-1870	129,614,000	648,071,000
1871-1875	115,577,000	577,883,000
1876-1880	114,586,000	572,391,000
1881-1885	99,116,000	495,582,000
1886-1890	112,895,000	564,474,000
1891-1895	162,947,000	814,736,000
1896-1900	257,596,000	1,287,978,000
1901-1908	—	1,613,098,600
Total	\$138,181,000	\$8,522,138,600

The production of the world by single years from 1905 to 1908, inclusive, was:

Year	Production
1905	\$380,288,700
1906	402,503,000
1907	412,532,900
1908	441,932,200
Total for 4 years	\$1,637,256,800

The world's production of gold in 1908, according to the same authority, was divided as follows:

Countries	Value
Australia	\$73,327,300
Africa	166,520,500
United States	94,560,000
Russia	28,047,600
Canada	9,842,100
Mexico	22,371,200
India	10,598,500
China	8,647,300
All others	28,013,100
Total	\$441,932,200

The production of the United States and its territories during 1909 was divided as follows:

State, etc.	Value
Colorado	\$21,954,700
California	21,271,300
Alaska	20,947,600
Nevada	14,908,600
South Dakota	6,849,900
Utah	3,844,800
Montana	3,599,400
Arizona	2,672,300
Idaho	1,389,300
Oregon	712,900
All others	11,081,600
Total	\$99,232,200

In concluding this review of the gold situation it may be interesting to note the manner in which new supplies of gold operate on prices. From a commercial point of view, gold stands for purchasing power, and yet people do not mark up the prices of their goods merely because some new gold mine has been discovered, but the fact that some men have two dollars in their pocket where they had only one dollar before creates a greater demand for goods, and it is to this increased demand that the advance in prices is due. It was in this way that the new supplies of gold acted when they brought about an increase in both prices and wages during the 20 years succeeding the discovery of the precious metal in California. This result was not brought about because the community was richer for the privilege of having two dollars instead of one with which to transact a given amount of business, but because, as Professor Cairnes shows, the distributions of the earnings of society was shifted by giving the advantage to wage-earners over rentiers and others having a fixed income. The former had more steady employment and better wages than before, while the latter were compelled to pay higher prices for the goods which they consumed without experiencing a corresponding increase in their income.

**GOLD STICK**, superior officers in the English Royal Bodyguard, and captains in the Corps of Gentlemen-at-Arms. They take the name from the gilded batons carried by them on state occasions.

**GOLDAU**, gol'dow, a valley in Switzerland, in the canton of Schwyz, between Mount Rigi and the Rossberg. On 2 Sept. 1806 a land-

slide from Mount Rossberg destroyed the village of Goldau and three other villages situated in the valley, killing about 450 persons. A little village built in the valley, near the mines, is called Goldau. It has a population of about 490.

**GOLDCHAIN, or GOLDEN MOSS.** See **STONE-CROP.**

**GOLDEN, Colo.,** city, county-seat of Jefferson County, on Clear Creek, and on the Union Pacific, the Denver & R. G., and the Colorado Southern and other railroads, about 15 miles west of Denver. In the vicinity are deposits of coal and brick clay. The chief industries are smelting, the manufacturing of brick and pottery, tiles and flour milling. A State Industrial School and a School of Mines are located here. The waterworks are owned by the city. Pop. 2,477.

**GOLDEN AGE,** among the Greeks and Romans was the reign of Saturn, whose blessings are described by Virgil in his eclogue addressed to Pollio. The Latin poet was borrowing from the Greek Hesiod who depicted the Golden Age as the patriarchal era of Saturn or Cronos. This was followed by the Silver Age of voluptuousness under Jupiter. Then came the Brazen or warlike age under Neptune. To this succeeded the Heroic Age under Mars, the Iron or Utilitarian Age under Pluto, god of riches. The Golden Age in England was the reign of Elizabeth (1558-1603); in France under Louis XIV. The Golden Age of German literature included the period between Klopstock and Goethe (1750-1850). The Golden Age of Italian art was the famous "Cinque Cento" extending from the life of Leonardo da Vinci (d. 1520) to Michelangelo (d. 1576).

**GOLDEN ASS, The.** The 'Metamorphoses' of Apuleius, or 'The Golden Ass,' as they are popularly called, are the most famous, if not the best, of the Milesian tales—collections of stories which were intended to tickle the fancy with voluptuous pictures by being related in a brief, witty manner. Such tales enjoyed universal favor in antiquity and were probably the prototypes of the Italian "novelle" and the French "fabliaux." As the opening words of 'The Golden Ass' indicate, the plot was taken from a still extant Greek work, 'Lucius the Ass,' formerly, though probably incorrectly, attributed to Lucian, a contemporary. Apuleius, however, was no mere slavish translator. He improved the plot of the original by shortening several scenes and cleverly paraphrasing others, by embellishing it with other excellent stories of love, sorcery, jests and robbers, and in particular by inserting the long and beautiful allegory of Cupid and Psyche (bk. IV, sect. 28, to bk. VI, sect. 24), which has been described as "an antique gem in an unworthy setting." Probably many of these stories were not original, but belonged to the common stock of Greek and Latin literature. There were quite a few collections of these "facetiae," the most famous of which was called "Milesian Tales," originally collected by one Aristides and translated into Latin in late republican times by the historian Sisenna. Probably some of these survived in the earlier novel of Petronius. Although most of the tales are of more than doubtful morality, Apuleius tells them in such

a rollicking fashion that the spirit of fun predominates, just as in Boccaccio's 'Decameron,' which contain at least two of Apuleius' stories in Italian surroundings. The hero of 'The Golden Ass,' one Lucius, traveled into Thesaly where, after a sojourn of a few days, he was transformed into an ass through his excessive curiosity to learn magic. Nothing could restore him to his own shape but the eating of a rose, which he at length obtained by prayer after many trials and adventures. The book ends with a fine description of the mysteries of Isis, into which the hero is initiated and through which he becomes purified. The theme of the work has been explained as somewhat allegorical: that men overcome by lusts of flesh become practically beasts and are not restored to their pristine selves except by tasting the rose of reason and virtue to be obtained by prayer. Apuleius has been criticized for his rare and outlandish words, his coinages and jingling assonances, his græcisms and solecisms, but it must be admitted that the style which he has adopted is admirably suited to the character of the work. An eclectic critical text by S. Gaselee and a reprint of William Adlington's (1566) translation with improvements appear in the Loeb Classical Library (1915).

HERBERT F. WRIGHT,  
*Sometime of the Department of Latin, The Catholic University of America.*

**GOLDEN BEETLE,** one of the richly gilded beetles of the family *Chrysomelida* (q.v.).

**GOLDEN BIBLE,** the Book of Mormon, which Joseph Smith, Jr., professed to have found in 1823. He declared that an angel appeared to him and led him to the discovery. He was not, however, allowed to take up the gold plates on which the book was written until four years later. Joseph Smith was at first unable to read the "reformed Egyptian" characters in which the revelation was written until, in the same box with the plates, he discovered an instrument called Urim and Thummin, by the aid of which he translated the Golden Bible into English and published it in 1830, with the certificate of 11 men testifying that they had seen the plates of gold. See **BOOK OF MORMON.**

**GOLDEN BOOK (LIBRO D'ORO),** official record of the notables of Venice under the Republic. The roll was inscribed in letters of gold, and the term was afterward used to designate any list of honors. The Golden Book of Venice was destroyed by Napoleon in 1797.

**GOLDEN BULL,** a name given to several state documents; the principal ones are as follows:

1. Of Hungary, 1222, wrung from King Andrew II by his nobles, just as Magna Charta was extorted from John of England. Andrew II of Hungary, surnamed "Hierosolymitanus," was a feeble, self-willed, worthless king, like John of England. Its terms were:

The nobles and the Church were to be exempt from taxes.

The daughter of a noble without male heir shall inherit one-fourth of his property,

No noble shall be obliged to follow the king in any foreign war.

The palatine (that is, mayor of the palace), shall be the supreme judge.

No foreigner to hold office or dignity without consent of the council of the realm.

The king shall not grant counties or offices of any kind in perpetuity.

If the king violates any of the laws in this bull, it shall not be treason to levy war on him.

This bull was so called because the attached seal was enclosed in a golden case or box. It is rather remarkable that one of the very first countries in Europe to effect the liberty of subjects should have been one of the last-born nations, the Huns of Hungary.

2. 'Bulla Aurea of the Empire,' 1356, published by Kaiser Karl IV at the Diet of Nuremberg, and held the Magna Charta of Germany. It prevented a repetition of the contests which had hitherto arisen whenever a vacancy in the throne occurred; and regulated the functions, number and privileges of the electors. Called "golden" because the seal attached to the parchment was of gold instead of lead, or else that it was enclosed in a golden case.

It limited the number of electors to seven (three prelates and four lay princes). The prelates were the three archbishops of Mainz, Cologne and Treves; the lay princes were the king of Bohemia, the Duke of Saxon, the Margraf of Brandenburg, and the Pfalzgraf of the Rhine. Their persons were declared sacred. Every question was to be decided by majority and without appeal.

**GOLDEN CALF**, an idolatrous image, doubtless of Egyptian suggestion and symbolism, cast by Aaron from the earrings of the people, while the Israelites were encamped at the foot of Sinai and Moses was absent on the Mount.

**GOLDEN CIRCLE**, Knights of the. See **KNIGHTS OF THE GOLDEN CIRCLE**.

**GOLDEN CROSS**, United Order of the. See **UNITED ORDER OF THE GOLDEN CROSS**.

**GOLDEN-CROWNED SPARROW**, **THRUSH**, etc., birds so named for some conspicuous yellow marking on the top of the head. The sparrow (*Zonotrichia coronata*) is a near relative of the white-crowned, or Peabody bird (q.v.), and is seen in the United States only in the spring and fall; it sings brilliantly in its Arctic and Alaskan breeding-home. The golden-crowned "thrush" is a warbler, better known as "oven bird" (q.v.). The "wren" or "gold-crest" is a kinglet (q.v.).

**GOLDEN or WAR EAGLE**. See **EAGLE**. **GOLDEN EAGLE**, **ORIOLE**, **POVER**, **SHINER**, **WARBLER**. See **EAGLE**; **ORIOLE**; **POVER**, etc.

**GOLDEN CHAIN**, or **GOLDEN RAIN**, tree of the laburnum family. See **LABURNUM**.

**GOLDEN-EYE**, **WHISTLE-WING** or **RATTLEWING**, a duck (*Clangula clangula*) which breeds numerously in all northern regions where its nest is made in holes in trees, or (in Lapland) in suitable boxes placed in trees. The American birds form a geographical race called *Americana*. During cold weather they appear in the United States and the middle districts of Europe, traveling about in small, watchful parties which escape swiftly on the least alarm, and arouse all other ducks within sound of the loud noise made by their wings. An European

name is "garrot." The general color of the drake is white beneath, with head and sides of neck rich green, back and tail grayish-black and the bill bluish-black; it has a round white spot before each eye, the iris of which is golden yellow, and two white bands on the wing; length about 19 inches. The female is ashy, with rufous head. In the Rocky Mountains and northward occurs a second somewhat larger species, Barrow's golden-eye (*C. islandica*), which differs prominently in the greater extent of the loreal spot.

**GOLDEN FLEECE**. See **ARGONAUTS**.

**GOLDEN FLEECE**, *Capture of the* ('Argonautica'), an epic poem in four cantos, by Apollonius of Rhodes (235 B.C.), a contemporary of Ptolemy Philadelphus. Apollonius found all the elements of his poem in the legendary traditions of the Greeks; the expedition of the Argonauts being, next to the siege of Troy, the most famous event of the heroic ages. The third canto describes the conquest of the Golden Fleece, and the beginning of Medea's love for Jason, the development of which forms the finest portion of the poem. The Argonauts go through the most surprising adventures, and encounter perils of every description, before they are able to reach the port from which they started. These various events have allowed the poet to introduce brilliant mythological pictures, such as his account of the Garden of the Hesperides. The work has been frequently translated, and is admittedly the masterpiece of Alexandrian literature. The 'Argonautica' of Valerius Flaccus is an imitation of that of Apollonius, regarded by most modern scholars as without originality or invention.

**GOLDEN FLEECE**, *Order of*, a celebrated order of knighthood in Austria and Spain, founded by Philip the Good, Duke of Burgundy and the Netherlands, at Bruges, 10 Jan. 1429, on the occasion of his marriage with Isabella, daughter of King John I of Portugal. The order was instituted for the glory of the saints and the protection of the Church, and the fleece was probably assumed for its emblem as much from being the material of the staple manufacture of the Low Countries as from its connection with heroic times. The number of the knights was 31, and they themselves filled up vacancies by vote. This continued till 1559, when Philip II of Spain held the last (the 23d) chapter of the order in the cathedral of Ghent; and subsequently Philip obtained from Gregory XIII permission to nominate the knights himself. After the death of the last Hapsburg king of Spain in 1700, the Emperor Charles VI laid claim to the sole headship of the order in virtue of his possession of the Netherlands, and, taking with him the archives of the order, celebrated its inauguration with great magnificence at Vienna in 1713. Philip V of Spain contested the claim of Charles; and the dispute, several times renewed, was at last tacitly adjusted by the introduction of the order in both countries. The insignia are a golden fleece (a sheepskin with the head and feet attached) hanging from a gold and blue enameled flint-stone emitting flames, and borne in its turn by a ray of fire. On the enameled obverse is inscribed *Pretium laborum non tale*. The decoration was originally suspended from a chain of alternate flints and rays, for which Charles

V allowed a red ribbon to be substituted, and the chain is now worn only by the grand-master. The Spanish decoration differs slightly from the Austrian. The costume consists of a long robe of deep red velvet, lined with white taffetas, and a long mantle of purple velvet lined with white satin, and richly trimmed with embroidery containing fire-stones and steels emitting flames and sparks. On the hem, which is of white satin, is embroidered in gold, *Je l'ay empris* ('I have captured it'). There is also a cap of purple velvet embroidered in gold, with a hood, and the shoes and stockings are red. Consult Reiffenberg, 'Histoire de l'Ordre de Toison d'Or' (1830); and Zoller, 'Der Orden vom Goldenen Vlies' (1879).

**GOLDEN GATE**, a channel at the entrance to San Francisco Bay, between the peninsula upon which is located San Francisco and the one upon which Sausalito stands. The average width is two miles, and the depth is sufficient for ocean steamers. It is guarded by Forts Pointe and Mason, both on the south shore, and by a fort on Alcatraz Island. The name was given to this channel by Drake, about 1578.

**GOLDEN HIND**, The, one of the two vessels in Sir Humphrey Gilbert's colonizing expedition of 1583. Gilbert's own vessel was the *Squirrel*, and he went down with it in a storm. The *Golden Hind*, Capt. Edward Hales, returned to England with the news.

**GOLDEN HORDE**, body of Tatars who overran eastern Europe in the middle of the 13th century and founded in Russia the Empire of the Golden Horde, or, Western Kipchaks. Their leader was Bātū-Khan, son of Jūji Khan and grandson of Jenghiz Khan, and the invasion, which began about 1237, was characterized by merciless slaughter and destruction. The Golden Horde conquered and burned everything in their path through Russia and into Silesia, Poland and Hungary. At Liegnitz they defeated Henry II, Duke of Silesia, on 9 April 1241, but the cost of this victory was so heavy that Bātū-Khan found himself unable to conquer Neustadt, and turning back upon his path established himself on the Volga, his gorgeous tent giving rise to the name of the empire and its followers, the Golden Horde. Here he summoned the Russian princes to render fealty, and rapidly established a power which remained unbroken in the hands of his direct descendants until 1359, when the empire was ruled under various heads of the old house of Jūji, none of them governing the entire empire. In 1378, however, Toktāmish of the Eastern Kipchaks established himself as emperor of both Eastern and Western Kipchaks, and for a time maintained something of the old glory of the Golden Horde, but was finally overcome by Timur in 1395. Consult Howorth, Sir H., 'History of the Mongols' (1876-85); Lane-Poole, S., 'Mohammedan Dynasties' (1894).

**GOLDEN HORN**, the harbor of Constantinople, an inlet of the Bosphorus; so called from its shape and beauty. See CONSTANTINOPLE.

**GOLDEN HOUSE OF NERO**, a palace which Nero erected for himself at Rome after the disastrous fire of 64 A.D. This palace stretched from the Palatine across the level

area on which the Flavian amphitheatre was afterward built to the foot of the Esquiline. According to Tacitus, whose virulence is often unjust, Italy and the provinces were plundered to gratify the emperor's love of magnificence in the erection of this structure. Gold and precious stones blazed on its walls; the grounds around it were variegated with meadows, lakes and shady woods, and it was considered one of the wonders of the Roman Empire.

**GOLDEN HUMMER** (BLACK-EARED FAIRY), Peruvian humming bird (*Heliothrix aurita*). It has a sheen of gold over its plumage which is green and heliotrope above and white below, with golden shading at the throat.

**GOLDEN LEGEND**, collection of legendary lives of saints, written by Jacobus de Voragine, archbishop of Genoa. The work was entitled 'Legenda Sanctorum' by the author but was popularly christened 'Legenda Aurea' or 'Golden Legend' because of its estimated worth. It was called 'Lombardica Historia' in some early editions, due to the fact that a short history of the Lombards down to 1250 is added to the life of Pope Pelagius which forms next to the last chapter in the book. The work contains 177 chapters, or, by some estimates, 183, and is divided into five parts, from Advent to Christmas, to Septuagesima, to Easter, to the Octave of Pentecost, to Advent, and gives the lives of the saints in the order of their festivals. The book was written with devotional rather than historical purpose and was not only widely popular in its day but exercised considerable influence on the religious prose and poetry of later times. In 1500 it had run through 74 editions in Latin, besides three translations into English, five French, eight Italian, 14 Low German and three Bohemian. The first English edition was printed by William Caxton for the Earl of Arundel (1483), which edition was revised by Ellis (New York and London 1900). The best Latin edition is that of Grasse (Dresden and Leipzig 1846, 1850; Breslau 1890); the first French edition was that of Jean Batallier (Lyons 1476), and recent French editions are those of Brunil (1843, 1908) and Roze (1902). The author, James of Viraggio, or Jacobus, or Jacopo de Voragine, was born at Viraggio (now Varazze), near Genoa about 1230 and died 13 July 1298. He entered the Order of Saint Dominic, was provincial of Lombardy in 1267-86 and held other high offices in the Church until 1292, when he became archbishop of Genoa.

**GOLDEN LEGEND**, The, lyric drama by Longfellow, one of the trilogy entitled 'Christus,' published in 1851. It has a mediæval setting and is of a religious character. While some critics find in it a suggestion of 'Faust,' others ascribe its title and conception as coming from the 'Golden Legend' of Jacobus de Voragine. It is also thought to be based on Hartman von Aue's 'Der Arme Heinrich.'

**GOLDEN MOLE**, or **CAPE MOLE**, a South African insectivore with fur showing golden iridescence. It has the habits of a mole, no external ears or tail and the eyes covered with skin; but a greater structural resemblance to the potamogales (q.v.). Five species consti-

tute the family *Chrysochloridæ*, differing from moles (q.v.) most markedly in the fact that the forefeet are adapted for digging by the development of the middle toe into a powerful tool, and by a hollowing inward of the chest. The best-known species is *Chrysochloris trevelyani*, about six inches long.

**GOLDEN NUMBERS**, Cycle of, Metonic lunar cycle, a period of 19 solar months, or 235 lunations, after which time the new moon falls again on the same days as in the preceding cycle. The discovery was made by Meton, the Athenian astronomer, 423 a.c., who divided the calendar into periods of 19 years, numbering from 1 to 19, in which the new moons would come on the same days in the years designated by the same numbers. The Athenians welcomed the system and it was ordered that the years of the Metonic cycle should be written in gold on marble pillars in the temple, hence the name, Golden Numbers. The 19 years of the Metonic cycle were purely lunar, which obviously made it impossible that all the years should be of the same length, a difficulty overcome by assigning to 12 of the 19 years 12 lunations, while the remaining seven had 13. The 13th lunation was designated as the embolismic or intercalary month. The Metonic reckoning by the Gregorian calendar is from 1 a.c., as by the Metonic system the new moon beginning the cycle fell on 1 January every 19th year. As in the Julian calendar the months had no reference to the moon, the early Christians used the Metonic lunar cycle to fix the date for Easter. The cycle was used as originally devised by Meton until 1582, when it was revised and incorporated as a part of the Gregorian calendar.

**GOLDEN ORIOLE**, commonly known as the Baltimore oriole, an American bird (*Icterus galbula*), closely allied to the *Ploceidæ*, weaving birds of Asia. Its nest is skillfully constructed so as to hang in the form of a long slender pouch from the extremity of a bough. Its plumage is brilliantly contrasted in color, and as black and yellow were the armorial colors of Lord Baltimore it was named in early colonial days after that nobleman. It is found in the hot months as far north as the coast of New Brunswick, and westward from the Saskatchewan River to Texas and northern Louisiana. In winter it migrates to Panama and the West Indian Islands. It is a powerful and delightful songster. Its eggs are from four to six in number and hatch in 14 days. The golden oriole is the farmer's friend and destroys many insect pests which are destructive to vegetation.

**GOLDEN ROSE**, a rose of gold, or gilded, blessed by the Pope on the fourth Sunday of Lent and sent to some sovereign or other person who is known for his or her loyalty to the Holy See. It is sometimes sent to noted churches or sanctuaries.

**GOLDEN RULE**, the rule laid down by Jesus in the Sermon on the Mount and stated by him to be the law and the prophets—that is, a summary of their teaching: "Therefore all things whatsoever ye would that men should do to you, do ye even so to them" (Matt. vii. 12). This rule had already been "examined and adopted as a standard of ethics by westerners like Socrates and easterners like Theng-

tsen, the disciple and friend of Confucius, some centuries before the birth of Christ."

**GOLDEN SEAL**, Order of the, fraternal organization incorporated in New York State in 1902. Membership includes life insurance, as well as covering losses through accident and illness. It is organized with a mutual sharing of profits clause, dividends being declared every six years. It is governed from a supreme court and distributes about \$1,000,000 in benefits annually. Membership (1918) 10,000.

**GOLDEN SEAL, ORANGE-ROOT, YELLOW PUCCON, or YELLOW INDIAN PAINT**, a ranunculaceous perennial plant (*Hydrastis canadensis*) of wooded regions throughout the eastern United States, which sends up in early spring a hairy stem about a foot high, with large, deeply-lobed leaves and a single greenish-white flower, followed by a head of crimson berries which resemble a raspberry. The root-stock is gathered by country people, especially in the South, for the sake of its thick orange-yellow bark from which a drastic and tonic medicine is made.

**GOLDEN SECTION** (SECTIO AUREA), division of a line in extreme and mean ratio, solved by Euclid II, and originally known as "divine proportion." The Pythagoreans used it in the construction of the regular pentagon, and Eudoxus perfected various theorems relating to it. Fra Luca Pacioli treated the subject at some length in 'Divina Proportione' (Venice 1509; German translation, Vienna 1889); and his ideas were embodied in Zeising's 'Neue Lehre von den Proportionen des menschlichen Körpers' (Leipzig 1854) and 'Der goldene Schnitt' (1884). Consult Bochenek, 'Kanon aller menschlichen Gestalten und der Viere' (1885); Pfeifer, 'Der goldene Schnitt' (1885); Mathias, 'Die Regel von goldenen Schnitt im Kunstgewerbe' (1886).

**GOLDEN SPUR**, Order of the, a papal order of knighthood, whose foundation has a legendary origin in Constantine the Great, or Pope Sylvester. Its institution can be traced historically to Pope Paul IV, 1559. The title of the members is "Count Hospitalers of the Lateran." The right of bestowing the order is vested in other prelates and kings beside the Pope. When it languished, Gregory XVI revived it in 1841. It is intended to be bestowed as a recognition of conspicuous merit in personal character, science and art, and for services done to humanity and the Holy See. The badge is a gold Maltese cross with white enamelled surface, to which a pendant spur is attached. On one face of the cross is a bust of Sylvester, with the inscription, *Sanctus Sylvester Pont. Max.* (Saint Sylvester, Pope). On the reverse is engraved "MDCCCXLI Gregorius XVI. restituit" (Gregory XVI restored it in 1841). The order has three grades; the ribbon is red with black stripes.

**GOLDEN STATE**, California, so named on account of its gold deposits.

**GOLDEN TREASURY**, The, a collection of English poetry published in 1861. The book was dedicated to Tennyson, with whom Palgrave had long discussed his plan. In the course of 30 years the original form was en-

larged to include other poems of importance and rearranged to conform more to literary history, the latter change in some judgments advantageous, in others not. The collection begins with the Elizabethans, and, with some rather conspicuous omissions, the old English ballads or some of Shelley, for example, and the relative exaggeration of the amount of Wordsworth included, follows the great names up through Keats, Shelley and Byron. The great success of the book can scarcely be said to have diminished to this day. The 'Second Series,' composed of contemporary verse, appeared in 1897, but was comparatively a failure. Palgrave's age and the uncertainties of contemporary judgment, perhaps, afford the explanation. Anthologies, collections of the flowers of poetry, are of ancient origin; but few—none in English certainly—have rivalled 'The Golden Treasury.' Palgrave's original poetry never attained to great eminence, but the quality that he gave to his anthology amounts to a unique and original distinction. It is as if a finely endowed artistic nature had worked, though unable to create through the brush itself, to bring together a collection of pictures that expressed a veritable artistic creation. The author—a word that applies thus to no other anthology-maker in English—of 'The Golden Treasury' expresses himself through taste and judgment in poems as another author might in subject matter and style. And not the least of the causes to his complete effect lies in the subtle and exquisite arrangement by which poems follow one after another, leading out the thought of one to enrich the other, and often to build up a mood to which each poem is made to contribute and by which it is revealed. The combination of the last five poems in the book, for example, is itself a poem; and the idea of ending the whole with Shelley's "Music when soft voices die" is an act of creative imagination.

STARK YOUNG.

**GOLDEN VERSES**, collection of maxims credited to the Pythagoreans, containing in brief sententious form the teachings of every-day virtue.

**GOLDEN WARBLER**, American wood warbler (*Dendroica aestiva*), also called yellow bird, summer warbler and yellow warbler. Their predominating color is a yellowish olive-green, the female being slightly darker than the male. They are common to North America in general, migrating southward to Central America and the upper portion of South America. They are closely allied to the golden-winged warblers (*Vermivora chrysophtera*), one of the swamp warblers with similar migratory habits.

**GOLDEN WASP**, or **GOLD WASP**, a cuckoo-fly (q.v.).

**GOLDEN WEDDING**. See **DIAMOND WEDDING**.

**GOLDEN-WINGED WOODPECKER**. See **WOODPECKER**.

**GOLDENROD** (*Solidago*), a genus of plants belonging to the family *Asteraceæ*, containing about 125 species, most of them natives of North America, where their brilliant yellow flowers are very conspicuous in the autumnal months, especially in Canada and the northeastern United States. Two or three species are

found in Europe, and a few in South America and Mexico. They are perennial, herbaceous, with simple undivided leaves and bear numerous small heads of flowers, disposed in spikes or panicles. Among the marked forms of inflorescence are the pyramidal panicle of numerous, one-sided, scorpioid racemes, well illustrated by *S. canadensis* and *S. rugosa*; the almost level cyme of *S. rigida*; and the dense thyrus-like cluster of *S. speciosa*. The florets of the ray are about five in number, and yellow, *S. bicolor* excepted, which has whitish rays. The dried leaves of the sweet-scented or anise-scented goldenrod (*S. odora*) have been used as a substitute for tea. This plant yields an aromatic oil with tonic properties. In Europe the different species are cultivated in gardens for ornament; one, the Aaron's rod (*S. virgaurea*), is common in Great Britain. The alpine goldenrod is found on the summits of mountains in Maine, New Hampshire and northern New York. The sea-side or salt-marsh goldenrod (*S. sempervirens*) is an especially showy species; and the "yellow-weed" (*S. canadensis*) sometimes attains a height of eight feet.

**GOLER, George W.**, American physician: b. Brooklyn, 24 Aug. 1864. He took his M.D. at the University of Buffalo in 1889. He was connected with the Infants' Hospital, Charlotte, N. Y., in 1888-97; medical inspector of the Rochester Board of Health in 1892-96; and since 1896 he has been health officer of Rochester. He established in 1897 a series of municipal milk depots which have been recognized as models and adopted by health authorities in Europe and America. He established the Rochester Hospital for Infectious Diseases in 1904, and since its opening has acted as attending physician. He has been active in the crusade against tuberculosis; was honorary president of the 4th section of the International Congress for Child Hygiene at Berlin 1911; and is a member of the advisory committee of the National Consumers' League. He is author of a number of articles on hygiene and sanitary science.

**GOLDFINCH**. (1) The familiar North American black-winged "yellowbirds" or "wild canaries" of the genus *Spinus*, the best known of which is the Eastern thistle-bird or lettuce-bird (*S. tristis*), whose wave-like flight across the fields, each male singing sweetly in its course, forms one of the most pleasing incidents of a rural stroll. These little finches are bright golden-yellow, with the cap, wings and tail black in the adult male; while the female and immature young are gray-brown and yellowish; and in autumn the male discards his conspicuous dress and assumes the plain attire of his mate. At this season they collect in flocks and remain together during the winter, seeking the seeds of the meadow-grasses and roadside weeds, especially thistles, and often coming near the house and barn. Their summer food includes more soft material, and they gather many caterpillars for their young. The goldfinch is one of the latest birds to make its nest, delaying until midsummer to fabricate the soft cup of hempen and downy materials which is lodged usually in some crotch of a village shade-tree, and contains half a dozen spotted bluish eggs. Several other species dwell in the

western United States and southward. (2) The small European finch (*Carduelis carduelis*) to which the name first belonged, and whose habits are much the same as those above described, but which is more varied in plumage. The bill is horn-color, the tip black and the base encircled with crimson; nape of neck white; top of head, shoulder of wing and a part of the quills, black; remainder of wing dull yellow; back and rump dusky brown; under surface dull white. Its nest is neatly built of moss, twigs, roots, etc., lined with wool, is situated in bushes, hedges or apple-trees, and the eggs are spotted with purple and brown. This finch is one of the sweetest singers of Europe, a favorite cage-bird and the one most often taught pretty tricks; it is the most useful decoy in bird-catching. Examples are to be found in bird-stores all over the world; and in the neighborhood of New York many have escaped and are living wild in the parks and environs.

**GOLDFISH**, a carp (*Carassius auratus*), highly cultivated long ago in China as a domestic fish for the sake of its rich red-gold color, developed out of an originally much duller hue. It was introduced into England in 1728 and has spread over all of Europe and is naturalized in many waters of the United States as well as everywhere kept in household aquaria. The young are dark-colored, assuming the golden hue later in life, and sometimes losing it in old age, when the fish becomes silvery. The "silver fish" is a mere variety, as are the so-called "telescope fish" with large protruding eyes and the Japanese "butterfly fish," in which anal and caudal fins become more or less markedly double. All of these varieties thrive well in confinement when furnished with favorable conditions in the aquarium (q.v.), but are liable to fungus diseases of the skin. Diseased fish will infect all in an aquarium, and the aquarium itself, so that in the case of an inexpensive glass globe it is better to throw the receptacle away; a large aquarium should be emptied and thoroughly treated with some fungicide (q.v.) before new and healthy fish are installed. These fish are bred for sale by some fish culturists in various parts of the United States, who must exercise care or their stock will revert toward the original unadorned type of the species.

**GOLDIE**, Sir George Dashwood Vauham, British administrator: b. The Nunnery, Isle of Man, 20 May 1846. He was educated at the Royal Military Academy, Woolwich, and entered the Royal Engineers with rank of lieutenant, remaining there for two years. He then engaged in traveling and exploring in Africa and in 1877 reached the Niger country. Realizing the possibilities of development in the country of the lower and middle Niger he set about adding those regions to the British Empire. He chose the Dutch East India Company for his model, secured the consolidation of British commercial interests in the Niger under the title United African Interests in 1879, and in 1881 appealed to the government for a charter. For five years Goldie fought opposition of various sorts and met them with achievements that overruled them. The name of the company was changed to the National African Company, its capital increased from \$625,000 to \$5,000,000, and numerous new stations were established on

the Niger. Treaties, drawn by Goldie, were made with some 400 lower Niger and Hausa states, French territorial rights were bought in 1884 and at the Berlin Conference in 1885 he was able to establish the fact that the lower Niger territory was wholly under the British flag. The Niger coast line was also placed under British protection. In July 1886, Goldie's efforts were rewarded by the granting of the desired government charter, the company then becoming the Royal Niger Company. Lord Aberdare was appointed governor and Goldie vice-governor, and in 1895 he became governor. In 1900 the Royal Niger Company ceded its territories to the British government in consideration of a payment of \$4,325,000, it having become impracticable for a chartered company longer to maintain its rights against the state-protected interests of France and Germany. Goldie was knighted in 1887 and received honorary degrees from Oxford and Cambridge. He served as a member of the Royal Commission on the South African War in 1902-03, and on that of the War Stores in 1905-06. He is a member of the Royal Society, was president of the Royal Geographical Society in 1905, became a privy councillor in 1898 and is president of the National Defense Association.

**GOLDING**, Arthur, English writer and translator: b. probably at London about 1536; d. about 1605. He finished the translation of Philippe de Mornay's treatise 'Sur la Vérité du Christianisme' which was begun by Sir Philip Sidney and entrusted to his care, publishing it under the title 'A Woorke Concerning the Trewenesse of the Christian Religion, etc.' (1589). Beside making translations of the works of Calvin and Beza, he also translated the first four books of Ovid's 'Metamorphoses' (1567).

**GOLDMAN**, Emma, Russian agitator and anarchist: b. Kovno Province, Russia, 1869. She emigrated to the United States in 1886 and joined the anarchists in their protests at the executions following the Haymarket Square riot in Chicago soon after her arrival. She gained great notoriety by her speeches in German and Yiddish, denouncing established order. In 1893 she was sentenced to a year's imprisonment at Blackwell's Island, New York City, for speeches and actions inciting to riot. She lectured extensively in England, Scotland and the United States, and after 1906 was connected with *Mother Earth*, an anarchist organ. She was a delegate to the Anarchist congress in Paris, 1899, and at Amsterdam in 1907. In 1917 she was tried for conspiracy against the Draft Law and on 10 July 1917 was sentenced to two years' imprisonment and fined \$10,000. An appeal was granted by Justice Brandeis of the United States Supreme Court on 20 July and she was released on bond. The United States Supreme Court affirmed the sentence 45 Jan. 1918 and on 12 Feb. 1918 she began her sentence at the Federal prison, Jefferson City, Mo. Under the alien law existing at the time, an alien twice convicted of a crime may be deported; so that conviction carried with it a sentence of deportation. She wrote 'Anarchism and Other Essays' (1910); 'The Social Significance of the Modern Drama' (1914), etc.

**GOLDMARK, Karl**, Austrian composer: b. Keszthely, Hungary, 18 May 1830; d. 1915. He studied at the Vienna Conservatory. His first composition of note was the overture, 'Sakuntala' (1858); his first opera the 'Queen of Sheba' given at Vienna in 1875. His other works include 'Merlin,' an opera performed for the first time at the Metropolitan Opera House, New York, in 1887; the overtures 'Prometheus,' 'In Spring' and 'Penthesilea'; and the symphony 'The Country Wedding.'

**GOLDMARK, Reuben**, American composer: b. New York, 15 Aug. 1872. He was educated at the College of the City of New York and at the Vienna Conservatory of Music. He was a pupil of Door and Rafael Joseffy on the piano and of Fuchs and Antonin Dvorak in composition. He was instructor in piano and theory at the National Conservatory of Music, New York, in 1891-93 and director of the Colorado Conservatory of Music in 1895-1901. He returned to New York in 1902, has given extended courses of lecture recitals in United States and Canada and produced a number of compositions. In 1910 he received the Paderewski prize for chamber music. Among other compositions are a symphonic poem, 'Samson,' and the overture to 'Hiawatha,' played by the Boston Symphony Orchestra.

**GOLDONI, gòl-dò'nè, Carlo**, the founder of modern Italian comedy of comedies: b. Venice, 1707; d. Paris, 6 Feb. 1793. He early showed a taste for theatrical representations, reading every dramatic production of which he could obtain possession, especially the works of the popular comic poet, Cicognini, and when scarcely eight sketched a comedy, which excited the wonder of his relatives. His father, a physician then practising at Chiozza, destined him for the medical profession, and took him occasionally to visit his patients. But Goldoni, dissatisfied with this study, obtained permission to study law in Venice. Soon after, however, a relative procured for him a place in the Papal College at the University of Pavia, from which he was expelled for writing an abusive satire. His father died in 1731, and from this time Goldoni lived an unsettled and wandering life, resorting to various means to make a livelihood, but usually living as the companion of strolling players in a continual scene of dissipation and intrigue until 1736, when he married and removed to Venice.

Goldoni's merits in reforming the Italian theatre cannot be mistaken. He was a most prolific writer, and in one year produced an output of 16 comedies. Many of his numerous pieces still retain possession of the stage in his native country, and, in translations, of the stages of foreign countries. Among the numerous editions of his works, that published at Venice in 1788 and 1794-95, in 44 volumes, is the most complete; and that published at Florence in 53 volumes in 1827 the most elegant. Translations and imitations of some of his works have been made in French, German and English. Goldoni wrote memoirs of himself in French, in which he also composed two comedies, one of which, 'Le Bourru bienfaisant,' was produced at Fontainebleau and Paris in 1771 with great applause, and has maintained itself on the stage. (See MÉMOIRES DE CARLO

GOLDONI; UN CURIOSO ACCIDENTE). Consult Memoirs of Carlo Goldoni,' translated by Black, with essay by W. D. Howells (1877); Rahany, 'Le Théâtre et la Vie en Italie au XVIIIème siècle' (1896); Copping, 'Alfieri and Goldoni'; Chatfield-Taylor, 'Goldoni: a Biography' (1913).

**GOLDSBORO, N. C.**, city, county-seat of Wayne County, on the Neuse River, the Atlantic and Norfolk Southern, the Southern and the Atlantic Coast Line railroads, about 80 miles north of Wilmington and 50 miles southeast of Raleigh. It is the site of a State Normal School for colored teachers, the Eastern Insane Asylum, and the Odd Fellows' Orphanage. The chief manufactures are cotton, agricultural implements, cotton-seed oil, furniture, mattresses, veneer, bricks, knitting and machinery. It was settled in 1838 and was incorporated in 1841. The government is administered by a mayor, elected biennially, and a council. The waterworks are municipally owned. Pop. 10,500.

**GOLDSBORO, KINSTON, and GOLDSBORO BRIDGE, Engagements at.** On 11 Dec. 1862, General Foster, in command of the Department of North Carolina, set out from Newbern for the purpose of taking Goldsboro and breaking the railroad that connected Richmond with the railway system of the South and Southwest, and then forming a junction with the Union forces at Suffolk and Norfolk, Va. He had four brigades of infantry, a regiment of cavalry and seven batteries and two sections of batteries, in all about 11,500 men and 40 guns. He reached Southwest Creek on the 13th, to find the bridge destroyed and his passage disputed by about 400 Confederates, with three guns. The 9th New Jersey and 85th Pennsylvania soon routed this force, capturing one gun, and Foster pushed on toward Kinston, skirmishing heavily on the way, and when within a mile of the place, 14 December, encountered a force of 2,000 men under General Evans, posted between the Neuse River and a deep swamp. After a sharp fight Evans was driven across the river, firing the bridge behind him; but the fire was extinguished and 400 prisoners and six guns were taken. Evans retreated through Kinston, reformed his command two miles beyond and withdrew toward Goldsboro. Foster followed, had a successful engagement on the 16th, at White Hall and, when nearing Goldsboro 17 December, was checked by a heavy force under Gen. G. W. Smith at Goldsboro Bridge. Foster succeeded, however, in destroying the bridge of the Weldon and Wilmington Railroad over the Neuse, also several other bridges, and about six miles of railway, and retreated somewhat rapidly to Newbern, having lost, during his eight days' campaign, 92 killed, 487 wounded and 12 missing. The Confederate loss was 71 killed, 268 wounded, and 496 prisoners. The latter were paroled.

After the capture of Wilmington by General Schofield, 22 Feb. 1865, his next objective point and final destination was Goldsboro, where it had been arranged that he should unite forces with General Sherman, who was marching north from Savannah. Forces were assembled at Newbern, and the march began on 1 March. Kinston was occupied 14 March, after some days' sharp fighting. The railway

and bridges were repaired, and Scofield entered Goldsboro with little opposition on the 21st, and two days later Sherman joined him. Consult Official Records, Vol. XVIII; Cox, 'The March to the Sea'.

**GOLDSBOROUGH, Louis Malesherbes**, American naval officer: b. Washington, D. C., 18 Feb. 1805; d. there, 20 Feb. 1887. In 1827 he rescued the English brig *Comet* from a Greek pirate. Retiring from the navy in 1833 he settled in Florida, and there he recruited a company of cavalry which fought under his command in the Seminole War on the conclusion of which he returned to the navy; became commander in 1841; was officer of the frigate *Ohio* during the Mexican War and was present at the bombardment of Vera Cruz. On his return to the United States he was appointed a member of the Joint Army and Navy Commission in California and Oregon (1849). He was superintendent of the United States Naval Academy at Annapolis (1853-57), on retiring from which he again took up active military duties. On the outbreak of the Civil War he became flag officer and rear-admiral (1862). In 1861 he was put in command of the North Atlantic blockading squadron and the advice given by him at this time resulted in the Burnside expedition and the capture of Roanoke Island with various other positions of strategic importance in North Carolina. He was in command of the European squadron (1865-67); commandant of the navy yards at Mare Island and at Washington (1867-73).

**GOLDSCHMIDT, Jenny Lind**. See LIND, JENNY.

**GOLDSCHMIDT, göld'shmit, Meier Aaron**, Danish novelist and publicist: b. Vordingborg, 26 Oct. 1819; d. Copenhagen, 15 Aug. 1887. He entered journalism when quite young, edited the comic paper *Corsaren* (1840-46), and in 1847 founded a monthly publication in which he discussed the political movement of the time, and showed himself a strong advocate of constitutional freedom. His first novel, 'A Jew,' appeared in 1845; other novels of his are 'Homeless' (1853); 'The Heir' (1865); and 'The Raven' (1867); he also wrote a few dramas, and his autobiography (1877). His novels are most remarkable for the skill with which he pictures the life of the Jews.

**GOLDSCHMIDT, Otto**, English composer: b. Hamburg, Germany, 21 Aug. 1829; d. London, 24 Feb. 1907. He was a pupil of Mendelssohn and Hauptmann at the Leipzig Conservatory, became a resident of England in 1858, was appointed a professor in the Royal Academy of Music in 1863 and was its vice-principal (1866-68). From 1876-85 he was first musical director of the Bach Choir. He several times conducted the famous Lower Rhine festivals at Düsseldorf. His compositions include the oratorio 'Ruth' (1867), and he also edited with Sterndale Bennett 'The Chorale Book for England.' In 1852 he married Jenny Lind (q.v.).

**GOLDSCHMIDT PROCESS**, method of reducing metallic compounds by aluminum, perfected by Dr. Hans Goldschmidt of Essen, Germany, which overcomes the difficulties hitherto involved through the extremely high tempera-

ture necessary to secure the reaction and the explosive violence attendant upon it.

**GOLDSMID, Sir Francis H.** (1808-78), the first Jew to become an English barrister (1858), entered Parliament in 1860, representing Reading until his death. A generous contributor to charities, especially University College, London. He was active in the liberal movement and shared the reputation of members of his family in Parliament and English life. Of these may be mentioned his father, Sir Isaac Lyon Goldsmid (1778-1850), chiefly known for his benefactions to education and his efforts in behalf of Jewish emancipation and the passage of the Jews' Disability Bill. Sir Julian Goldsmid, nephew of Sir Francis (1838-96), was many years in Parliament and an influential figure by reason of his ability and wealth. Sir Frederic J. Goldsmid (1818-1908) retired as major-general in 1875, after serving in the China War, in the Crimea and in Egypt. He was distinguished, too, in exploration and surveying. The Goldsmid family sprang from Aaron Goldsmid (d. 1787), a Dutch merchant who settled in England about 1763. His two sons, Benjamin (c. 1753-1808) and Abraham (c. 1756-1810), were noted for their public and private benefactions. They wielded great influence in the money market as bill-brokers during the Napoleonic War.

**GOLDSMITH, Oliver**, Irish poet and miscellaneous writer: b. Ireland,\* 10 Nov. 1728; d. at 2 Brick Court, Middle Temple, London, 4 April 1774. Goldsmith, like Richardson, "flowered late." The son of a poor clergyman of the Established Church, his childhood was spent at Lissoy, a hamlet in Westmeath, lying to the right of the road from Ballymahon to Athlone. From the first instruction of a female relative, he passed to the care of the village schoolmaster, a roving old soldier who had fought in Queen Anne's wars. Thence he went to schools at Elphin, at Athlone, at Edgeworthstown, earning nowhere any particular distinction. He was regarded as dull and heavy intellectually, although physically he was robust and athletic. Now and then he surprised his family by an unexpected gift of repartee, and he scribbled verse early. But nothing occurred in his boyhood to favor the supposition that a genius had been born into the world of letters.

In June 1744 after anticipating, in his own person, the plot of his later comedy of 'She Stoops to Conquer,' by mistaking the house of a gentleman at Ardagh for an inn, his father, impoverished by the attempt to portion his eldest daughter, sent him to Trinity College, Dublin, as a poor scholar. His college career was not brilliant. His tutor was hard and unsympathetic, and devoted to the mathematics which Goldsmith (like Gray and Swift) detested, though he had some faculty for "turning an ode of Horace." He got a small exhibition in 1747, a success which he unwisely celebrated by a mixed party in the garret which passed for his "rooms." Into this rejoicing his incensed tutor burst abruptly, and by knocking down the host, dispersed the guests. Thereupon his humiliated pupil ran away, vaguely bound for

\*The exact place of Goldsmith's birth is doubtful. It is usually said to be Pallas in Longford, but others make it Elphin, Roscommon.

America. Matters were, however, patched up by his elder brother, and he returned to college, where, in February 1749, he took a low degree.

He left no memories behind him but his name scratched upon a window-pane, a battered lexicon scored with "promises to pay," and the tradition that, after writing songs at five shillings a head for the Dublin ballad singers, he used to steal out in the twilight to hear them sung. When he returned to his widowed mother (his father had died during his college days), he had no more pressing vocation than to fish in the river Inny, blow the German flute and take the chair at the village "free and easy." When he was old enough, he presented himself for ordination, but was rejected for incompetence, aggravated by red breeches. He next tried tutoring; made a little money, bought a good horse and started again for America. In brief space he returned on a miserable hack, and without a penny. Law was then essayed. Being equipped with £50 for study in London, he lost it on the road to a sharper. Finally he did reach Edinburgh, to study physic. Upon the same pretext he went from Edinburgh to Leyden. Then, being again without means, he started—like Holberg—to make a kind of Grand Tour on foot through Europe. He visited France, Germany, Switzerland and Italy, flute-playing and disputing at convents for a subsistence. In February 1756, being then 27, he landed at Dover with a few halfpence in his pocket. He had, however, sent home to his brother from Switzerland a fragment of the poem which afterward became 'The Traveller.'

For the moment literature seems to have been the last thing in his thoughts. He is suspected to have tried strolling; he is known to have been an apothecary's assistant, a poor physician (with a dubious foreign diploma), a reader and corrector of the press to Richardson the novelist, and an usher in a Peckham "academy." Here, at last, he drifted into authorship, being engaged by Griffiths of the *Monthly Review* to supply "copy" of all work for that serial. With Griffiths he speedily fell out; and eventually found his way back to Peckham, where his old employer promised to get him a foreign medical appointment. Meanwhile he published (1758), under a pseudonym, a translation of the 'Mémoires' of Jean Marteilhe of Bergerac, a Protestant condemned to the galleys for his religion. Failing, for unknown reasons, to take up the post at Coromandel which had been found for him, he tried to pass as a hospital mate. He was rejected at Surgeons' Hall in December 1758 as "not qualified."

We next hear of him as living in a tiny court off the Old Bailey, writing a high-titled 'Enquiry into the State of Polite Learning in Europe.' This, superficial of necessity, but bright and epigrammatic, attracted some notice. He began a miscellany called *The Bee*, and was employed on various periodicals. Then Smollett enlisted him for the *British Magazine*; and for Newberry's *Public Ledger* he wrote the delightful essays afterward collected in 1762 as the 'Citizen of the World.' By this time the skies were opening. He had moved into better rooms at 6 Wine Office Court, Fleet street, made the acquaintance of Johnson, and

was certain of employment. Besides dispersed papers, he wrote 'Mémoires of Voltaire,' a 'History of Mecklenburgh,' a 'Life of Richard Nash' (of Bath). What is more, he was writing the 'Vicar of Wakefield,' for in October 1762 he sold a third share in that book to Benjamin Collins, a Salisbury printer, for £21. How this is to be reconciled with Boswell's story that Johnson sold the entire novel to a bookseller for £60 has not yet been explained; but internal evidence shows clearly that parts of the book were written in 1762.

His further career must be rapidly abridged. After much compiling for Newberry, which included an excellent 'History of England' in letters, he published, in December 1764, his first long poem, 'The Traveller; or, a Prospect of Society.' Its sweetness of versification, its simple language and the beauty of its descriptions at once distinguished it as the best poem since the death of Pope. Its popularity drew attention to its writer's other work, and a volume of his collected essays followed in 1765. Upon these came 'The Vicar of Wakefield,' 1766. Its success, strange to say, was only gradual, but it continues to this day; and its inimitable types, its happy mingling of Christianity and character, its wholesome benevolence and practical wisdom are not likely to be forgotten. The Primrose family are citizens of the world.

Goldsmith's next triumph was on the stage. In January 1768 he managed, after many vexations, to get a play produced at Covent Garden. This was 'The Good Natur'd Man,' in which he attempted to combat the insipid "genteel" comedy made popular by French models and the novels of Richardson. His efforts were only partially successful, though his profits were sufficient to enable him to move into fresh chambers in the Temple, whence, in a maze of miscellaneous "book-building," he sent forth, in May 1770, another and a still more beautiful descriptive poem, 'The Deserted Village.' It was received with enthusiasm, and speedily ran through three editions. Three years later, though always hampered with task-work, he crowned his achievements with the comedy of 'She Stoops to Conquer.' In the interval which had elapsed since 'The Good Natur'd Man,' "genteel" comedy had passed into the "sentimental" stage. But Goldsmith's bustling piece, skilful in construction and brimming with humor and character, gave a knock-down blow to the lachrymose drama, which was eventually dispatched by Sheridan. A few months later, in April 1774, Goldsmith died, and was buried in the Temple burying-ground. The Literary Club, to which he had belonged, erected a tablet to him in Westminster Abbey, with a well-known epitaph by Johnson. 'Retaliation' and the 'Haunch of Venison,' two of the happiest of his lighter poetical efforts, were published posthumously.

Goldsmith had many weaknesses. He had few physical advantages; and he was both sensitive and self-conscious. But he had the best heart in the world. "Let not his frailties be remembered," said his rugged old mentor, Johnson; "he was a very great man." He was also a very great writer. To have died at 46, after 30 years of purposeless "eddying round and round," the author of two admirable

didactic poems, an unique novel and a comedy which still holds the boards, to say nothing of his essays and familiar verse, which are models in their way, is certainly to deserve a high position in the work of his century—a position which he retains to-day in virtue of his simplicity, his kindness, his humor and the indefinable gift of genius. See *SHE STOOPS TO CONQUER*; *VICAR OF WAKEFIELD*; *DESERTED VILLAGE, THE*; *TRAVELLER, THE*.

**Bibliography.**—Goldsmith's life has been written by Prior (1837); Forster (1848-71); Washington Irving (1844-49); William Black, 'English Men of Letters' (1878); and Austin Dobson, 'Great Writers' (1888; revised American ed., 1899). His "miscellaneous works" were first published in four volumes (1801), with the so-called 'Percy Memoir.' Then, in 1820, came a "trade edition," followed by Prior (1837), and Cunningham (1854-55). The fullest modern edition is that of Gibbs in 'Bohn's Standard Library' (5 vols., 1885-86). There are editions of the poem by Mitford 'Aldine series' (1831-95); Bolton Corney (1845), and in the 'Temple Library' (1889). A reprint of Martineau's 'Memoirs' was published in 1895, and a fac-simile reprint of the first edition of the 'Vicar of Wakefield' with a bibliography in 1885. Consult also Boswell's 'Johnson'; and the Wakefield edition in 12 volumes (1900); Thackeray's 'English Humorists,' and *Edinburgh Review*, 1846 by Lord Lytton.

AUSTIN DOBSON,

*Author of 'Life of Goldsmith,' etc.*

**GOLDSMITH BEETLE.** An attractive northern dung-beetle (family *Scarabaeidae*) measuring nearly an inch in length and shining like burnished gold. It is most abundant during May and June, flying principally at night; and, although it feeds on the foliage of various shade and fruit trees, seldom does much harm. The name is extended by entomologists to all scarabs of the sub-family *Rutelinae*.

**GOLDSMITH MAID**, famous bay trotting mare, sired by Abdallah. She held the world one-mile trotting record in 1871-74, taking it from Dexter in 2:17 and losing it to Rarus in 2:13½. She lowered the record to 2:14 before losing it. Her racing career lasted from 1866 to 1878.

**GOLDSMITHING.** Strictly, the art of working in gold. More broadly, the term is used to include the working in the precious metals (gold, silver, platinum, etc.). In a still broader sense, the jeweler is often termed a goldsmith although his product consists largely of pieces of personal adornment in which stones (precious, semi-precious and otherwise) are the main features and the setting (frequently of other than the precious metals) is often a matter of minor importance. The subject as here treated refers to the manipulation of gold for ornamental purposes. (See also *SILVERWARE*). The chief decorative processes used by the goldsmith are: Repoussé or driven work, pierced work, chasing, carving, filigree, enamel work in cloisonné and champlevé styles, niello, etc. Enamel work (except as a subsidiary feature) is done chiefly on or in copper and has been treated elsewhere. (See *ENAMELS*). On account of the high cost of

gold the process of *casting* is little used as it leaves too thick a relief. See *REPOUSSÉ*.

**Technology.**—Treated in simple language, the following is the general method of the artist-goldsmith (as differentiated from the modern factory technique): The work is started with a piece of well-annealed sheet metal. This is reduced by hammering, or rolling between steel rollers, to the desired thickness. It is now beaten out with hammers and punches into form and decoration—relief and intaglio (*creux*). Chasing, chiseling and finishing follow. The product of the metal worker has been classified as "flat-ware" and "hollow-ware"; the treatment for flat-ware (plates, dishes, saucers, spoons, etc.) is simply one of hammering and punching, etc., the embossed work from the under or negative side, then turning the piece (*blank*) over and working the depressions from the positive side. In hollow-ware (bottles, ewers, etc.), where access to the interior is very limited, the difficulty is overcome by the use of arms (*swages*) projecting from the anvil or bench and which enter the interior of the vessel. The "snarling iron" is one of the most useful of these. The ends of these stakes have different forms at the extremities and afford an inner resisting medium on which the hammer can operate externally to create embossed ornament. For the intaglio or depressed work the vessel is filled with a substance (usually pitch) easily melted yet sufficiently hard, when cold, to afford just enough resistance to the blows of hammer and punch. When the work is finished the substance is melted and poured out. The number of tools formerly used by the artist-goldsmith were more or less numerous, but were fashioned by the individual worker according to his desires. The fact that nomadic tribes, even to the present day, such as Arabs, Csechs, Tziganes, etc., are able to produce on their wanderings very artistic, if not large, pieces of goldsmiths' work proves that a heavy "kit" is not so much the requirement as an extended knowledge (handed down from one generation of the family to the next) of the possibilities inherent in each implement. An anvil, vise, drawplate (for wire), dividers, calipers, hammers with different shaped "panes" (or "peens") and "fices," punches with various faces, scorpers (for lowering the surface by removal), set of engraving tools, swages, soldering irons, blow-pipe, etc., are a few of the necessary tools of a practising goldsmith; but the modern factory outfit adds: draw-bench, turning lathe, polishing lathe, planishing tools, sets of shears, "sparrow hawk," numerous pliers, nippers, treblets, frame-saws, corn-tongs, gauges, micrometer, drill-stock, etc.

**History.**—The art of working gold, though in crude manner, dates back to prehistoric times. The ancient Egyptian goldsmith did cloisonné work with inlays of colored stones and pieces of glass paste. To them we owe the delicate chain-link termed "trichinopoly." Their minute granulated work was done 3,000 years earlier than that of the Etruscans; their pretty gold necklaces with numerous drops were in such common use that the word necklace (*nuib*) was symbol and term for gold. Gold bead anklets were worn between 8,000 and 5,000 B.C. Their astonishingly artistic gold pectoral

ornaments, pierced, carved and inlaid with colored stones, prove the high state of their goldsmiths in art and execution. The ancient Hebrews derived their knowledge of the art from their enslavement in Egypt and from Phœnicia. They made golden earrings, finger-rings, bracelets, chains; the noted seven-branched candlestick and altar vessels of Solomon's temple and the king's table service were of gold. The Greeks in the 8th and 7th centuries B.C. established colonies from Marseilles to the Crimea and their goldsmiths' work followed in their trade routes. The Scythians had wealth and loved golden ornaments and Greek pieces were plentiful with them, as is attested by the frequent discoveries of gold ornaments in the graves. The Etruscan gold jewelry of beautiful design and such extraordinary delicacy with its minute filigree and granulation is ever a cause of wonder to this day. Even the conceited spirit of the great Cellini, when asked to make a duplicate of a piece of this antique

itation of antique Grecian pieces; also we find long arm spirals and arm rings, neck-rings, diadems, large vessels, even axe-heads of massive gold of Celtic origin. The ancient Romans do not appear to have been great gold artificers as the Greeks produced all their rich pieces for their palaces, galleries, etc.

Byzantine goldsmiths' work consists largely of doublets, stones cut *en cabochon*, gem plaques, set in relief and enriched with a groundwork of filigree or sprays of Byzantine acanthus. Examples of this are the golden throne of Theophilus, the crown of Charlemagne. (See CROWNS). Cloisonné enameling came in vogue in this time and persons wore many jewels and trinkets. The "pala d'oro" of Venice was a 10th century product of the Byzantine goldsmiths. Gaul saw a renaissance of goldsmithing in the 5th century and enamel work is claimed by some ancients to have originated in Gaul. They produced torques, bracelets and all kinds of warriors' trinkets with

Etienne De Launay's Goldsmith's Shop.

ware, declared that Etruscan jewelry was impossible of imitation. The Greek sculptors in the days of their greatest fame used goldwork to adorn their ivory statuary (*chryselephantine*); even the great Phidias was a goldsmith. Mys was noted for his gold acanthus carving, also Theokles, Canachus, Smilis, Athenocles. Acragas, Theodoros of Samos were noted among the ancient Greeks for their creations of golden figures, masks and carved plant life. They placed an embossed gold-piece in the bottom of their patera (*emblemata*), they used gold ornament on their furniture, even made furniture entirely of the precious metal. At a festival in honor of Alexander 1,000 guests had a change of gold plates and cups at each course. From the Tène period (5th to 1st century B.C.) we find sword-hilts and large bronze brooches (*fibula*) decorated with gold by the old northern nations, also Celtic gold coins consisting of thin "dish" (concavo-convex) decorations, known as "bracteates," made in im-

simple plait and carved decoration. All we possess of the Merovingian period is arms and fibulae. In the 6th century we hear of Bishop Abbo, Saint Eloi, his pupil, the abbot Thilo of Solignac monastery in the 7th century, all had their goldworking schools. In the 11th century, Bernard, bishop of Hildesheim, had a school of goldsmithing, and he himself executed fine work, specimens of which still exist in that city. The treasure of Guarrazar (see CROWNS) is evidence of the clever workmanship done by the Visigoths of the 7th century. In Italy the Lombards did lovely work and the gold antependium made for Basle Cathedral (now in Cluny Museum), dating late 10th or early 11th century, was one of their best works. Jewelry, bookcovers, crosses, etc., still extant are from their workshops. The Romanesque period is characterized by architectural forms, the reliquary chests (*chasses*) are miniature roofed edifices with gables and arcades containing figures of saints, etc. Fili-

gree and simple geometrical decoration are the groundwork for stone plaques and cabochons. The Saint Remigius chalice of Rheims is a noted example of this period, all of which work is ecclesiastical.

The Gothic period arrived with the 13th century and goldsmithing became work of the laity as well as of the monastery. Guilds were formed to protect the artisan and raise the level of his art. Examples of the 13th to 15th centuries are rare. The reliquary of Nivelles belongs to the 13th century. Noted workers were Jean de Montreux, Claux de Friburg, Henri the miniaturist, Hannequin-Duvuvier, goldsmith to the king in the 14th century, Giovanni di Piza, who with his brothers worked in the cathedral at Arezzo. All Europe, by the 14th century, was fired by Italy's wonderful work. Ognabene of Pistoia had made the great cathedral altar; Cione was decorating the altar of Saint John at Florence. Flemish artists began to exert their influence and we have the names of Jehan Barbier, Jehan Fernicle, Hans Croist, etc. In the 15th century we have the luxurious dukes of Burgundy collecting the rarest objects from the goldsmiths' workshops. The collection left by Louis, Duke of Anjou, had 796 articles of solid plate. The cities were making presentation of plate to the kings, the princes were making presents to other courts. Ecclesiastical reliquary caskets (*chasses*) had become veritable Gothic edifices with windows, trellised crests, pinnacles, clock-towers. The "nefs" of the laity were great examples of hammered work. We find the names of such noted goldsmiths in France as Dufour, Guillaume, Boey, Jean de Clichy; in Italy worked the great artists, Pollajuolo, Verrocchio, Francia Antelotto Braccialforte, Maso Finiguera, Andrea Arditi, Tommaso Ghirlandajo, besides Lorenzo Ghiberti who founded an entire school. Luca della Robbia, the goldsmith, was taking up sculpture. It was the Italian Renaissance in its zenith. In Germany were noted goldsmiths, Hans Greiff (Nürnberg), Heinrich Hufnagel (Augsburg).

In the 16th century France came under the influence of the Italian Renaissance; Benvenuto Cellini went to Paris in 1537 and started a school of goldsmithing. Cellini had made a great reputation in Florence with his superlative art in gold. Ever in trouble from his temper he was glad to expatriate himself for a season. The French love of luxury and the beautiful developed in a wonderful degree. And it was during one of his visits to Paris that Cellini is said to have produced the celebrated 'Nymph of Fontainebleau.' But an edict was sent forth forbidding the use of gold in table services. It soon fell into desuetude. Beautiful models emanated from Delaune and Woerio, designs in pewter from Briot and grand executive talent is shown by such goldsmiths as Desjardins, Ramel, Delahais, Margot. Germany showed her Renaissance tendency in the works of Wentzel Jamnitzer, Peter Vischer, etc., though her Gothic traditions retain some influence in their work. The peculiar Teutonic temperament is disclosed in her bulbous hanaps and pineapple (Ananas) cups. The spreading of the design engravings of

Holbein the Younger, Dürer, Solis, etc., helped the art propaganda, and the 16th and 17th centuries produced works from Flemish and Dutch experts such as de Bry, Collaert and the two Vianens of Utrecht. The early 17th century saw the brothers Mosberaux working in the Louvre, and other artists in gold such as Carteron, de la Barbe, de Roberdet; Ambrogio Foppa (Caradossa) was gaining fame in Milan, and Mignot at Augsburg. Under Louis XIV, later in the century, Lebrun's master mind was getting grand effects from the Gobelins, and gold decorative work came from the hands of de Villiers, Loir, Lepautie, Ballin, Delaunay. But the "grande Fonte" (lasting six months in 1688 and 1689) swept all the fine pieces of goldsmithery in France into the melting-pot for war funds. With the entering 18th century we see the grandiose and pompous style of "le Roi Soleil" taking on a tenuous and delicate form from the designs of Bérain; Briceau carried the idea into goldsmithing. Regency gold decorative art in France produced large objects in gold but sparingly for it was forbidden. Julien Delafontaine did fine jewelry. The style in general was to suppress all excess in gold decoration, yet beauty of effect was produced. The goldsmithing work of Louis XV ran to fantastic decoration such as had become the fashion of all the arts. Some restraint is found in the *rococo* and *rocaille* scrolls and vegetable motifs of Juste-Aurèle Meissonnier and goldsmith Pierre Germain. Roettiers showed talented work. This was the snuff-box collectors' period, and the goldsmiths were equal to their patron's desire for a renewal every week to his stock of *tabatières* of luxurious decoration. Fine gold decoration was displayed on milady's fans, *bonbonnières*, scissors; the dandy's watches, cane-heads, swordhilts, etc. Under all the Louis's French taste ruled over all Europe; Paul Lamerie, the French goldsmith, at the English capital set the style for that court from his workshop. The work of the goldsmith under Louis XVI was sober to severe in decoration; Auguste and Chéret display the style à la vogue. In the return to the antique for form and decoration during the empire period lies its true characteristic. Notable goldsmiths were Odiot, Thomire, Biennais, Fauconnier, the Fannières, Froment-Meurice, Christoffe.

**Modern Goldsmithing.**—The art of the goldsmith has changed to the industry of goldworking—the factory has taken the place of the creator's shop. Paris shows pretty and artistic handwork from a Lalique and other true artists, but the rue de la Paix show windows contain chiefly gold ornament turned out by the die from a stamping machine. Under A. Castellani of Rome industrial jewelry has been produced in late years in remarkably close likeness to antique Greek, Etruscan and Roman examples, and the output has been shipped to the masses of every nation at remarkably low prices in great quantities. England has its jewelry factories in Sheffield and Birmingham; Germany's goldworking factories are located at Pforzheim, Hanau, Schwabisch-Gmünd, Berlin, etc. The United States has goldworking industries on a large scale in the Oranges, Newark, the Attleboros and Providence. But individual pieces made by hand in exquisite taste are not going to become extinct while

London has its Bridges or New York its Tiffany.

CLEMENT W. COUMBE.

**GOLDTHREAD**, a low, smooth ranunculaceous herb (*Coptis trifolia*), closely related to hellebore, whose evergreen leaves are all basal, long-petioled and divided into three serrate broadly ovate leaflets; and the flowers small and white on scapes. The root consists of long, bright yellow, bitter threads. This plant contains a white alkaloid called coptine, and a tea made of it is tonic. It grows in boggy woods throughout northern North America. See also *Coptis*.

**GOLDTIT**. See *VERDIN*.

**GOLDZIHNER**, gölt'se-är, Ignaz, Hungarian Orientalist: b. in Stuhlweissenburg, Hungary, 22 June 1850. Privat-docent at University of Budapest in 1872, he was commissioned by the government to take a scientific journey through Syria, Palestine and Egypt, spending some time at the Azhar mosque in Cairo, where he attended lectures on theology and law. Since his promotion to professorship (1894), he has been an exact and untiring writer in Orientalia, Arabic and Hebrew topics in particular. His contributions to learned societies and congresses have been numerous; he gained the large gold medal at the Oriental congress in Stockholm (1889). In 1890 he became lecturer

on religion and philosophy at the Budapest rabbinical seminary. While he has won special eminence for his researches in the field of Arabic traditions and the history of the civil and religious law of Islam, he has written many important works on Oriental history and the science of religion. His 'Mythos bei den Hebräern und Seine Geschichtliche Entwicklung' was translated into English by R. Martineau (London 1877). Some of his theories have met much opposition but his erudition is unchallenged.

**GOLETTA**, gö-lét-tä, Africa, the port of the city of Tunis, from which it is 11 miles north. In the new quarter are the bey's palace, a large dock and an arsenal defended by a battery. Pop. about 3,000.

**GOLF**, anciently known as *GOFF*, *GOUFF* or *GOVFF*, a game of Dutch origin, but generally identified with Scotland, where as early as 1457 the local Parliament inveighed against its abuse. The Edinburgh town council in 1592 forbade the playing of the game on the Sabbath and offenders were severely punished. The game was played for the first time in England after the accession of James I, whose Scottish train played the game on Blackheath. For over two centuries, however, the game did not become popular in England. In Scotland it had spread throughout the land and many societies and clubs were formed for the practice and promotion of the game, of which the chief was the Royal and Ancient Golf Club of Saint Andrews, established in 1754, and now the national club of Scotland. About the middle of the 19th century the game spread to India, Canada and the United States. The central authority in the United States is the United States Golf Association, organized in 1894 with four clubs. It now consists of about 200 clubs; and there are about 750,000 golfers in the United States. The word, derived from the German *Kolbe*, in Dutch *Kolf*, signifies a club. *Kolf*, resembling golf, is a very ancient pastime in Holland and Belgium, where it is usually played on the ice.

The modern game of golf is played with clubs and balls on specially prepared courses called *links*, generally laid out on open suitable grounds. The simplicity of the game is attractive to beginners, but with a little experience the beginner learns how necessary are practice, skill and judgment to make one play well enough to be classed as a good golf player. The prime necessity is plenty of room. The ground best suited for the purpose is a reach of undulating country with a sandy soil, short, crisp turf and plenty of holes or ruts, the latter forming the *hazards*—natural obstacles—or *bunkers*—artificial obstacles—necessary to prevent the game from being too easy. The *links* should not be less than three miles round nor more than five. Throughout it are distributed 18 artificial holes at any distance from 100 to 500 yards apart. The holes are four and one-half inches in diameter, and each is surrounded with a *putting green*, a space 60 feet square and made as smooth as possible to enable the player to aim with accuracy. The other requisites are two small balls about two inches in diameter and made of gutta-percha, and a number of *clubs* adapted to the various contingencies likely to arise.

There are two styles of clubs, the wood and

the iron; these consist of a long wooden handle, preferably of hickory, securely attached to a head of beech wood, or of steel as the case may be. Altogether there are 19 shapes of clubs, but six are usually sufficient for a player's needs. The different clubs are used under different circumstances; for example, the chief wooden-headed clubs are the *driver* and the *brassy*, the first being used for driving the ball a long distance, and the latter, which is shod with brass, being employed in special situations, as when the ball is in a hollow. The club called the *putter*, used when the ball is near the hole, has the head either of wood or of iron. The iron-headed clubs are the *cleek*, the *iron*, the *mashie* and the *nickie*, all adapted for special purposes. The clubs are used for driving the balls into the holes, and the object of the player is to get his ball into all the holes successively with the fewest possible strokes. When played by two persons the game is called *singles*; when played by four persons in pairs, it is called *foursomes*. There are two chief methods of playing the game, known as *match play* and *medal play*. In the former, two players are usually pitted against each other. Attended by their *caddies*, boys carrying the bags containing the clubs, the players start from the *teeing ground* where one of them begins the match by placing his ball on a small heap of sand, or on an artificial rubber cone, known as a *tee*, and driving it as near as possible to the first hole. A good driving stroke from a tee would be 200 yards. The record, made at Saint Andrews, Scotland, is 280 yards. The other player does the same with his ball, after which the player whose ball is farthest from the hole plays again. They continue thus until both balls have been holed. The player who takes the fewest strokes to do this is said to win the hole and counts one, and if both have taken the same number of strokes the hole is halved and neither counts. Having *holed* his ball the player takes it out, *tees* it again and starts out for the next hole. Much of the interest of the game depends on the skillful play required to avoid the *hazards* and *bunkers*, scattered over the course, or to get one's ball out when it lands in a difficult spot. In *medal play* the winner is the player who goes the round of the course in the fewest possible strokes irrespective of whether he had a majority of holes or not. Various modifications of these two modes of scoring are in use. A hole match may be won before the round is completed, as, for instance, when one competitor is four holes ahead with only three still to be played. When one player has a lead equal to the number of holes still unplayed, he is said to be *dormy* that number of holes, thus, a player when *dormy three* has a lead of three after playing the fourth last hole, in which case, though he may not win, he cannot lose. The central authority on the game in America regulating the various championships, etc., is the United States Golf Association organized 22 Dec. 1894, with which is now affiliated over 200 clubs throughout the country. Consult Beldan, G. W., 'Great Golfers' (London 1907); Braid, James, 'Advanced Golf' (Philadelphia 1908); Clark, 'Golf: A Royal and Ancient Game' (New York 1899); Haultain, Arnold, 'The Mystery of Golf' (2d ed., New York 1910); Hutchinson, H. G., 'The New Book of Golf' (ib. 1912); id., 'Golf Greens

and Green Keeping' (London 1906); Hilton and Smith, 'The Ancient and Royal Game of Golf' (London 1912); Lee, 'Golf in America' (New York 1895); Taylor, 'Origines Golfiance' (Woodstock, Vt., 1912); Travers, Jerome D., 'The Travers Golf Book' (New York 1913); Travis, 'Practical Golf' (1901); Tulloch, W. W., 'Life of Tom Morris, with glimpses of St. Andrews and its Golfing Celebrities' (London 1907); Vardon, 'Complete Golf' (New York 1905).

**GOLGI**, Camillo, Italian neurologist: b. Coriengo, 1843. He studied at the University of Pavia, and engaged in the practice of medicine at Abbiategrasso. He was appointed to a professorship at Siena, and afterward at Pavia. He specialized in the study of nerve tissues and made a vastly important contribution to physiology when, in 1885, he demonstrated the fact that the nervous system is not a network. A further achievement was his identification of a class of nerve endings in tendons which were named in his honor, "organs of Golgi." He is the discoverer of three malarial parasites. In 1906 the Nobel prize for medicine was divided between him and Cajal. He has contributed extensively to the Italian medical journals, the Italian medical encyclopædia, and his collected writings were published in three volumes. (1903.)

**GOLGOTHA** or **CALVARY**, Jerusalem, from Hebrew and Latin *calvaria*, signifying "the place of a skull," the site of Christ's crucifixion A.D. 29. The traditional site as discovered and determined by Bishop Macarius in 325 at the request of Emperor Constantine, is now enclosed among the buildings of the Church of the Holy Sepulchre. See **CALVARY**; **HOLY SEPULCHRE**, THE.

**GOLIAD**, TEX., city, county-seat of Goliad County, on the San Antonio River and the Southern Pacific Railroad, about 45 miles from the Gulf and 168 miles southwest of Galveston. There are interesting ruins of the ancient Spanish mission, a courthouse and a public library. The city contains several cotton gins and is the centre of a cotton growing and stock raising district. Goliad gets its name from Hidalgo (q.v.), the patriot priest of Dolores, who in 1810 led the revolution in Mexico against Spain. When Goliad was founded the people did not dare to name it Hidalgo, so dropping the silent H and transposing the letters, they made the word Goliad. This place was the last site of the ancient mission of La Bahía del Espíritu Santo (1749). This mission was first founded at the place where La Salle built Fort Saint Louis in 1685. Goliad was the scene of a bloody contest (1812) between the so-called "Republican Army of the North," under Magee and Gutierrez, and the Mexicans. Here Magee died, evidently assassinated. In the Texas revolution (1835) Goliad was a point of strategical importance to the Texans. It was captured by Ben Milam and Collingsworth and became the base of military operations. The independence of Texas was declared here 20 Dec. 1835. Ira Ingram and Philip Dimmit were the leaders in formulating this declaration, and at the meeting there were 92 soldiers and all the citizens of the town. The official declaration of independence was made at Old Washington, 2 March 1836. In Goliad, on Palm Sunday, 27 March

1836, the Mexican commander, Urrea, caused to be slaughtered 300 unarmed men who had surrendered, Fannin (q.v.) and his command. These defenseless men had been promised life and liberty before being marched out in squads and shot down like dogs. Urrea claimed he acted under orders from Santa Anna (q.v.). Afterward a rallying cry of the Texas troops under Sam Houston was "Remember Goliad." In 1902 Goliad was visited by a disastrous cyclone which swept away almost the whole town. Pop. 2,250.

**GOLIARDERY**, gō'lī-ār'dēr-l, the name given to the *Carmina Burana*, a series of satirical Latin poems of the 13th century. They were the productions of the self-styled Goliardi, mediaeval wandering students, disciples of the mythical Goliath. While attacking the abuses and vices of the period, especially those existing in the Church, they glorified also the love of nature, women and wine. This naturally antagonized the ecclesiastical mind which was prone to exaggerate into grave sins what ordinary men would consider as mere peccadilloes. From a classical standpoint the majority of the songs are generally below criticism; from a moral point of view, many of them are vigorous and healthful, and are popular among German students of the present day. Consult Schmeller, '*Carmina Burana*' (1894); Symonds, '*Wine, Women and Song*' (1884).

**GOLIATH**, gō-lī'ath, a giant of the Philistines, slain by David. In the war between Saul and the Philistines, Goliath of Gath came forward daily to challenge the champions of Saul's warriors to single combat. The youthful David, armed with a sling and pebbles, answered the challenge, and overcame the giant. The Philistines were routed and the victory was won. The story is told in Samuel xvii. In another place (2 Sam. xxi, 18-22), the vanquishing of Goliath is ascribed to Elhanan, one of the greatest of Saul's warriors. As this tradition is earlier than the David legend, it is probable that the transference of the glory of the victory from Elhanan to David was due firstly to a confusion in names, since Elhanan was the son of Dodo; or secondly, that it was resorted to as a means of explaining David's rapid rise in the favor of Saul.

**GOLIATH BEETLE**, one of the huge scarabe beetles of the cetonian genus *Goliathus*, distinguished by their large size, the horny processes on the head of the male, and the teeth-bearing lower-jaws. The name specifically belongs to *G. giganteus* of the Gold Coast, which is four inches long, and is chalky-white, broadly and variously marked with black. It feeds almost entirely on the sap of trees. Compare HERCULES BEETLE.

**GOLITZIN**, gō-lit'sēn', PRINCE Boris Borisovich, Russian physicist and academician: b. 1862; d. Peterhof, 17 May 1916. He graduated at Naval Cadet Corps 1880; entered Strassburg University 1887; was lecturer at Moscow University 1892; assistant professor of physical science at Yuriev University, Dorpat, and assistant of the Academy of Sciences 1893. From 1899 to 1905 he was manager of the government printing office; president of the Seismological Association 1911.

**GOLLANZ**, Israel, English scholar: b. London, 1864. He was educated at University

College, London, and at Christ's College, Cambridge. He was Quain English student and lecturer at University College in 1892-95; university lecturer in English, Cambridge, 1896-1906; and since has been University professor of English language and literature at King's College, London. He is a Fellow of the British Academy and has acted as its secretary since its foundation in 1903; and was honorary secretary of the Shakespeare Tercentenary Committee. Author and editor of '*Pearl*' (1891); '*Exeter Book of Early Saxon Poetry*' (1895); '*Temple Shakespeare*' (1894-96); '*Hamlet in Iceland*' (1898); general editor '*The Temple Classics*'; '*The King's Library*'; '*The Book of Homage to Shakespeare*' (1916), etc.

**GOLOMYNKA**, or OIL-FISH, a goby-like fish (*Comephorus baikalensis*) found only in Lake Baikal, about a foot long, destitute of scales, and very soft, its whole substance abounding in oil, which is obtained from it by pressure. It is never eaten.

**GOLODRINKA**, green house swallow (*Tachycineta leucorrhoa*) of South America, similar to the white-bellied tree swallow (*Tachycineta bicolor*) of North America. Originally it nested in hollow trees but with the coming of man it nests beneath the eaves of buildings. It is white breasted with green above except for a touch of white on the rump. Consult Hudson, '*Naturalist in La Plata*' (1903).

**GOLOSSES** (Fr. *galoche*, "a patten, clog or wooden shoe"): (1) a kind of wooden clog, with a joint at the instep and upper leathers like those of very low shoes, worn in the Middle Ages. (2) India-rubber overshoes, first manufactured in the United States and introduced into Great Britain about 1847. The term is now restricted to the latter meaning, and is used mostly in England, very rarely in the United States. See INDIA-RUBBER; RUBBER MANUFACTURES.

**GOLOVNIN**, Alaska, native settlement on Golovnin Bay, 10 miles east of Bluff. There is a Swedish Evangelical Union Mission and a school under the direction of the United States government. The natives are largely engaged in raising reindeer, of which they own more than 2,000 head. Pop. about 200.

**GOLTZ**, gōltz, Kolmar, BARON VON DER, German soldier and military author: b. Bielefeld, East Prussia, 1843; d. Asiatic Turkey, 19 April 1916. He was educated at the Berlin Military Academy, had seen extensive military service, having fought in the Austrian campaign and having been on the staff of Prince Frederick Charles in the Franco-Prussian War of 1870-71. At the close of the Franco-Prussian War, he was appointed to the historical department of the general staff at Berlin and for a time was instructor in the Military Academy. In 1883 he was sent to reconstruct the Turkish army and remained in Turkey for 13 years. He was made general of division on his return to Germany in 1896; general of infantry in 1900; commander of the first corps in 1902; general inspector in 1907, and lieutenant-general in 1908. In 1908-10 he was again in Turkey, engaged in reorganizing the army of that country. In 1911 he became general field-marshal and later was inspector-general of the second

corps until 1913. In August 1914, after the German armies had invaded Belgium and captured Brussels, he was appointed military governor of the occupied portion of the country, but in November of the same year, he was relieved of this command and sent to Turkey, where he was appointed military commandant at Constantinople, and acting Minister of War. He was instrumental in forming the successful Turkish defense on the Gallipoli Peninsula, and frequently predicted that the Anglo-French fleet would not be able to force a passage of the Dardanelles. In April 1915, he succeeded Gen. Liman von Sanders as chief of the first Turkish army. (See *WAR IN EUROPE*). He published 'Lion Gambetta und seine Armee' (1877; French ed. 1877); 'Das Volk in Waffen' (4th ed., 1890); 'Der thessalische Krieg und die türkische Armee' (1898); 'Krieg und Heerführung' (1901); 'Von Jana bis Eylan' (1907); 'Kriegsgeschichte Deutschlands im XIX Jahrhundert' (1910).

**GOLTZ, Max, BARON VON DER**, German naval officer: b. Königsberg, 19 April 1838; d. Potsdam, 20 Dec. 1906. He entered the Prussian navy in 1853, received rank as ensign in 1859 and that of captain in 1875. He commanded the German Mediterranean squadron during the Egyptian troubles of 1882; and in 1888 attained the rank of vice-admiral, with the appointment to the command of the Wilhelmshaven naval station. He was retired 13 May 1895 with the rank of admiral.

**GOLTZIUS, Hendrik**, Dutch painter and engraver: b. Mulebrecht, duchy of Jülich, 1558; d. Haarlem, 29 Dec. 1616. He came of a family of artists. He was taught to paint on glass by his father and his work as a steel engraver was begun under Coornheert, whose limited ability Goltzius soon surpassed. He later worked with Philip Gale, engraving for him a set of prints of the history of Lucretia. In 1590 he traveled in Germany and Italy, and conceived an intense admiration for Michelangelo, whom he imitated rather unsuccessfully. While some of his paintings are in the imperial collection at Vienna, none of them add greatly to his reputation, which is firmly established by his engravings. His portraits are chiefly miniatures and are considered very fine, and he executed an exceptionally good portrait of himself. His skillful use of the burin is ranked with that of Dürer, but he lacked a fine artistic appreciation. Nevertheless, his skill of technique and the free, beautiful lines of his work counterbalance other defects. Excellent examples of his engravings after the masters are afforded by his copies of Raphael's 'Annunciation'; Parmeggiano's 'Visitation'; Bassano's 'Adoration of the Shepherds'; Baroccio's 'Holy Family'; Lucas van Leiden's 'Adoration of the Kings'; and Dürer's 'Circumcision.' More than 300 of his engravings are in existence, and are catalogued in Bartsch's 'Peintre-Graveur' and in Weigel's supplement to that work.

**GOLUBOVICH, gò-lo-bò'vich, Girolamo**, Illyrian clergyman and author: b. Dalmatia, 7 Feb. 1865. He was educated at the Franciscan Convent, Jerusalem, entered the Franciscan Order in 1879 and was ordained to the priesthood in 1888. In 1888-89 he was librarian of the Franciscan Convent, Jerusalem, and from

1889 to 1895 he was engaged in missionary and parochial work at Larnaca and Limassol, Cyprus. In 1895 Cardinal Ledochowski conferred on him the title of missionary apostolic. He was successively professor of rhetoric, at the Franciscan Lyceum, Aleppo, Syria, and missionary to the Greeks, Slavs and Italians of Alexandria and Port Said, Egypt, in 1895-96. In 1902-04 he was vicar of the mission of Constantinople. He was appointed in 1898 historian of the Franciscan Mission of the Holy Land and in this capacity visited the libraries of Italy, Austria, Belgium, France and England, to collect and edit many rare documents. He was one of the editors of the works of Alexander of Hales and Bartholomew of Pisa 1904-07; and director of the 'Archivum franciscanum historicum' in 1907-08. After 1909 he was stationed at Florence. He has published 'Serie Cronologica dei Reverendissimi Superiori di Terra Santa' (1898); 'Il trattato di Terra Santa e dell' Oriente di frate Francesco Suriano' (1900); 'Ichnographia Locorum et monumentorum veterum Terræ Sanctæ, accurate delineatæ et descriptæ a P. Elzeario Horn' (1902); 'Bibliotheca Bio-bibliographica della Terra Santa e dell' Oriente Franciscano' (2 vols., 1906; 1913). He contributed to 'The Catholic Encyclopedia,' the 'Archivio storico italiano Missioni francescane; La Verna, etc.

**GÓMARA, Francisco Lopez de**, Spanish historian: b. Seville, 1510; d. 1560. He was professor of rhetoric at the University of Alcalá, took holy orders and afterward became secretary and chaplain to Hernando Cortez. He is reputed to have accompanied Cortez to America, but verification of this is lacking. He wrote one of the earliest histories of America, but as a historian he is notable rather for his easy, graceful style than for authenticity. He wrote 'Historia general de las Indias con la conquista de Mexico y de la Nueva España' (2 vols., 1552-53). A modern edition, with a biography of the writer, is included in 'Biblioteca de autores españoles' (Vol. XXII, Madrid 1884).

**GOMARISTS**, the ultra Calvinistic party in the Dutch National Church, so called from their leader, Francis Gomar (q.v.).

**GOMARUS, Francis**, Dutch theologian and the most eminent opponent of Arminius: b. Bruges, 13 Jan. 1563; d. Groningen, 11 Jan. 1641. His parents, upon embracing the Reformed faith, removed to the Palatinate in 1578 and Francis was sent to be educated at Strassburg. In 1580 he removed to Neustadt where he studied theology under Ursinus, Zanchius and Tossanus. He visited England in 1582 and attended lectures at Oxford and Cambridge, being graduated from the latter university in 1584. From 1587 to 1593 he was pastor of a Reformed Dutch church at Frankfurt and in 1594 became professor of theology at Leyden where he remained until 1603, when Arminius joined the faculty and disseminated Pelagianism. Gomarus opposed him with considerable success and was aided by Bogermann. Gomarus now became the recognized leader of the opponents of Arminius, who after him came to be known as Gomarists. In 1608 he engaged in personal debate with Arminius before the Assembly of the Estates of Holland and in the following year, in the same place, with four

colleagues met five Arminians in debate. When Vorstius succeeded Arminius, on the latter's death, Gomarus resigned his chair and became preacher at Middleburgh in 1611, where he also taught theology and Hebrew in the new Illustre Schule. In 1614 he was made professor of theology at Saumur and in 1618 removed to Groningen as professor of theology and Hebrew, at which post he remained until his death. He took part in the revision of the Dutch version of the Old Testament in 1633. His works were issued in a single volume (Amsterdam 1645). Consult Dörner, J. S., 'History of Protestant Theology.'

**GOMBERG, Moses**, American chemist: b. Elizabetgrad, Russia, 8 Feb. 1866. He studied at Elizabetgrad Gymnasium, and was graduated at the University of Michigan in 1900. He also studied at Munich and at Heidelberg. He was appointed to the teaching staff of the University of Michigan in 1893 and held successive positions there, becoming professor of organic chemistry in 1904. He is a member of the National Academy of Sciences, and in 1914 received the Nichols medal of the American Chemical Society. He has written numerous articles for chemical journals, notably for the *Journal of the American Chemical Society*, and the *Berichte der Deutsche Chemische Gesellschaft*.

**GOMEL**, or **HOMEL**, Russia, district town of the province of Mohilev, on the Soje, a tributary of the Dnieper, 108 miles southeast of Mohilev. It is an important railroad junction and has an extensive river trade. Its population is nearly half of Jewish origin, and in 1903 there was a massacre of the Jewish inhabitants. Its industries include sugar refineries, oil and paper mills; and it has a large trade in hops, timber, hemp and linseed. Pop. (with Byelitsa suburb) 79,000.

**GOMES DE AMORIM, Francisco**, Portuguese dramatist, poet and novelist: b. Avelomar, Minho, 13 Aug. 1827; d. 4 Nov. 1891. He spent his early youth in Brazil, returning to Portugal in 1846. He entered government service in 1851, and in 1859 became librarian of the Ministry of Marines. His years in Brazil had great influence over the work of his later years, as had also Almeida-Garratt, who accorded him much encouragement. He was deeply in sympathy with Garibaldi, and the Revolution of 1848, evidenced by 'Garibaldi' and 'A liberdade.' He wrote 'Cantos matutinos' (3d ed., 1874); and 'Ephemeros' (2d ed., 1866) in verse; the dramas 'Ódio de raça'; 'A proibição'; 'Ghigi'; 'O cedro vermelho,' etc.; in fiction 'Os Selvagens' (1875); 'O remorso vivo' (1876); and a history of the literary movement instituted by Almeida-Garratt, 'Memórias biográficas' (1881). His collected works were published (Lisbon 1866). Translations of his dramas into French were made by Denis and Richon.

**GOMEZ, gô'mês, Antonio Carlos**, Brazilian composer: b. Campinas, 11 July 1839; d. Pará, September 1896. He was a pupil at the Milan Conservatory, and had his first opera, 'A noite do castello,' presented at Rio de Janeiro in 1861. His 'Se sa minga' gained notable success at La Scala, Milan, in 1867, and was followed by a series of varying merit, including 'Guaraní' (1870); 'Salvator Rosa' (1874)

and 'Lo Schiavo' (1889). He wrote the hymn 'Il saluto del Brasile' for the Centennial Exhibition at Philadelphia (1876), and a cantata, 'Colombo,' for the Columbian Exposition (1893). He was director of the Conservatory of Music at Pará, Brazil, 1895-96.

**GÓMEZ, gô'mâsh, Estevan**, Portuguese navigator: b. about 1474; d. about 1530. He became an expert pilot in the Portuguese East Indian fleet, sailed in 1519 on Magellan's voyage as pilot of the *Trinidad* and was later transferred to the *San Antonio*, on board which he contrived a successful mutiny and then sailed for Spain. There he was imprisoned, but in a short time set free. It appears that in 1524-25 he was sent by Charles V to explore the eastern coast of what is now the United States and discover a northern route to the Orient. A map executed in 1529 by Diego Ribeira, a cosmographer, marks the territory included between the present States of Rhode Island and New Jersey, Tierra de Gómez. Consult Bourne, 'Spain in America' (New York 1904); HARRISSE, 'Discovery of North America' (London 1892).

**GOMEZ, José Miguel**, Cuban general and politician: b. province of Santa Clara, 1846. He served in the Ten Years' War 1868-78, and in the Revolution of 1906 attained rank as major-general. He was governor of the province of Santa Clara under the first American intervention, and was a member of the constitutional convention, continuing a governor of Santa Clara under President Palma. He was active in the revolution against President Palma in 1906 and was imprisoned until after the second American intervention. In 1908 he was elected President, inaugurated 28 Jan. 1909 and served until 20 May 1913, when he was succeeded by Gen. Mario Garcí Menocal. In 1917 he again led a revolt against the government, but was captured, imprisoned and held for trial.

**GOMEZ, Juan Vincente**, Venezuelan politician: b. San Antonio de Tachira, 1859. He entered political life in 1892 and at the time of President Castro's flight to Europe he, as vice-president, became acting president. He was elected provisional president in 1909 and constitutional president in 1910, and was successful in extricating his country from the difficulties with foreign countries in which his predecessor had entangled her. Upon the expiration of his term of president he was re-elected, but preferred to take office as commander-in-chief of the army, Marquez Bustillos acting as provisional president. Charges of alleged pro-Germanism were made against him in London and in Washington in 1917.

**GOMEZ DE AVELLANEDA Y ARTEAGA, Gertrudis**, Spanish dramatist and poet: b. Puerto Principe, Cuba, 23 March 1814; d. Madrid, 2 Feb. 1873. She removed to Spain in 1836, where her first volume of poems was published with a complimentary preface by Gallego in 1841. She was married to Pedro Sabater of the diplomatic service in 1846, but was widowed in less than a year. In 1853 she made a second marriage with Col. Domingo Verdugo. Her poetry in a measure bridges the gap between the classic and romantic schools, and while opinions differ as to her rank among poets she stands unquestionably first among the

Spanish women poets of her century. Her dramas were highly successful, but her novels were of little importance, her fame resting upon her poetic and dramatic works. Gifted with a high poetic sensibility to beauty, tragedy and devotion she nevertheless lacks somewhat in the broader scope of human sympathies; and her constructive power is often unequal to sustained effort, although she reaches a high point of eloquence and dramatic power in many instances. Her novels include 'Sab' (1839); 'Dos mujeres' (1842); 'Espatolino' (1844); 'Guatimozin' (1846), etc. Among her dramas are 'Leoncia' (1840); 'Alfonso Munio' (1844); 'Saul' (1849); 'Baltasar' (1858), etc. In verse 'Poesías líricas' (1841; enlarged ed., 1850). Her 'Obras literarias' (5 vols., 1869-71) have not been completed.

**GÓMEZ Y BAEZ**, *é bá'és*, **Máximo**, Cuban soldier: b. Bani, Santo Domingo, 1831; d. Havana, Cuba, 17 June 1905. When Santo Domingo revolted against Spain he served as lieutenant of cavalry in the Spanish army; and when the freedom of the island was declared he went with the Spanish army to Cuba, but left the army because General Villar maltreated some Cuban refugees. In 1868 he joined the Cuban insurrection, and through his ability and daring soon rose to a position of prominence, being in several successful engagements. Though deprived of his command at one time, he was soon recalled, and rose to be major-general. On the failure of the rebellion, he left Cuba and settled on a farm in Santo Domingo. Returning to Cuba, he was influential in bringing about the insurrection of 1895-98, and was made commander-in-chief of the Cuban army. His policy was to avoid open engagements and to drive the Spaniards out by devastating the island and constant harassing of their troops. When the Americans landed in Cuba (1898) he willingly co-operated with them. On 24 Feb. 1899 he marched into Havana at the head of his soldiers and was received by the United States authorities. In March of the same year he was deposed from his command by the Cuban Assembly on account of his accepting \$3,000,000 for his army from the United States. He assisted the American governor-general in his work in the island; was governor of the province of Santa Clara and a member of the Constitutional Convention; and he continued as governor under the presidency of Estrada Palma. He wrote 'Sanchito Gomez' and 'Mi Escolta' (1896), describing his campaigns in Cuba. Consult Carrillo, 'In the Saddle with Gomez' (New York 1898).

**GÓMEZ-FARIAS**, *fá-ré'ás*, **Valentín**, Mexican statesman: b. Guadalajara, 14 Feb. 1781; d. Mexico City, July 1858. He was appointed a professor in the University of Guadalajara in 1810, was a Liberal member of the first Constituent Congress, was elected Vice-President with Santa Anna, and in consequence of the latter's absence assumed executive powers 1 April 1833. In 1835 a constitutional congress refused to acknowledge his authority, and he was exiled. He returned in 1838; in 1840 led an unsuccessful revolt, and again was banished. Having returned in 1845, he was elected Vice-President in 1846; later a deputy to Congress, and was appointed Postmaster-General under Alvarez.

**GOMME**, Sir (George) Lawrence, English antiquary and folklorist: b. London, 1853; d. 24 Feb. 1916. He was educated at the city of London school and became statistical officer and clerk to the London common council. He was deeply interested in the rural customs of England, was founder, president and afterward vice-president of the Folklore Society, also acting as its secretary for some years. He was lecturer at the London School of Economics and University Extension, and editor of the *Antiquary*, the *Archaeological Review* and the *Folklore Journal*. He was secretary to the lieutenantancy of London and a Fellow of the Anthropological Institute. He wrote 'Primitive Folk-Moots' (1880); 'Chap-books and Folklore Tracts' (1885); 'Ethnology in Folklore' (1892); 'Governance of London' (1907); 'Folklore as an Historical Science' (1908); 'The Making of London, 1911' (1914), etc. He also edited 'The Gentleman's Magazine Library' (1883-1906); 'The King's Story-Book' (1897); 'The Queen's Story-Book' (1898); 'The Princes' Story-Book' (1899); 'The Princess's Story-book' (1900); and several editions of historical novels.

**GOMORRAH**. See **SODOM** AND **GOMORRAH**.

**GOMPERS**, Samuel, American labor leader: b. London, England, 27 Jan. 1850. He came to America with his parents and other relatives in 1863 and became an American citizen at the age of 21. A cigarmaker by trade, he has been known as a zealous worker in the cause of the rights of labor since his boyhood. He was one of the founders of the American Federation of Labor in 1881 and has been associated with that organization in an official capacity ever since, with the exception of two years. In 1908 he was sentenced to a year's imprisonment on account of defying a court order in connection with the Bucks' stove case, which denied the constitutional rights of free speech and free press as well as involved the abuses of the writ of injunction which deprived men of trial by jury and substituted judicial government for constitutional government. The case was appealed to the Supreme Court of the United States, and on 15 May 1913, Justice Lamar delivered the judgment of the court as follows: "The judgment of the court of appeals is reversed and the case remanded with directions to reverse the judgment of the Supreme Court of the District of Columbia and remand the case to that court with direction that the contempt proceedings instituted by the Bucks Stove and Range Company be dismissed, but without prejudice to the power and right of the Supreme Court of the District of Columbia, to punish by a proper proceeding contempt, if any, committed against it." Contempt proceedings were again instituted in the Supreme Court of the District of Columbia by Justice Wright, who again found Mr. Gompers guilty and imposed the same sentence. The case was again appealed to the Court of Appeals of the District of Columbia and to the Supreme Court of the United States. The Supreme Court dismissed the case because it was outlawed under the statute of limitations, but sustained the contentions of the American Federation of Labor that proceedings for contempt do not differ in essence from any ordinary charge of crime, and proceedings in contempt courts should be

the same as the proceedings in the case of crimes.

Under the leadership of Mr. Gompers in 1906, the American Federation of Labor inaugurated a non-partisan political campaign to secure necessary legislation assuring to the wage earners lawful opportunity for activities necessary to protect the rights and to promote the interests and welfare of the working people. According to this campaign the wage earners used their political influence to secure the nomination and election of government representatives regardless of party, who pledged themselves and announced their approval of labor's demands. The result of this political policy has been a group in Congress known as the labor group, the members of which hold trade union cards and are affiliated with some labor organization. This group has gradually increased until the 64th Congress there was one senator and 17 members in the House of Representatives. As the result of this political activity labor's demands for fundamental rights were enacted into law in the labor provisions of the Clayton Anti-trust Act, which became a law 15 Oct. 1914. Section 6 of this act contains the declaratory statement that "the labor of a human being is not a commodity or article of commerce." This declaration removes associations of wage earners from the provisions of trust legislation. Section 20 of the act limits and regulates the issuance of writs of injunction in conformity with the demands and contentions of the workers.

Under Mr. Gompers' direction the American Federation of Labor has become very powerful, and now includes every important union in the country. In politics, its hand has been seen indirectly in the enactment of the eight hour day legislation in reference to all work on government contracts and in enterprises connected with public utilities, also employers' liability laws. Mr. Gompers has constantly and successfully combatted all tendencies toward Socialism in the labor movement and is an active promoter of industrial conciliation. See AMERICAN FEDERATION OF LABOR.

**GOMPHOCERAS**, genus of Paleozoic mollusks with exceptionally full and rounded shells which become narrower toward the opening. They are related to the *Orthoceras* and are possibly an ancestral forerunner of *Phragmoceras*. There are about 150 specimens known, occurring in rocks of the Ordovician and Silurian Age of Europe and North America. The Silurian basin of Bohemia is especially rich in them.

**GOMPHOSIS**, or **EUGOMPHOSIS**, joint formed by the immovable implantation of one part in a socket situated in another, as in the socketting of the teeth in the jaws, or the styloid process in the temporal bone. It is also designated as articulation by implantation.

**GOMUTI**, or **GOMUTO**, or **GUMUTI**, known also as **Areng**, **Ejoo** or **Ejú** and **Wine Palm** (*Arenga saccharifera*), sago-palm of Malacca and the Malays, commonly cultivated in India and growing wild in Burma and Assam. It is cultivated for a variety of products, reaches a growth of from 20 to 40 feet tall with leaves from 15 to 25 feet long. The tree dies after flowering and producing its fruit and when the sago product is desired it is cut

before it flowers, usually at an age between 10 and 15 years. The first product is that of the black horsehair-like fibres, known as the *cjú* or *gomuti* fibre, which grow abundantly from the base of the leaves. The fibre is manufactured into cordage and is plaited for use as ornaments. It is not sufficiently pliable for running rigging but for other purposes is desirable because of its strength and imperviousness to the effects of water. The stiffer fibres are used as styles for writing on palm leaves; and within the sheaths is a woolly fibre, called *lara*, which is in demand in China for the caulking of boats, and is also used for filling cushions. The coarsest fibre is used for brush-making and thatching, and sandals are manufactured from the leaf. The sap is obtained by cutting the flowers and from it is manufactured palm wine, spirits, sugar and vinegar. The tree also furnishes Java sago; which, while inferior to that of the true sago-palm, is an important addition to the food supply throughout the Malays. It is scarcely profitable for cultivation for its sugar, but the yield of sago is about 150 pounds per tree, and as 400 trees may be planted to the acre the yield is enormous. When the palm is permitted to flower and fruit it dies and the stem soon becomes hollow; and as the wood is remarkable for its lasting qualities when subjected to immersion in water it is much used for troughs and watering channels, lasting well even when placed underground.

**GONAIVES**, *gô-nâ-év'*, Haiti, town on the west coast on the bay of the same name, 65 miles north-northwest of Port au Prince. It has an excellent harbor, a naval and military hospital and a mineral spring. The exports are cotton, coffee, logwood, salt and mahogany. On 1 Jan. 1804 the independence of Haiti was proclaimed here by Dessalines, and in 1914 two battles were fought here between rebel and government forces. A United States consul is situated here. Pop. 15,500.

**GONAS**. See **HOTTENTOTS**.

**GONÇALVES DIAZ**, Antonio, Brazilian poet: b. near Caxias, Maranhão, 1823; d. at sea, September 1864. He studied law at the University of Coimbra, Portugal, but upon returning to Brazil in 1845 he engaged in literary pursuits at Rio de Janeiro as a newspaper writer and poet. His first volume of poems, 'Primeiros Cantos' (1846), established his reputation as a poet, being remarkable both for their interpretation of Brazilian national feeling and as bearing the imprint of his own individuality. His 'Segundos Cantos e sextilhas de Frei Antão' (1848) confirmed his reputation for clear, beautiful expression and easy rhythm. He was appointed professor of Brazilian history at the Imperial College of Pedro II at Rio de Janeiro in 1849 and in 1851 published his 'Últimos Cantos' which practically concluded his contributions to poetry. In 1851-59 he was engaged in government service, studying educational institutions in northern Brazil and in Europe. Returning to Brazil in 1860 he was appointed to the expedition sent to make a historical and ethnographical survey of the province of Ceará. Illness compelled his resignation in 1862 and it was when he was returning from a trip to Europe, in which he sought to restore his health, that he perished

in a shipwreck off the shores of Brazil. Besides the three volumes of verse already mentioned he was author of 'Os Tymbiras' (1857); 'Diccionario da lingua Tupy' (1858). He wrote many reports upon his government investigations and had written a considerable part of a work entitled 'Historia des Jesuitas de America.' A complete edition of his lyrical poems was published under his own direction at Leipzig and his complete works were published in Rio de Janeiro.

**GONCHARÓF**, gôn-châ-rôf', **Iván Alek-sandrovitch**, Russian novelist: b. 18 June 1812, at Simbirsk, on the Volga River; d. Saint Petersburg, 27 Sept. 1891. His father was a member of the merchant class, but died at an early age, leaving the three-year-old boy in the charge of his mother, a woman of unusual character and ability. He was at first educated at home especially under the direction of his godfather, a former seafaring man who had retired from service and was an inmate of Goncharóf's household, where his general culture, his sense of humor and his inexhaustible fund of anecdotes and reminiscences of travel in all parts of the world made him the central figure in the best society of the prosperous provincial capital. The boy was in due time entered at a boarding-school attended by the sons of wealthy landed proprietors, and the principal teacher, a priest of a different type from the usual country clergyman, who had graduated from the Theological Seminary of Kazán, was a man of culture and breeding and was married to a French lady who taught her native language to the students. The school possessed an excellent library of Russian and foreign masterpieces—history, fiction, poetry and books of travel—some of which Goncharóf not only read but even learned by heart. At the age of 12 he was sent to Moscow where his passion for reading was still further stimulated and he made great progress in French, English and German. In 1831 he entered the Moscow University in the department of philology. Here he came under the influence of an unusually able corps of professors whose lectures on history, literature, archæology and art appealed to his best ability and confirmed him in his love for all that was lofty and beautiful. After finishing the full course he returned to his home for some months and then proceeded to Saint Petersburg where he entered the service of the Ministry of Finance as interpreter. He became acquainted with the brilliant circle of novelists, poets and journalists, the two Maikof brothers, Nekrasóv, Byelinsky, Panayef. He was thus drawn to literature and wrote his first novel 'An Ordinary Story' (Obiiknovánniya Istóriya), the first part of which appeared in *The Contemporary* (*Sovreménnik*) in 1847. He was already planning a new work and even went so far as to print some chapters of it under the title, 'Obolomof's Dream,' but in 1852 he accepted an offer from the Ministry of the Marine to accompany Admiral Putyáin as his secretary on a trip around the world with the aim of concluding a treaty with Japan. The result of this experience was given to the public in 1856 and 1857 in two large volumes entitled 'Frigate Pallada.' During his journey he worked desultorily on 'Obolomof' and after his return he went to Carlshad and finished it in

about a month and a half. It was printed in 1858 and 1859 in the *Annals of the Fatherland* and immediately created an immense sensation, the hero of the story being recognized as a very distinctive Russian type. His official duties and his social diversions largely interfered with his literary activities and he waited 10 years before he published his next and final masterpiece of fiction, 'The Precipice' (or 'The Abyss'—Obruif) which came out in the *European Messenger* (*Výestnik Yevrópai*) and in book-form in 1870. His collected works also comprise critical articles and translations.

NATHAN HASKELL DOLE.

**GONCOURT**, de, dè gôn-koor, **EDMOND LOUIS ANTOINE HUOT**: b. Nancy, 26 May 1822; d. 16 July 1896; and **JULES ALFRED HUOT DE**: b. Paris, 17 Dec. 1830; d. Auteuil, 20 June 1870: French novelists. The Goncourt brothers were not men of letters but artists primarily, and in 1849 they set out, knapsack on back, to traverse France for drawings and water-colors. Their notebooks made them writers as well as artists, and already in 1852 they had commenced that literary partnership which continued nearly 20 years. Their earliest serious works were a group of historical studies upon the second half of the 18th century, intended to be an effective resurrection of its habits of life, manners and costume, which, though elaborate in detail, lacked calm and impartial historical sense, breadth of view and creative grasp of character. These books were 'Histoire de la Société Française pendant la Révolution' (1854), 'La Société Française pendant le Directoire' (1855); 'Portraits intimes du XVIII Siècle' (1856-58); 'Histoire de Marie Antoinette' (1858); 'Les Maîtresses de Louis XV' (1860-79); 'La Femme au XVIII Siècle' (1862) and 'L'Amour au XVIII Siècle' (1877); 'Gavarni' (1873) and 'L'Art au XVIII Siècle' (1874). The more important work of the De Goncourt brothers was their novel writing; their conception of the novel was that it should be an imaginative attempt to grasp and summarize the results of close and minute observation; their aim was to paint manners by taking the traits in which one man resembles a class; hence they select as generic types only persons of moderate faculties. Their 'Journal' (1897-96) is a poignant and significant literary document, valuable for its information on the literature of the period. Their novels, descriptive not so much of passion as of manners, include 'Les Hommes de Lettres' (1860), republished in 1869 under the title, 'Charles Demailly'; 'Sœur Philomène' (1861), describing the hospital life of a Sister of Charity; 'Renée Maupérin' (1864), a study of social life; 'Germinie Lacerteux' (1865), a character study of the gradual degradation of a domestic; 'Manette Salomon' (1867), in which an artist's model plays the part of human vampire; and 'Madame Gervaisais' (1869), a study of mysticism. After the death of his brother, Edmond wrote the 'La fille Elisa' (1878), a novel; 'L'Œuvre de Watteau' (1876), 'L'Œuvre de Prudhon' (1877); and 'La Maison d'un Artiste' (1881).

On his death, Edmond de Goncourt left the greater part of his fortune to found an academy—the Académie Goncourt—and the first members of which were nominated by him.

They receive each an income of 6,000 francs; but membership is forfeited on election to the French Academy. Consult Bellock and Shedlock, 'Edmond and Jules de Goncourt' (1895); Paul Bourget, 'Nouveaux Essais de Psychologie' (1885); Delzant, 'Les Goncourts' (1889); Wells, 'A Century of French Fiction' (1898).

**GONDAR**, or **GUENDAR**, Abyssinia, former capital of Amhara, about 21 miles northeast of Lake Tsana, and on a spur of the Wogara Mountains, 7,500 feet above sea-level. The town is in a more or less ruined condition, having suffered severely in the civil wars of Abyssinia and being ruthlessly damaged by Emperor Theodore II in 1868. It was a loosely built town of districts divided by open spaces and at the beginning of the 16th century was a small village. It became the capital of the kingdom by choice of Seged I. It was the seat of many churches, castles and palaces and was at its height in 1736 when the last of the palaces, that of Negus Yesu II was built. From that time until the British pacification of the Sudan in 1886-89 Gondar was repeatedly sacked and fired. The population dwindled from an estimated 50,000 in 1770 to about 7,000 in 1905. The ruins of the castles and palaces of Gondar show traces of the Portuguese population at one time numerous there, the buildings resembling in a measure the mediæval fortresses of Europe. The churches were built in the circular Abyssinian manner, but of the 44 which once existed in Gondar or its immediate vicinity but one remained without serious injury in 1900. The population is chiefly Mohammedan and there is a settlement of Falashas. With the pacification of the country the fortunes of the town have improved and with an increasing population there is now a trade between Gondar and the Blue Nile. The industries number those of gold and silver ornaments, cotton and cotton cloth, shoes, saddles and carvings in bone and ivory. Consult Powell-Cotton, 'A Sporting Trip Through Abyssinia' (1902).

**GONDOKORO**, or **ISMAILIA**, Uganda, trading-station and formerly a government post, on the east bank of the upper Nile, 1,070 miles south of Khartum by river and 350 miles northwest of Entebbe on Victoria Nyanza. It was first visited by Europeans in 1841-42 and was at one time an important slave-trading centre. A British military station was established there in 1871 but was abandoned by Gordon in 1874 because of the town's unhealthy situation. The Mahdists gained control of it in 1885, but the town was reoccupied by British troops in 1898. As the head of the navigation of the Nile Gondokoro is of considerable importance, the journey from there to Uganda being made overland, and it constitutes an outlet for the produce of that territory. An Austrian Roman Catholic mission was maintained there in 1851-59 and the town is of some prominence in the early explorations of Africa. It was named 'Ismailia' in honor of the reigning khedive by Governor-General Baker at the time of his establishment of a military post there in 1871.

**GONDOLA**, a long, narrow boat used on the canals of Venice. The middle-sized gondolas are upward of 30 feet long and 4 to 5

feet broad; they always terminate at each end in a sharp point, which is raised perpendicularly to the ordinary height of a man. They have a well-furnished cabin amidship. They are propelled by rowing; the oarsman or gondolier stands in the stern facing forward; sometimes there are two gondoliers, the second one standing in the bow. They are usually painted black in accordance with an old law of the Venetian republic, which prescribed that all gondolas should be black, except those of the Doge and the foreign ambassadors. The gondolas were until recently the only means of getting about the city; now steam-launches, acting as omnibuses, are also used.

**GONDS**, an aboriginal race of British India, a remnant of the Dravidians who were driven out of the plains by an early Aryan invasion. They took refuge in Gondawana, a territory almost identical with what are now called the Central Provinces. Here their seat was the Satpura plateau, between the rivers Pain Ganga, Pranhita and Godavari on the west and the Indravati on the east, while they were bordered on the north by the river Nerbudda. They still retain their dominion in the mountain forests of Orissa. Gondrin dynasties reigned from the 14th to the 18th centuries, when they were subdued by the Maharrattas. Since 1781 they have become subjects of England, and their speech and religion have more and more conformed to those of the Hindu. Their language, known as Gondi, is a Dravidic branch of the Dekhan language. Their occupational groups are endogamous; bards, soothsayers, iron-workers, dancers and prostitutes, etc., forming practically separate castes. Their religion is animistic; ancestors are deified. Their religion consists in a worship of many spirits and they are enslaved to their priests. They have distinct physical characteristics which differentiate them from the Hindus. They are small in stature, well-proportioned, swarthy, almost black in complexion; their hair is long and black, though sometimes it is of a ruddy tinge. In countenance they have a broad forehead and small, deep-set eyes. They wear little clothing. One of their clans, the Moria, tattoo their faces and shave their heads. Their total numbers over 2,500,000. Consult Forsyth, 'Highlands of Central India' (1889); Dalton, 'Descriptive Ethnology of Bengal' (1872); Risley, 'Tribes and Castes of Bengal' (1892); Holderness, 'Peoples and Problems of India' (1912); and the article 'Gondwana' in Hunter's 'Imperial Gazetteer of India' (1908).

**GONFALON**, an ensign or standard which used to be borne by the chief magistrates of many Italian cities, as Florence and Lucca. These magistrates were hence called gonfaloniers. The title of gonfalonier was also sometimes bestowed by the Roman Catholic Church on persons of distinction, who were called gonfaloniers of the Church.

**GONG**, an instrument of Chinese origin, made of a mixture of metals and shaped into a basin-like form, flat and large, with a rim a few inches deep. The sound of the gong is produced by striking it, while hung by the rim, with a mallet, which puts the metal into a state of vibration and produces a loud piercing

sound. The modern gong or gong-bell is sounded by striking it with a hammer operated by machinery.

**GÓNGORA, Luis de Góngora y Argote**, gōn'gō-rā ē ār-gō'tā gōn'gō-rā, Spanish lyric poet: b. Cordova, 11 July 1561; d. there, 24 May 1627. About 1614 he entered the Church and became a prebendary of the cathedral at Cordova, and eventually chaplain to Philip III. Góngora's earlier writings—sonnets on a great variety of subjects, lyrical poems, odes, ballads and songs for the guitar—are inspired with much true poetic feeling. His later works, consisting for the most part of longer poems, such as 'Solidades' (or Solitary Musings), 'Polifemo,' 'Pyramo y Thisbe,' are executed in an entirely different and novel style, characterized especially in respect of diction, by some of the same distinctive features as are found in Euphuism in England and Chabrierism in Italy. This later style of Góngora, which his followers and imitators designated the *stilo culto*, is florid, pedantic, full of Latin inversions and mythological allusions, pompous and mannered, and in many places very obscure. He became the founder of a school, the Góngoristas or Culturanos, who were, if possible, more absurdly euphuistic than their master. His works were never published during his lifetime. The first edition was printed by his friend, Vicuña, in 1627. Consult Churton, 'Góngora' (1862).

**GONIATITES**, gō'ni-a-ti'tēz, a genus of ammonites (q.v.), including the earliest forms characterized by the structure of the septa, which are lobed, but without lateral denticulations, as in the higher ammonites; they consequently exhibit, in a section, a continuous undulating line. Some forms with slightly waved septa approach very near to the Nautilus. The siphonal portion is shorter than the sides, forming a sinus at the back, as in the Nautilus. The last chamber, the one tenanted by the animal, occupies a whole whorl, and has besides a considerable lateral expansion. The shells are small, seldom exceeding six inches in diameter. This genus is confined to the Palæozoic strata, especially the Upper Devonian and Lower Carboniferous.

**GONIOCERAS**, mollusk of the order of nautiloid cephalopods, marked for its widely variant forms but in the main of triangular shape, somewhat flattened (*Gonioceras anceps*). It occurs in the Ordovician limestones of New York State and Canada and also in the extreme northern parts of North America and China.

**GONIOMETER**, a device for measuring the angles of crystals. The application goniometer may be likened to a protractor with a rotary radius. It is a semi-circle hinged at 90 degrees, to which are attached two arms of steel which are directly applied to the crystal whose angles are to be measured. Far more accurate is the reflecting goniometer, consisting of a graduated circle mounted either vertically or horizontally upon a stand with an apparatus for adjusting the crystal, and one or two telescopes; it determines through what angular space the crystal must be turned that two rays of light reflected in turn from two surfaces shall have the same direction.

**GONIOPHOLIS**, a primitive crocodile of the Jurassic Period. It is distinguished from modern crocodiles by several features, espe-

cially by the bi-concave vertebræ and the arrangement of the bony plates on the back. It once inhabited the Jurassic swamps and river-deltas in Europe and America, along with dinosaurs, turtles, etc. A complete skeleton is now exhibited in the Brussels Museum.

**GONORRHEA** is perhaps the most universal and widespread of all diseases that affect the human race. Competent authorities have computed that fully three-fourths of the adult male population and from one-sixth to one-third of the adult female population have contracted this disorder. The great majority of women who have gonorrhea are reputable married women who have been infected by their husbands. Material as well as moral and sanitary conditions modify venereal morbidity. It is much greater in large centres of population than in suburban and rural communities.

**Definition.**—Gonorrhea may be defined as a specific inflammation peculiar to certain mucous membranes, attended with the production of a purulent discharge. This discharge has the property of exciting a similar inflammation when brought in contact with other mucous surfaces susceptible to its action. The urethral mucous membrane in the male and the mucous membrane of the urethra, vagina and cervix in the female are ordinarily the seat of gonorrheal inflammation. Almost all mucous surfaces of the body, particularly the conjunctival mucous membranes, are susceptible to the irritant action of gonorrheal pus.

**Cause.**—The cause of gonorrhea is a specific micro-organism termed the gonococcus, which was discovered by Neisser in 1879. Inflammation of the urethra may result from a multiplicity of causes, chemical, irritant and others, but true gonorrheal inflammation has as its unique etiological factor the gonococcus.

**The Gonococcus.**—This micro-organism is a diplococcus; in shape each individual of a pair resembles a coffee bean—flat or slightly concave on one side and rounded on the other, with their flat surfaces opposed. The two hemispheres are separated by such a narrow interval that it is only recognizable under a lens of high power. The diplococci are grouped in pairs, fours and other multiples of two. Their growth occurs by fissure, at right angles to the central interspace. The gonococci are always grouped in irregularly shaped columns and are never met with in chains or pairs, as certain other micro-organisms. The differential characteristic of the gonococci is, that they quickly take a stain of aniline dyes and are more rapidly bleached than other micro-organisms. They may occur both within and without the pus and epithelial cells. In acute cases they are very numerous, but have a tendency to grow fewer with the decline of the inflammatory process. They are characterized by a marked longevity, are susceptible of existing in a latent state for an indefinite period and are capable of being revived and exalted in virulence by local irritation which causes congestion of the parts, or when transferred to virgin tissues in which they find conditions favorable for their germination and growth. Numerous cases are on record where the gonococcus has been found still conserving all its virulence and susceptible of being provoked into new activity by a variety of irritant causes years after infection.

Within the past two or three decades our knowledge of gonorrhea has undergone most marked and revolutionary changes. The old conception of gonorrhea was that of a purely local disease, confined to the mucous tract in which it had its habitual origin, trivial in character, of limited duration and entailing no serious consequences to the individual, except from neglected complications. The occasional occurrence of rheumatism or of ophthalmia, which was recognized by the older observers, was thought to be due to the development of a latent rheumatic diathesis, to sympathetic inflammation or simple metastasis. The idiosyncrasy of the patient was thought to play an important rôle in their production.

Since the discovery of the gonococcus, new facts have been developed, showing that instead of being limited to the genito-urinary tract, the range of its morbid action is much more extensive and not infrequently is radiated to important internal organs. As a result of modern investigations it may be positively affirmed that the gonococcus is susceptible of being taken up by the blood vessels and lymphatics, and that it may affect almost every organ of the body. Staining and culture experiments have demonstrated its presence not only in the ovaries, tubes and peritoneal cavity, which it reaches through invasion of the intermediate mucous membrane, but also in the lining membrane of the brain and cord, of the heart, of the pleura, liver, spleen, kidneys, as well as the joints and tendinous sheaths.

The number, variety and gravity of these systemic manifestations has led to the serious consideration of the question whether gonorrhea is not to be classed as a constitutional affection. The cause or relation between these systemic affections and the gonococcus has been proved by the identification of the gonococcus in the lesions it has produced. These general effects have been also ascribed not simply to the pathogenic action of the gonococci, but to their toxins and the presence of certain pyogenic microbes associated with the gonococcus.

**Complications.**—The more common complications of gonorrhea are acute and chronic inflammation of the postate and bladder and seminal ducts and vesicles, the cord and testes.

**Gonorrheal Arthritis.**—One of the most important complications of gonorrhea is seen in certain joint-affections, which are usually described under the term of gonorrheal rheumatism. This complication usually occurs from the second to the third week of the disease, but may develop as early as the fifth or sixth day. Gonorrheal arthritis manifests a remarkable affinity for the large articulations, as the knee and ankle joints, the hip and elbow. Only one joint may be involved, constituting what is termed mono-articular arthritis, or a number of joints may be involved, constituting poly-articular arthritis. In the latter case, different joints are more likely to be involved in succession, rather than simultaneously. As a result of the inflammation of the synovial membrane, which is particularly involved, there often occur serous, fibrinous or purulent effusions. It is essentially a hydrarthrosis, and in most instances the disease is confined to the synovial membrane of the joint during the whole course of the affection. Gonorrheal arthritis is usually

chronic in duration, often lasting from two to three or for many months. In some cases it is chronic and practically indefinite. Ankylosis or immobility of the joint from rapid formation of adhesions is a not infrequent termination. Very often the tendinous sheaths, the bursæ and fascia may be involved.

Unfortunately the treatment of gonorrheal rheumatism is extremely unsatisfactory. It does not seem to be susceptible to the curative action of remedies which are valuable in attacks of ordinary rheumatism. In quite a large proportion of cases there is more or less deformity or permanent disability.

**Gonorrheal Ophthalmia.**—There is usually recognized a distinction between an ophthalmia which is due to a septic absorption, like gonorrheal rheumatism, and that form of purulent conjunctivitis which is caused by direct transference of pus containing gonococci to the eye. The former never results from the direct inoculation of the contagious matter. Its symptoms are milder, and there are rarely changes which occasion adhesions or permanent injury to the sight. On the contrary, purulent conjunctivitis is due to the inoculation of the mucous membrane of the conjunctiva. The inflammatory process is characterized by greater intensity and rapidity of action, and not infrequently results in partial or complete loss of vision. Unless prompt and efficient treatment be at once instituted the cornea may rapidly ulcerate and slough, and prolapse of the contents of the globe of the eye may occur through the perforation. These changes are sometimes almost incredibly rapid, taking place in three or four days, exceptionally in 24 hours, and leading to complete destruction of vision. In the ophthalmia of the new-born, the eyes of the child are liable to be soiled with the uterine and vaginal liquids containing gonococci—one of the most frequent causes of blindness. It is estimated that from 10 to 20 per cent of all blindness is caused by gonococcal infection.

**Gonorrhea in Women.**—Our knowledge of gonorrhea in women is essentially a modern acquisition. Until within recent years it had never been the subject of serious and careful study. In the female the local and general effects of gonorrhea are apt to be much more serious and permanent, owing to the extent and character of the structures exposed to infection. The greater extent of the genital tract permits a larger field for infection by direct continuity of tissue. The periodic vascular changes incident to the menstrual period, and the more pronounced modifications caused by pregnancy, exert a marked influence in accentuating the gravity of gonorrhea in women. As a result of these changes gonococci, invading the uterine cavity and ascending along the tubes and ovaries to the peritoneal covering, produce peritonitis. Not only do these inflammatory changes imperil the life and health of the woman (which danger, in many instances, can only be averted by an operation involving the sacrifice of her reproductive organs), but they may absolutely extinguish her hope of children. Gonorrhea is one of the most prolific causes of sterility. The inflammatory changes result in the blocking up of the channels of communication between the ovaries and the uterine receptacle of the ovum, thus preventing contact with

the germinative spermatozooids. This mechanical obstacle to the passage of the ovum is, as a rule, permanent and irremediable. It thus happens that the aptitude of the gonorrheic woman for conception is often extinguished by the first pregnancy, the first child representing the sum total of her productive energy. In this connection, it may be said that one of the complications of gonorrhea affecting the male (epididymitis) is a very frequent cause of sterility in men. Neisser believes that gonorrhea in the male is responsible for 45 per cent of sterile marriages. The proportion of sterility due to the husband is variously estimated from 17 to 25 per cent, and almost the entire proportion of sterility in women is due to gonorrhea communicated to her by her husband. The low birth-rate of married women is not, as is generally supposed, always voluntary, but it often proceeds from physical causes relating to the health or productive capacity of the married parties; it is not from choice, but from incapacity.

**Gonorrhea as a Social Danger.**—Owing to its great frequency, the persistent vitality and virulence of its germs, even after apparent cure, and especially to the grave nature of the infection in women, and the serious menace to the health and even the life of the victim—to say nothing of its destructive effects upon the procreative functions—gonorrhea is now regarded by the medical profession as one of the most formidable social plagues of our age. Every year in this country thousands of young, innocent women are infected by their husbands, who in most cases are not aware that they carry with them the germs of a disease destined to wreck the health or lives of their partners. Many such women drag out a miserable existence of semi-invalidism, subject to painful or difficult menstruation, no longer able to walk freely, condemned to pass their days of suffering in a reclining position; and after years, it may be, of this suffering, worn out and desperate, they apply to the surgeon, who, at the price of the sacrifice of their generative organs, renders their existence possible in making them castrated women.

**GONSALVO DE CORDOVA**, gôn-sál'vô dê kôr'dô-vâ (Sp. gôn-thâ'lô dâ kôr'dô-bâ), in full GONSALVO HERNÁNDEZ DE CORDOVA Y AGUILAR, Spanish warrior: b. Montilla, near Cordova, 1453; d. Granada, 2 Dec. 1515. At the court of Ferdinand and Isabella, Gonsalvo attracted much attention by his personal beauty, his knightly skill and the magnificence of his apparel and style of living. In the war with Granada, 1481-92, he took many places by storm and vanquished the boldest Moors who dared to meet him in single combat. He was selected to carry on the difficult and dangerous negotiations with the Moorish king Abu Abdallah (or Boabdil), which resulted in the capitulation of Granada and the termination of Moorish rule in Spain. He helped Ferdinand II, king of Naples, to drive the French over the Neapolitan frontiers, and in 1500 delivered Zante and Cephalonia from the Turks and restored them to Venice. In the war between France and Spain, for the sovereignty of Naples, Gonsalvo gained successive victories, until by the fall of Gaëta, the French were forced to yield their claim upon Naples. Fer-

dinand now bestowed upon him the duchy of Sessa, and appointed him viceroy of Naples, with unlimited powers, which post he held until 1507, when the jealousy of the king caused his removal.

**GONVILLE AND CAIUS** (kêz) COLLEGE, a college of Cambridge University, England, was founded in 1348 by Edmund Gonville of Terrington, Norfolk, and endowed for a master and three fellows. The original site was between Free School Lane and the churchyard of Saint Botolph's. In 1535 William Bateman, bishop of Norwich, Gonville's executor, established the college where the Gonville Court at present stands, and altered the name to the Hall of the Annunciation of Blessed Mary the Virgin. In 1557 Dr. Caius obtained the royal charter by which all the former foundations were confirmed and his own foundation was established. By this charter the college was thenceforth to be called Gonville and Caius College. New statutes were given by which the college is henceforth to consist of a master, 30 fellows and 36 scholars. The fellowships are all open, and are not vacated by marriage, but terminate generally at the end of 10 years from the full standing of M.A. The scholarships are also open. There are also connected with this college four studentships of medicine founded by Charles Tancer, and two Harrow scholarships. Sir Thomas Gresham, Judge Jeffreys, Jeremy Taylor and Lord Chancellor Thurlow were connected with this college. Consult Venn, 'Caius College' (1901).

**GONZAGA**, gôn-zâ'gâ, Thomaz Antonio, Brazilian poet; called the Portuguese Anacreon: b. Oporto, August 1744; d. Mozambique, 1809. After studying law in the University of Coimbra, Portugal, he returned in 1768 to Brazil to enter on an official career, where he eventually became judge at Villo Rica in the province of Minas. In 1788 he was about to marry Maria de Seixas, a young lady of distinguished beauty, when he became involved in a political conspiracy. The court condemned him to perpetual exile on an island on the coast of eastern Africa, which by special favor it was commuted to 10 years' banishment to Mozambique. He left Brazil in 1793, and was attacked by fever soon after reaching Africa, from which he recovered only to fall into madness from the effect of the climate. The most interesting of his poems were composed during his captivity, and celebrate in mournful and tender verse the object of his love under the name of Marilia. These are the finest collection of erotic verse written in Portuguese to one person. They are popular alike in Brazil and Portugal, and have been often reprinted. In grace, tenderness, purity of style and harmony of verse, Gonzaga ranks among the first Portuguese poets.

**GONZAGA FAMILY**, a noted Italian family which held the supremacy in Mantua 1328-1707. On 14 Aug. 1328 LUDOVICO (or LUIGI GONZAGA) assumed the sovereignty after his sons had driven out the Bonacors' family and taken possession of Mantua. He died 1360, aged 93. Among his descendants, GIAN FRANCESCO GONZAGA, in 1432, obtained possession of the city, with its territory, under the title of marquise, as a fief from the Emperor Sigismund. GUGLIELMO (1550-87) and VICENZO (1587-

1612), both rulers of note, were patrons of the Tasso family, the father of the poet having been secretary to the former. Among the noted scholastics of the family was LUIGI GONZAGA (1568-91), a Jesuit who, canonized as Saint Aloysius, became the patron saint of students. With VINCENTO II, the reigning line became extinct in 1627. The next heir would have been the Duke of Nevers, but the Duke of Guastalla, Ferdinand II, one degree more remote, laid claim to the whole inheritance, and Charles Emanuel, Duke of Savoy, claimed Montferrat. It was evident that the house of Nevers had a legal right, and France, Venice and the Pope supported him. Spain and Austria, on the other hand, supported the groundless claims of the Duke of Savoy, whence arose a war concerning the Mantuan succession, which ended with the triumph of Charles, Duke of Nevers. His grandson, CHARLES III, succeeded him in 1637, and during his reign the principality obtained full independence. He died in 1665. Many persons of his family have obtained military renown. Others have been conspicuous for their love of the arts and sciences. CÆSAR, in 1565, erected the academy Degl'invaghiiti; and others of the family founded galleries of paintings and antiquities. Giulio Romano, under their patronage, established an extensive school for painting, and many celebrated artists received from them support and honor. Consult Hare, C., 'A Princess of the Reformation' (New York 1912); Solari, E., 'Ercole Gonzaga' (Venice 1904); Symonds, 'The Renaissance in Italy' (London 1898).

**GONZÁLES**, gôn-sál'ēs, Count Fernán, a half mythical, half historical character who figures prominently in the literature of the early days of the conflict between Moor and Christian in Spain, d. 970. Legend makes him the hero of many battles and credits him with playing a prominent part in the recovery of Castile from Moorish control. He first came into prominence at the battle of Osuma (934); and his activities were confined to the northern part of Spain. A long poem in praise of Fernán González still survives. It covers the period between the first incursion of Spain by the Goths and the year of the battle of Moret (967). This poem, which in general is prosy, affords little that is not told elsewhere. It seems to be a poetical copy of the 'General Chronicle' of Alfonso the Wise, and to have been intended for public recitation. Many of the incidents of the heroic struggle between Christian and Mohammedan are spiritedly told, and the form of the poem and its simplicity are well calculated to interest the age for which it was written. It is undoubtedly one of the many imitations of the 'Book of Apollonius' (q.v.) and the popular poems of Berceo. In fact the opening of this chronicle of the doings of Fernán González consists of an invocation copied from Berceo's 'San Domingo de Solis.' But the imitation, in general, is one of style, division and handling of subject and employment of the rhyme form common to the 'Apollonius' and Berceo.

**GONZALES**, Manuel, Mexican soldier and statesman: b. near Matamoros, 18 June 1833; d. Mexico City, 8 May 1893. He entered the army in 1839 and fought under Juárez in 1861. In the war against the French he joined Esco-

bedo in 1865 and was made a brigadier-general and governor of the legislative palace. Later he joined the party of Díaz and took an important part in the battle of Teocac (1876) which gave Díaz the upper hand in Mexico and made him President. He was Secretary of War under Díaz, 1877-80, and followed him as President of the Mexican Republic, 1880-84. After his retirement he was governor of Guanajuato.

**GONZALO DE BERCEO**, gôn-thà'lō dā bār-thā'ō, who flourished during the first half of the 13th century, was a secular priest of San Millan Monastery, Spain, and an innovator in Spanish poetry. Little is definitely known of his life; but from internal evidence in his works, he probably died about 1260 at an advanced age. His writings are all of a religious character and breathe the spirit of faith and simplicity of his age. Berceo, as he was popularly known from the place of his birth, considerably improved the written Spanish of his day, but his work lacks the power, movement and vivacity of the Cid. Berceo's innovation in Spanish literature consisted in the use of what he called the "quaderna via," a succession of four lines rhyming with one another. This was a peculiarity which attracted attention at a time when the Spanish language was just beginning to graft rhyme on to its alliterative verse. It caught the public fancy to such an extent that there followed a deluge of rhyme, which was often far from being wisely or artistically used. However, on the whole, the introduction of Berceo was of decided advantage to Spanish poetry; and his rhyming system was not only imitated, but continued to retain its popularity for more than two centuries. The works of Berceo, which are of considerable extent, consist of poetical lives of San Millan, San Domingo de Silos, and Santa Orita of the 'Martyrdom of San Larenzo,' 'Signs Preceding the Last Judgment,' various poems on the Madonna, including the 'Miracles of the Virgin' and the 'Madonna at the Cross,' hymns and poems on the mass. Nearly all of this work is written in the four-line interrhyming stanzas introduced into Spanish literature by Berceo. The popularity of the subjects treated in a religious age and the novelty of the rhyme raised up for Berceo a school of imitators many of whom carried the repetition of rhymes to a wearisome excess. Berceo probably borrowed his system of rhyme from Apollonius of Tyre, though similar rhymes had been used, sparingly, however, by the troubadours, as early as 1100. It seems probable, therefore, that it may have come into Spain from Provence. Berceo was the first to give it a permanent place in Spanish literature in 1230, where it still survived at the end of the 14th century. Though of no great reach of imagination Berceo, by the carefulness of his rhymes, the beauty of his versification and the general harmony of his language at such an early age in the history of the Spanish tongue, has placed the literature of his country under deep obligation to him. He expresses the spirit that inspired him, in 'The Life of Santo Domingo,' which is the opening poem of his published works, when he says: "I intend to tell a story in the plain Romance, in which the common man is accustomed to converse with his neighbors." This choice of the vernacular was fortunate for the popularity of Berceo, and doubly

fortunate for the popular speech which had already begun to show its possibilities. Consult Ticknor, G., 'History of Spanish Literature' (New York 1854); Wolf, F., 'Ueber die Lais' (Wien 1841); or any good work on Spanish literature.

JOHN HUBERT CORNYN.

**GOOBER, or GOUBER.** See PEANUT.

**GOOCH, Sir Daniel**, English engineer: b. Bedlington, England, 24 Aug. 1816; d. Clewer Park, Berkshire, 15 Oct. 1889. Besides inventing various improvements in the building of locomotives, he was active in furthering the laying of the first transatlantic cable, on the completion of which he was created a baronet. He sat in Parliament 1865-85. He was one of the superintendents of the Great Western Railway 1837-64, and chairman of the company from 1865 until his death.

**GOOCH, Frank Austin**, American chemist: b. Watertown, Mass., 2 May 1852. He was educated at Harvard and was assistant in the chemical laboratory there, 1872-75. He was subsequently chemist on the Northern Transcontinental Survey and United States Geological Survey, 1878-86, and has been professor of chemistry at Yale from 1886. His publications include 'Analyses of Waters of the Yellowstone Park,' with J. E. Whitfield (1888); 'Research Papers from the Kent Chemical Laboratory of Yale University' (2 vols., 1901); 'Outlines of Inorganic Chemistry,' with C. F. Walker (1905); 'Laboratory Experiments with C. F. Walker' (1905); 'Outlines of Qualitative Chemical Analysis,' with P. E. Browning (1906); 'Methods in Chemical Analysis' (1912); 'Representative Procedures in Quantitative Chemical Analysis' (1915). He also contributed to Rumpely's 'Mining Industries of the United States' (10th census, 1886), and to 'Explorations in Turkestan' (Carnegie Institution Report 1908); and research papers to the *American Journal of Science*, the *Zeitschrift Anorganische Chemie* and other journals.

**GOOCH, Sir William**, English colonial administrator: b. Yarmouth, 21 Oct. 1681; d. London, 17 Dec. 1751. He was a soldier of Marlborough in the Netherlands, and was governor of Virginia from 1727 to 1747. In 1740 he accompanied Vernon's expedition against Cartagena, and in 1749, after a generally excellent and successful administration, returned to England and was created a baronet. During his term of office he opposed religious toleration to religious organizations other than the Establishment.

**GOOD, James Isaac**, American (German) Reformed clergyman: b. York, Pa., 31 Dec. 1850. He was graduated from Lafayette College, Easton, Pa., in 1872; entered the Reformed ministry and has been successively pastor of Heidelberg Reformed Church, York, Pa., 1875-77; Heidelberg Reformed Church, Philadelphia, 1877-90, and Calvary Reformed Church, Reading, Pa., 1890-93. From 1893 to 1907 he was professor of dogmatics at Ursinus College, and professor of liturgics in Central Theological Seminary Dayton, Ohio, since 1907. He has published 'Origin of the Reformed Church of Germany' (1887); 'History of the Reformed Church of Germany' (1894); 'Rambles Round Reformed Lands' (1889); 'History

of the Reformed Church in the United States' (1899); 'History of the Reformed Church in the United States in the Nineteenth Century' (1911); 'History of the Reformed Church of Switzerland since the Reformation' (1913); also 'Famous Women of the Reformed Church' (1901); 'Famous Missionaries of the Reformed Church' (1903); 'Famous Places of the Reformed Churches' (1910); 'The Heidelberg Catechism in its Newest Light' (1914).

**GOOD, John Mason**, English physician and author: b. Epping, Essex, 25 May 1764; d. Shepperton, Middlesex, 2 Jan. 1827. In 1793 he removed to London, where he carried on business for several years as a surgeon and apothecary, and after 1820 practised as a physician. His principal works are 'Memoirs of the Life and Writings of Dr. Alexander Geddes' (1803); translations of Solomon's Song and the Book of Job; a translation of Lucretius 'On the Nature of Things' (1805); 'Medical Technology' (1810); 'A Physiological System of Nosology' (1817); 'The Study of Medicine' (1822), and 'The Book of Nature' (1826).

**GOOD COUSINS**, the name by which the members of the Carbonari Society were known among themselves in Germany and France. The society of the charcoal-burners (Carbonari) is undoubtedly one of the oldest in Europe. Some writers on the subject have claimed that its originator was Philip of Macedon, father of Alexander the Great, while others trace its origin to the union of charcoal-burners in Germany in the 12th century for self-protection against soldiers, robbers and other enemies. By the 16th century the secret society of the charcoal-burners was strong enough to force Ulrich, Duke of Württemberg, to abolish certain oppressive forest laws. These societies, which, in their mystical rituals, exhibited a curious mingling of Christianity and paganism, spread rapidly throughout the wide forest areas of Germany, France and adjacent countries, where their secrecy and their faithfulness to the obligations of their secret society oath became the highest symbol of faithfulness. In Italy, it was customary to affirm anything strongly by asserting that the statement or promise was made "on the faith of a Carbonaro." Political plotters in various countries took refuge in the forest, and there, to disarm suspicion, assumed the rôle and life of charcoal burners and venders. This enabled them to go into the cities and towns and the strongholds of their enemies and there to spy out the land and meet with other plotters. Thus the Carbonari frequently played their part in the troublesome politics of Europe, extending their sway and their methods as far as Ireland and Scotland; and everywhere the Carbonari were known to one another by an elaborate series of ritualistic signs, international in their import and interpretation. This ritualistic organization seems to have been the result of the combination of the wood-cutters and charcoal-burners societies upon which was grafted a ritual formed, in part at least, by the political refugees and plotters, who succeeded in giving the association a world-wide importance, mystic significance and executive organization it could scarcely otherwise have had. Francis I of France plays a prominent part in the traditions of the Carbonari, at whose feasts the grand master of

the order drinks his health, as its founder. The tradition runs that the king, while out hunting, got lost in the forest. There he was entertained by the charcoal burners and initiated into their secret order, in which he afterward took a great interest, elaborating the ritual into which he introduced a deep symbolism. In this tradition there is probably a shadowy remembrance of the fact that Francis I extended his protection to the Waldenses, many of them forest people, who had taken refuge in his kingdom. One of the traditional leaders of the Carbonari (who seems to have been a historical character) was Theobald, a hermit of noble rank who lived in the forest of Suabia; and he is said to have become the patron (during his life) and adviser of the charcoal-burners. He was canonized by Pope Alexander III in the 12th century and adopted by the Carbonari as their patron saint. The deeds attributed to him are a curious commingling of pagan and Christian traditions which are reflected in the ritualistic hymns which the Carbonari address to him, invoking his aid as the chief good cousin of all the "Good Cousins." This ritualistic term which has long been employed by the members of the Carbonari to designate one another seems to have been first employed by the wood-cutters of the department of Jura (France) who termed their secret society "le bon coucinage" (the good cousinship), a name adopted by the Carbonari and applied also to the individual members of the association, the first and second degrees of which were termed, respectively, that of the *Fendeurs* (wood-cutters), and that of the Carbonari (coal-burners). In the pre-revolutionary days of France (1770-89) many of the members of the French Chambers and of other associations tinged with Republicanism were members of the *Fendeurs*, of which there were secret societies in most of the great centres of population in France, including the capital itself. The Good Cousins societies, which afterward became too strong in southern Italy, were introduced into that country by returning soldiers who had taken part in the Napoleonic wars, or by exiles who had lived in Germany and Switzerland during the occupation of Italy by the French. The lodge or meeting-house of the Carbonari was known as the *vendita*; and the decrees of the society were popularly represented as those of the *vendita*. The first lodge or *vendita* of the Carbonari in Italy, of a formal character, was opened in Capua under the protection and auspices of the British, who wished to use the association as a means of uniting the Italians, in secret societies, against Napoleon. The order, thus encouraged, spread rapidly, became much better organized and played a prominent part in the political wars and revolutionary movements of Italy. See CARBONARI.

JOHN HUBERT CORNYN.

**GOOD FRIDAY** (God's Friday), the name applied by the Church of England to the Friday before Easter, sacred as commemorating the crucifixion of our Lord; the Great and Holy Parasceve is the Greek title of it, and it is called in the Roman Missal the Parasceve. This day was kept as a day of mourning, of rigid fast and of special prayer from a very early period. Eusebius (200 A.D.) says that the day had been observed long before his time. Constantine ordered a cessation from all labor on that day. It was one of the two paschal days celebrated by the Christian Church, and in memory of the crucifixion was called by the Greeks *Pascha Staurosimon* or the "Pasch of the Cross." In the Roman Catholic Church the service of this day consists of what is called the Mass of the Presanctified, the sacred host not being consecrated on Good Friday, but reserved from the preceding day. Communion is forbidden on Good Friday, except in the case of the celebrant and of sick persons.

The most striking part of the ceremonial is the "adoration of the cross," or, as it was called in the Old English popular vocabulary, "creeping to the cross." The black covering is removed from a large crucifix which is placed before the altar, and the entire congregation, commencing with the celebrant priest and his ministers, approach, and on their knees reverently kiss the figure of our crucified Lord. The very striking office of *Tenebræ* (darkness) is performed on Good Friday, as well as on the preceding two days: it consists of the matins and lauds of the following day, and has this peculiarity, that by the close all the lights in the church have been gradually extinguished except one, which for a time (as a symbol of our Lord's death and burial) is hidden at the Epistle corner of the altar.

In the Church of England, and in the Protestant Episcopal Church of the United States, as well as in the Roman Catholic Church, Good Friday is celebrated with special solemnity: proper psalms are appointed, and one of the three special collects is a prayer for "all Jews, Turks, infidels and heretics." In some churches of the English Church, and of the Protestant Episcopal Church, the *improperia*, or reproaches, adopted from the Roman service, are sung; and Bach's passion music is frequently heard. The 'Three Hours' Devotion,' borrowed from Roman usage, with meditation on the 'seven last words' from the Cross, and held from 12 till 3, when our Lord hung on the Cross, is a service of Good Friday that meets with increasing acceptance among the Anglicans. In England and Ireland Good Friday is by law a *dies non*, and all business is suspended; but this is not the case in Scotland or the United States. In Scotland the day till recently met with no

peculiar attention, except from members of the Episcopal and Roman Catholic communions; but of late years services have been held in many Presbyterian churches, and there is a growing disposition to fall in with the rest of Christendom in the observance of this day.

**GOOD HOPE, Cape of.** See CAPE OF GOOD HOPE.

**GOOD ROADS MOVEMENT, The.** The country road is coming into its own in the recent and current "good roads movement." The importance of the rural highways of the nation has been long neglected, in comparison especially with the railroad. Canals and waterways—the other great natural means of transportation—have been likewise neglected. The American attitude toward transportation thus practically reverses the European way of regarding the problems; for in the leading continental countries, the highways and waterways are the principal means of transport and are regarded as such. This is due to the conditions of our national development, and the time now seems ripe for a continued interest in the completion of a highway system, and a renewed interest in canals, in order to supplement and render adequate to its special function the vast system of railroads that has been created.

In the first beginnings of our westward expansion roads occupied an important place, but for a while, in the early decades of the last century, were superseded by canals and waterways, as the principal trunk lines of transportation to the opening West. However, the outstanding fact that the river systems were separated by important geographic features, together with the need for more direct and rapid transit, made road-building still important. The "railroad" coming into practice about 1830 was really but a greatly modified road, and a supplement to the existing waterway system. But from its beginning it came rapidly to supersede all other means of long-distance transport, and has continued its growth and importance in the focus of interest, to the present. The decline of the waterways was very rapid and almost complete, until the very recent awakening of interest in them, as one phase of the conservation of national resources (1908). Roads became a merely local matter—mere feeders for the greatly growing railroad system—the decline of local markets, the centralization of industry and commerce in the great centres, and the urgent need for opening of new roads, all combined to give the highways a secondary place in the national transportation problem.

Within the last 75 years, however, the Good Roads Movement has brought the highway to a place of first-rate importance. It constitutes undoubtedly one of—if not *the*—most important chapters in rural progress of the last generation. This is indicated by the fact that in the proceedings of the Country Life Commission (1908), throughout its tour of investigation in every part of the United States, the matter of "good roads" was a universal and constant topic of discussion. Within the last 10 years too, State activities in relation to highways has become one of the largest expenditures of the State governments, ranking next after education, charities and corrections, and at times even superseding these in importance.

The discovery and use of new and distinct sources of State revenues would seem to guarantee the continuance of this activity. Moreover, the new administrative arrangements under which State aid and control are carried on constitute one of the principal forms of governmental centralization in recent years.

The general strength of the movements may be judged from the following current figures: The rural public roads of the United States at the present time (1918) have a total length of 2,456,000 miles (nearly tenfold the railway mileage). Of this immense total, constituting our achievement in road-building as a nation, to date, already some 12 per cent, or 300,000 miles, are "improved" with some sort of hard surfacing. This is practically all the result of the activities associated with the Good Roads Movement since 1890.

Thus viewed the movement seems scarcely begun, and the immensity of the task of improvement appalling. But it must be remembered that at least half of this enormous mileage of pioneer highways consists of roads that are but little used and quite unnecessary. These may with advantage be closed and hence require no improvement. "Relocation" will also in a vast number of cases much reduce the distance, lessen grades and otherwise reduce the problem of good roads for the nation to the limits of a measurable task.

During recent years the total mileage of all roads has remained practically stationary, but the total mileage of surfaced roads has increased at the rate of about 15,000 miles per annum. The pioneering work of opening new roads has thus been accomplished; the problems of the present and immediate future are those of maintenance, improvement, relocation and administrative control.

The year 1917 naturally showed a decrease of 5,000 miles from the average rate, due primarily to war conditions, such as scarcity and high price of labor and materials. The increase in the cost of road work is conservatively estimated at 50 per cent, so that the continuance of the movement even at the present reduced rate is indicative of its strength and perseverance.

For the years from 1904 to 1916 the expenditures averaged an annual increase of 12 per cent. And practically every legislative session sees some new and important highway measure enacted, creating new departments and extending the powers of those already existent.

From the beginning of the present movement to good roads the total State expenditures, under State laws and State administration, have amounted to about one-third billion of dollars (\$307,937,833). The rapid increase of this phase is seen in the growing importance of the State funds both in absolute amount from year to year, and relatively to the amount of local expenditure. The State aid of 1904 was \$2,549,912; of 1913, \$37,438,172; and of 1916, \$40,969,001. Thus at present approximately 13 per cent of the expenditures on the highways of the country come from the State treasuries.

While at present there is still some \$15,000,000 annually expended in the form of "convict labor" and "statute labor," this element seems liable to grow less and the measure of road improvement to be the amount of cash expenditure for skilled labor and direction.

It must not be thought, however, that State activity constitutes the Good Roads Movement. Its total volume is as yet relatively small, though concentrated and consequently more spectacular and noteworthy. Its truer measure of importance is the degree to which it constitutes a pace-maker for new ideas and policies in road work. The State and State-aided roads are practically model-roads, and not the least of the influence of the State highway departments has been their advisory and informational activities. The multitudinous local improvements, too, of the districts, townships and counties on their own initiative and responsibility constitute in total a vast volume of road betterment.

Nor can private enterprise and efforts be neglected in appraising the total movement. The great new automobile trunk lines, stretching between all the great cities, and even connecting coast with coast, are of first-rate importance, and constitute indeed the most noteworthy examples of road-improvement in the country. These, with the many minor through-roads which have resulted from the mapping of routes, associated with State and nationwide touring, are most important, yet do not come within the scope of the data given.

Transportation has been from the beginning one of the principal problems of our national life and it has been dealt with energetically and with largeness of vision at every stage. The existing network of highways, canals and railroads flung across the continent in a century, however imperfect in detail and co-ordination, is a marvelous achievement. Similar large ideas and strenuous efforts are now being put into the Good Roads Movement. The countries of Europe, with whose highways we are accustomed to compare ours, have had no such conditions or needs to face. The history of the Good Roads Movement, more especially of recent years, is ample evidence that American road-builders can crown the work of the last century, with a couple of decades of rapid progress toward perfect highways.

For although what is technically known as State aid, and the Good Roads Movement, is not really new, it had its latter day origin in 1891 in New Jersey. Kentucky had early in the last century appropriated as a State money for the support of certain toll roads, and New Hampshire had also extended State aid for certain specified roads, but no co-operative plan between States and their subdivisions (counties, towns, townships) had been thought of, nor did any such appear until the date mentioned.

Prior to 1800 there were few roads in the country that deserved to be characterized as "improved." In 1796 there was but one turnpike on the continent, 66 miles between Lancaster and Philadelphia, built by a private company, and hardly conforming to our ideas of a macadam road. Another noteworthy early "turnpike" (so-called from the revolving beam that obstructed the passage at the toll-gates) was the "Wilderness Road" from the Shenandoah Valley in Virginia westward to Kentucky, and still operated in 1895 by the Wilderness Turnpike Company. To supplement such private ventures, many attempts were made to secure road contributions from the National government in the early days of the Constitution, but the only road of importance so

financed was the Cumberland road, largely macadam, stretching for 800 miles from Cumberland, Md., to Vandalia, Ill.

The construction of macadam roads in those days was well-nigh prohibitive from the cost and "corduroy" (log-surfaced roads) were often built, across wet and soft stretches. These became very common and with the advent of the saw-mill were supplemented by "plank-roads," particularly for the "toll" roads. These were a great improvement over the corduroy, cheaper than the macadam to construct, but expensive in maintenance. But over such highways, aided by the rivers, canals and the beginnings of the railroad system, the great westward pioneering movement took place. Then after the wave of internal improvements had swept over the various States in the years from 1835 to 1840, road construction gradually became a local matter, except where turnpike companies continued to build stretches of toll-roads. Even for these, the advent of the railroad lessened the need. Henceforth, little private or public money was expended upon the roads; "working out the road tax" became the common method of opening and maintaining highways. Poor roads were the inevitable result and this general situation continued till long after the Civil War. Then, the rise of cities, and the beginnings of better paved streets, made glaring the contrast with the awful condition of the heavily traveled roads in the vicinity of the great cities. The agitation for better roads grew rapidly and assumed the importance of a "movement" from 1890 on, especially in the long settled and highly urban States of the East.

The widespread use of the bicycle and in more recent years of the automobile has given great impetus to the movement. In 1916 there were 3,500,000 registered automobiles—the number having doubled since 1914—making a total of \$25,000,000 available from registration and license fees, of which some \$16,000,000 was under State control, and about \$8,000,000 subject to the local governments. This amount constitutes almost one-half of the total annual expenditure for roads by the State governments, and is a good example of the important place the coming of the automobile plays in road improvement. The bicycle had preceded the automobile. By 1899 the "craze" was at its height, and over 1,000,000 wheels were turned out in that year. But by 1904 the interest had so fallen that the product fell to one-sixth of its former volume, and has since remained stationary. It had, however, done its work for the Good Roads Movement. The rural problem became a very conscious one also, in this last decade of the century, and gave a new meaning to every movement for the betterment of agricultural industry and country life.

The movement, too, has been greatly furthered by the progressive development of road machinery. For the use of broken stone on road surfaces depended very largely upon the development and use of road rollers and stone-crushers. Most noteworthy and epoch making of all, however, in its widespread effect upon roads in all parts of the country, was the appearance of the "King Drag."

State action may very well be taken to mark the rise and development of the Good Roads Movement and its progress may be conveniently

chronicled by the order in which the various States have so acted. Their dates are as follows: New Jersey, 1892; Massachusetts, 1893; Vermont, 1894; Connecticut and California, 1895; New York and Maryland, 1898; Maine and North Carolina, 1901; Rhode Island, 1902; Pennsylvania, New Hampshire and Delaware, 1903; Ohio and Iowa, 1904; Illinois, Minnesota, Michigan, Idaho and Washington, 1905; Virginia, 1906; Missouri, 1907; Georgia, 1908 (but still provides for convict labor only); Arizona, Colorado, New Mexico, North Dakota, Utah, West Virginia, 1909; Louisiana, 1910; Alabama, Kansas, Nebraska, Oklahoma, Nevada, South Dakota, Wisconsin, Wyoming, 1911; Kentucky, 1912; Arkansas, Montana and Oregon, 1913; Florida, Tennessee and Mississippi, 1915. Indiana, South Carolina and Texas have as yet taken no action.

Naturally the particular form and measure of action taken by these different States differs widely and it is perhaps unfair to so list them, except as a general indication of the scope and direction of the Good Roads Movement. But the general model was early set and although there have from time to time been new features added and new policies entered upon, the movement has been progressive and cumulative and is now well established in all its essential features.

In 1889 a general county-road law was passed by the New Jersey legislature, permitting counties to issue bonds for broken stone or hard road construction, and to assess one-third of the cost upon property abutting. Two years later she passed a State Aid or State Highway Law (re-enacted 1892) which was the *beginning of systematic road improvement in the United States*, under the direction of State officials and with the aid of State funds. Before the close of that year the State paid some \$20,000 to Middlesex County to help meet the cost of about 10 miles of broken stone road in the vicinity of Brunswick and Plainfield. Thus was begun the Good Roads Movement of recent years.

In 1894 the official State commissioner of public roads took the place of the president of the State Board of Agriculture, who had ex-officio acted for the State. The movement was thus fairly launched with the following general policy: Under the original act the State paid 33.3 per cent, abutting property owners 10 per cent, and the counties the remainder. The initiative was with the property owners.

Soon the demand for trunk-line improvements led to the establishment of a continuous system of State roads. The cost of improvement and maintenance of these was borne entirely by the State, and all work planned and supervised by the State Highway Department. Also certain county-roads were improved by State aid, the State paying 40 per cent of the cost, if the improvement was approved by the State commission. But these roads are maintained by the counties. The funds for State aid included appropriations from the legislature and receipts from motor-vehicle licenses and fines. From such sources to the end of 1915 New Jersey had expended about \$8,500,000 for road improvements. The Good Roads Movement then began under especially favorable conditions and acquired powerful initial impetus.

Massachusetts, with the same general conditions, became active in the movement about the same time. As result of a legislative committee of investigation, a State Highway Commission was established in 1893, and the first appropriation made next year. The system is more highly centralized than in New Jersey. Roads are improved by the State on petition of the local authorities, the State paying 75 per cent and the county 25 per cent. Also a certain sum is set aside each year for the direct assistance of the smaller and poorer towns.

The Massachusetts law has particular merit in being more explicit in regard to *maintenance* than are State highway laws in general, even those of later date. Of the funds derived from motor vehicle licenses 80 per cent *must* be expended for maintenance, and special appropriations are made each year for this same purpose. Also, the counties refund 25 per cent of the sums expended by the State for maintenance of State roads within their boundaries.

The funds in this State are derived from State *bond issues*, usually running five years, one-fifth being issued each year. This system of financing has enabled this State to become a leader in expenditures for road improvements, the amount to the end of 1915 being nearly \$20,000,000. New York adopted State aid in 1898, but has since become the leading exponent of the system. After various changes in the scheme of organization the work was placed in charge of a single State Highway Commissioner who appoints three deputy commissioners. In their charge there are four classes of roads: (1) State roads, improved and maintained wholly by the State; (2) county roads, improved and maintained jointly by the State, county and town; (3) country roads, improved and maintained wholly by the counties; (4) town roads, improved and maintained by the towns, assisted by the State. All classes of roads are thus assisted and very large expenditures are thus called for. New York leads in amounts expended. A bond issue of \$50,000,000 was authorized in 1906 for the improvement of a system of county roads (8,380 miles), to which was subsequently added a system of State roads comprising 3,617 miles. This is a landmark in the history of the Good Roads Movement and it was followed by another bond issue of \$50,000,000, authorized in 1912, of which \$20,000,000 was for construction and maintenance of State roads and \$30,000,000 for the completion of the county-highway system. The apportionment of the funds among the counties is on the basis of population, mileage of roads outside cities and villages, and the total area, each factor having a weight of one-third. The total sum expended by the State to the end of 1915 was about \$97,000,000, or nearly one-third of the total amount expended by all the States since the inception of the movement.

Ohio enacted State highway aid laws in 1904. A system of main market roads is improved and maintained jointly by the State and the counties; the county and town roads are improved and maintained by the local authorities, under State supervision. Under this arrangement the total amount of State aid to the end of 1915 has been about \$8,500,000.

Iowa entered the movement the same year and has, since 1904, a State Highway Commissioner. Road improvements are made by the

counties under State supervision and advice. Main roads, not exceeding 15 per cent of all roads in a county, are improved and maintained as county roads; all others are town roads. Conditions in Iowa call rather for care in maintenance through dragging than for construction, hence the total expenditure of State funds has not exceeded \$300,000 by end of 1915. This great agricultural State, with its large road mileage, and exceptional number of automobiles, thus ranks lowest of any of the important States, except Indiana, in the Good Roads Movement.

The expenditure of State funds for road improvement throughout the United States has proceeded in accordance with one or other of the methods outlined above. A commission, with an executive commissioner, or one of these, constitute the models for organization. The diversion of motor-vehicle fees to State road improvement is practically universal and represents the consensus of opinion that these are the principal, though not the sole factor, in occasioning the need and demand for good roads. The distinction between State roads and State-aid roads is quite common, while a large field for strictly local effort is generally left free. There is a strong tendency to financing by extension bond issues rather than by direct appropriation. Generally the action of the State goes beyond being merely informational and advisory.

But there is still much variety both in the manner of giving State aid and in the sums given. In California the advisory board of the State department of engineering has general supervision of road work and a subdivision of this board is the State Highway Commission. The State may assist in the improvement of any road of State importance, but under the act of 1910 a specific sum was provided for the improvement of a system of State roads, which in a general way is defined in the act. The system is thus constructed and maintained wholly by the State, but the counties refund a part of the cost in small yearly instalments. Funds are derived from bond issues and by special appropriations, amounting by the end of 1915 to about \$15,000,000. California thus ranks with the States which have entered largely into road building. She has special conditions in nearly every part of the State which render State aid peculiarly necessary and advisable. Other Pacific and Mountain States may likewise be expected to become foremost in State action because of similar conditions.

Missouri has established the office of State Highway Commissioner. There is a State stamp tax on certain documents, the proceeds of which are divided among the counties in proportion to the number of school children. Special appropriations are made for dragging roads. The amount of State aid to end of 1915 was about \$1,500,000.

Georgia has a law for utilizing convict labor on the roads but has no State Highway Department, nor does it otherwise take part in road improvement. Delaware has a State Highway Commissioner for one county only. Alabama has a State Highway Commission. Roads are improved jointly by the State and the counties, each paying one-half the cost, but to the end of 1915 the sum amounted to only one-half mil-

lion. Kansas gives no money for construction, but it has a State engineer, a part of whose duty it is to furnish plans, specifications and advice. Nebraska has a State Board of Irrigation, which gives assistance in highway bridge work and advice on road work. Oklahoma has a Highway Commissioner, whose duty it is to give advice, plans and specifications. Nevada has a State Engineer who has charge of the State-aid road work but no large appropriations have been made. South Dakota has a State Highway Commission, but merely advisory.

Wisconsin has a Chief Engineer of the State who has general supervision of road improvement. Selected county roads may be improved jointly by the State, county and town, each paying one-third the cost. Specifications and plans are furnished by the State Highway Department; the roads are maintained, however, by the counties. About \$4,000,000 of State aid funds had been expended to end of 1915.

In the beginning of the movement various experiments were tried, such as steel-tracked roadways, but time-approved methods of improvement soon became standard. For many parts of the country the ordinary dirt road is probably the only economical type. When surfaced with a proper mixture of sand and clay, or topsoil, kept smooth and hard by the frequent use of a "road drag," and well drained, it makes a very serviceable roadway throughout the year, with the possible exception of the early spring months. This type of road has been the object of considerable engineering study, especially in the States of the great central valley of the United States. About one-sixth of the total 30,000 miles of State-aid roads in 1915 were of this sand-clay type.

Nearly one-half the total come under the classification of "gravel roads," a grade better than the sand-clay. These can be built for \$2,500 to \$4,000 a mile, and the cost of maintaining them generally does not exceed \$250 a mile per year. Often these are built of bank-run gravel, but more generally a certain proportion of sand and clay or loam is mixed with the gravel to give the mixture the necessary binding qualities.

The best type of roads are, of course, the macadamized, similar to gravel roads, but with more binding. Instead of small pieces of stone in the form of pebbles and natural fragments, artificially produced fragments are used, and instead of sand and loam, rock dust is employed as the binding material. This broken stone is placed in layers and rolled with heavy steam road rollers. These roads, sprinkled with water before first rolling, are called "water-bound" macadam. Distinguished from it is the "bituminous macadam" in which asphaltic or tar binding material is used, either in place of, or in addition to, the rock dust. Also, many gravel and water-bound macadam roads, either immediately after completion or subsequently, are treated with a surface coating of liquid bituminous binder, sprinkled over with a layer of sand or stone chips. These are practically pavements.

Both gravel and water-bound macadam roads require ceaseless vigilance in maintenance and without this they rapidly go to pieces under motor vehicle traffic. The pneumatic tires of

motor vehicles appear to be very destructive, especially in dry weather, by drawing out the dust binding material and causing the surface to "ravel." Hence the vital importance of clauses in road laws relative to maintenance. To prevent this disintegration there is a great variety of materials, patented and unpatented, to be applied to road surfaces. These vary all the way from common salt and calcium chloride to the many bituminous compounds, e.g., Dustoline, Glutrine, Rocmac and numerous petroleum and tar products. These are all either "dust layers" or "road binders." Dust layers are intended to hold the dust in the road by keeping the surface damp (as in the case of salt and calcium chloride) or by the capillary attraction of an oily liquid. The road binders have such adhesive or cementive qualities as to replace the dust as a binder and keep the road surface intact.

Other phases of the good roads movement which are important are the relocation of roads; the elimination of grades, elimination of grade crossings, the closing of unnecessary or little used roads; the provision of proper drainage; legislation regarding wagon tires and weeds; the abolition of toll roads. In some States the movement has entered into the aesthetics of road improvement, beautifying the roads with trees, erecting sign posts at cross-roads, naming farms.

A new interest in the economics of road improvement has been a decided factor in the movement. It is now realized that the first cost is high but the resultant gain great, because of the increased volume of traffic on them. Nearly 100,000,000,000 pounds of farm products are annually hauled from farms to shipping points and to this must be added the enormous weight of products hauled from farms to mills and from mills back to farms; as well as the truck, forest and mine products, and the city products that go out into the country. The average cost of hauling per ton mile is about 25 cents, which foreign experience as well as government investigations have shown could be reduced to at least 12 cents or 50 per cent, making a possible saving of over \$50,000,000 or about the amount now annually expended in direct State aid. The Good Roads Association was formed in 1892 and immediately resulted in increased interest. The separate States have also formed good roads associations, and the meetings and reports of these and the national association play an important part in disseminating information and arousing interest. The extension of rural mail service has been of some effect upon improvement of roads. In 1917 about 500,000 miles of roads were described and used as post routes. Indeed every phase of rural betterment calls for better roads. The movements to the centralization and consolidation of schools is closely connected with the condition of the roads.

The Office of Public Roads, United States Department of Agriculture, was established in 1893 by an appropriation of \$10,000 for the purpose of making inquiries in regard to systems of road management, methods of road making and to publish and distribute information on these subjects. This bureau has been steadily increasing in importance. It has a well-equipped laboratory for testing rocks and

other road materials and its staff of engineers supervises the construction of experimental and model roads in various parts of the country, and gives advice to local road authorities. Down to date it has directed the construction of some 150 object-lesson roads in 35 States. In 1915 this bureau and others were consolidated under the name of the office of public roads and rural engineering.

Very recently direct Federal aid has been extended. The Secretary of Agriculture announces the apportionment of \$14,550,000 of Federal funds to be used for the fiscal year ending June 1919 by the several States in the construction and maintenance of rural post roads. This is the third apportionment under the Federal State Aid Act (1916), \$4,850,000 having been appropriated for 1917 and \$9,700,000 for 1918. The amounts available for the various States range from \$749,674 for New York, to \$24,411 for Delaware. This act has had a favorable effect on the increasing amount of expenditure for roads, for it requires that before a State can avail itself of the benefits of the act it shall have a State Highway Department, and that the State or subdivisions shall meet the Federal aid dollar for dollar. All the States are now qualified to receive Federal aid, but five States (Georgia, Kansas, Mississippi, North Carolina and South Carolina) have made no expenditures. By June 1917 there was about one-tenth (11.6 per cent) of the public roads surfaced. Of the total of such (284,047 miles) 69,186 miles had been all-State or State-aid roads. Also 16,160 miles of such State roads had been built in 1916 and 75,311 miles had been maintained with State aid in that year. State aid also built 4,490 bridges. The State funds available for 1917 amounted to over \$60,000,000. There were thus vast sums available and expended, \$40,969,001 of State aid funds; \$33,526,553 of local moneys, a total of \$74,495,554. Of this \$44,469,824 was expended for construction of roads, \$5,414,331 for bridge building, while maintenance of roads and bridges called for \$18,452,861.

WILLIAM L. BAILEY,  
*Grinnell College, Grinnell, Iowa.*

**GOOD TEMPLARS**, a temperance society which combines the principles of teetotalism with certain mystic rites, imitated less or more from freemasonry, having secret signs, passwords and insignia peculiar to itself. It originated in Utica, N. Y., where it was organized by Daniel Cady and others, in 1851, and extended to England in 1868. There is no restriction placed on membership on account of color, age or sex. The organization consists of local "subordinate" lodges, county "district" lodges, national "grand" lodges and an international "supreme" lodge. A "juvenile order" is also attached, and the Templars have founded an orphanage at Sunbury, near London, at a cost of \$50,000. The Prohibition party was formed in 1869 by a committee appointed by the Right Worthy Grand Lodge, the then highest governing body of the order. In 1874 Good Templar women founded the Women's Christian Temperance Union. The order maintains the Washingtonian Home for Inebriates at Chicago, Ill., and an orphans' home at Vallajo, Cal. It has no beneficiary system. Its platform consists of total abstinence from all in-

toxicating liquors as a beverage, no license, but prohibition of manufacture and sale, and the election of men who will enforce the liquor laws. The motto of the order is 'Faith, Hope and Charity.' It is an outgrowth of the Sons of Temperance. The recent reports of the international secretary returned the number of grand lodges as 70 and the membership in both adult and juvenile branches, 620,000. There are grand lodges in nearly all States of the Union, in England, Ireland, Scotland, Wales, Denmark, Germany, Sweden, Norway, Switzerland, Hungary, Rumania, Holland, Canada, the West Indies, South Africa, Australia, New Zealand, British India, Iceland and other countries.

**GOOD-WILL**, the benefit derived from a business beyond the mere value of the capital, stock, funds or property employed in it, in consequence of the general public patronage and encouragement which it receives from constant and habitual customers. It is legally considered a subject of sale along with the stock, premises, fixtures, trade debts, etc. It is usual for the seller to enter into an express covenant not to carry on a business of the same kind at some specified moderate distance from the place where the purchaser resides, and if he breaks the covenant he is liable to an action for damages. In most of the States of the Union the purchaser of goodwill can only cut the seller off from soliciting old customers of the business surrendered and from otherwise attempting to supplant the new tenant in popular favor, by securing a written contract.

**GOODALE, Dora Read**, American poet: b. Mount Washington, Berkshire County, Mass., 29 Oct. 1866. With her older sister, Elaine Goodale (q.v.), she began to write verse in early childhood. Her poems, and those of her sister, appeared in magazines at that time and attracted much favorable notice. With her sister she published 'Apple Blossoms' (1878); 'In Berkshire with the Wild Flowers' (1879); 'All Round the Year' (1880), and 'Verses from Sky Farm' (1880).

**GOODALE, Elaine** (Mrs. Eastman), American poet: b. Mount Washington, Mass., 9 Oct. 1863. In June 1891, she was married to Charles A. Eastman, M.D., an educated Sioux Indian. At an early age she began to write verse and with her sister Dora (q.v.) published 'Apple Blossoms: Verses of Two Children' (1878); 'In Berkshire with the Wild Flowers' (1879); 'Verses From Sky Farm' (1880). She was sole author of 'Journal of a Farmer's Daughter' (1881); 'Little Brother of Dreams' (1910); 'Yellow Star' (1911); 'Wigwam Evenings' (1909), also contributions to newspapers and magazines of articles on Indian life and character and the education of the Indian; also stories, poems and articles on child culture. She taught for some time in the Hampton Institute in Virginia, and edited the *Southern Workman* (1883). In 1885 she visited the Great Sioux reservation, and subsequently taught school at White River Camp, Lower Brulé Agency, Dakota. She afterward became supervisor of Indian schools, retaining this position until 1891.

**GOODALE, George Lincoln**, American botanist: b. Saco, Me., 3 Aug. 1839. He was graduated from Amherst College in 1860 and

has been instructor and professor of botany at Harvard from 1872. He has published 'Concerning a Few Common Plants' (1879); 'Physiological Botany' (1885); 'Wild Flowers of America' (1886); 'Useful Plants of the Future.'

**GOODALL, Edward**, English line-engraver: b. Leeds, 17 Sept. 1795; d. London, 11 April 1870. He was self-taught, and early in his career attracted the notice of Turner, a number of whose pictures he engraved. He also engraved many plates for the annuals.

**GOODALL, Frederick**, English painter: son of Edward Goodall (q.v.); b. London, 17 Sept. 1822; d. London, 29 July 1904. At 17 years of age he began to exhibit and he has produced some pictures of high excellence. He was elected to the Royal Academy in 1863. Among important works of his are 'Raising the Maypole in the Olden Time' (1851); 'Cranmer at the Traitors' Gate' (1856); 'The Subsiding of the Nile' (1873); 'Andromeda' (1887); 'The Thames from Windsor Castle' (1890); 'Isles of Loch Lomond' (1891); 'The Palm Grove' (1894).

**GOODELL, Henry Hill**, American educator: b. Constantinople, Turkey, 20 May 1839; d. at sea, 23 April 1905. He was graduated from Amherst College in 1862; was in the Union army in 1862-63; professor in the Massachusetts Agricultural State College in 1867-86, and in 1886 became its president. For several years he was chairman of the executive committee of the Association of American Agricultural Colleges and Experiment Stations, and in that capacity did much to further the interests of agricultural education.

**GOODELL, William**, American missionary: b. Templeton, Mass., 14 Feb. 1792; d. Philadelphia, 18 Feb. 1867. He was graduated from Dartmouth College in 1817, and from the Andover Theological Seminary in 1820; was ordained to the Congregational ministry in 1822, and in the same year went to Syria as a missionary. In 1823 he assisted in the establishment of the mission-station at Beirut, in 1823-28 was active there, in 1828-31 at Malta, in 1831-65 at Constantinople. Among his most important works was the preparation of a translation of the Bible into Armeno-Turkish.

**GOODELL, William**, American abolitionist: b. Coventry, N. Y., 1792; d. 1878. He was in business at different times in Providence, Alexandria, Va., and New York; in 1827 began at Providence the publication of the *Investigator*, and later was editor of a series of abolition periodicals, including the *Friend of Man*, official mouthpiece of the New York Anti-slavery Society; the *Radical Abolitionist*, and the *Principia*. His published volumes include 'Views of American Constitutional Law' (1844); 'The Democracy of Christianity' (1851); 'Slavery and Anti-slavery' (1852); 'The American Slave Code' (1853).

**GOODKNIGHT, James Lincoln**, American educator: b. Allen County, Ky., 24 Aug. 1846; d. 2 Oct. 1914. He was graduated from Cumberland University (Lebanon, Tenn.) in 1871, from the Union Theological Seminary in 1879, studied also at Edinburgh and Jena, and was president of West Virginia University (Morgantown). From 1900 to 1904 he was

president of Lincoln (Ill.) University, business manager of the Courier Company (of newspapers) (1904-11). His articles have appeared in various periodicals.

**GOODLAND**, Kans., county-seat of Sherman County; on the Chicago, Rock Island and Pacific Railroad. The manufactures are flour and machinery. The city contains railroad repair-shops and grain elevators, and is the centre of trade for a large agricultural region in which there are a number of cattle ranches. Pop. 1,933.

**GOODNOW**, **Frank Johnson**, American legal scholar: b. Brooklyn, N. Y., 18 Jan. 1859. He was graduated from Amherst College in 1879, from the Columbia Law School in 1882, studied also at the Paris Ecole Libre des Sciences Politiques and Berlin University, and was appointed to the chair of administrative law at Columbia in 1883. He became adjunct professor in 1887, and full professor in 1891. He was a member of the Public Ownership Commission to investigate municipal ownership in Europe in 1906-07, and in 1913-14 was legal adviser to the Chinese government, and since 1914 president of Johns Hopkins University. A recognized authority on municipal, administrative and constitutional law, he published 'Municipal Home Rule' (1890); 'Comparative Administrative Law' (1893); 'Municipal Problems' (1897); 'Politics and Administration' (1900); 'City Government in the United States' (1905); 'Principles of the Administrative Laws of the United States' (1905); 'Municipal Government' (1910); 'Social Reform and the Constitution' (1911), and is editor of 'Selected Cases on the Law of Taxation' (1905); 'Selected Cases on Government and Administration' (1906); 'Selected Cases on the Law of Officers' (1906).

**GOODRICH**, **Alfred John**, American writer on musical subjects: b. Chilo, Ohio, 1847. Largely self-taught, he was professor of musical theory in several institutions, and from 1899 directed his attention wholly to writing and private instruction. 'Music as a Language' (1880); 'Complete Musical Analysis' (1889); 'Analytical Harmony' (1894); 'The Theory of Interpretation' (1898), and 'Synthetic Counterpoint' (1903), are among his books and essays.

**GOODRICH**, **Charles Augustus**, American Congregational clergyman: b. Ridgefield, Conn., 1790; d. Hartford, Conn., 4 Jan. 1862. He was graduated at Yale in 1812 and held pastorates of Congregational churches in Worcester, Mass., 1816-20, Berlin, Conn., 1820-48 and Hartford, Conn., from 1848. He published 'Lives of the Singers' (1829); 'History of the United States' (1852-55); 'Universal Traveler,' etc. He was a brother of S. G. Goodrich (q.v.).

**GOODRICH**, **Chauncey Allen**, American clergyman and lexicographer: b. New Haven, Conn., 23 Oct. 1790; d. there, 25 Feb. 1860. He was graduated at Yale College in 1810, and was tutor there 1812-14. After a course of theological study he entered the ministry and was pastor of a Congregational church in Middletown, Conn., 1816-17; was elected professor of rhetoric and oratory in Yale 1817-39, and became professor of pastoral theology

in the theological department of the college in 1839. While tutor he published in 1814 a Greek grammar, translated chiefly from the grammar of Hachenberg. This he subsequently revised and enlarged, and published under his own name. It was often reprinted, and for many years was extensively used. About 1832 he published 'Latin Lessons' and 'Greek Lessons,' in which the precepts of grammar are throughout accompanied by practical exercises—a method subsequently applied by Ollendorff to modern languages. In 1828 Noah Webster (his father-in-law) entrusted to him the superintendence of the octavo abridgment of his large dictionary, by J. E. Worcester, with discretionary power to conform the orthography more nearly to the common standard. After several years of labor, he published in 1847 greatly enlarged and improved editions of the 4to and 8vo dictionaries of Dr. Webster. In 1856 he published in 8vo the university edition of Webster's dictionary, and in 1859 a new issue of the unabridged 4to dictionary.

**GOODRICH**, **Frank Boot** (Dick Tinto), American writer: b. Boston, Mass., 14 Dec. 1826; d. Morristown, N. J., 1894. He first became known by his Paris letters to the New York Times. He was the author of 'Court of Napoleon: or, Society Under the First Empire' (1857); 'Women of Beauty and Heroism' (1859); 'World-Famous Women, from Semiramis to Eugénie' (1870), etc.

**GOODRICH**, **Samuel Griswold** (Peter Parley), American writer: b. Ridgefield, Conn., 19 Aug. 1793; d. New York, 9 May 1860. He began as a publisher in Hartford, and established himself in 1824 as a publisher in Boston. He edited there, from 1828 to 1842, *The Token*, an annual to which he contributed several tales and poems, and in which also appeared some of Hawthorne's 'Twice-Told Tales.' His famous Peter Parley series of popular and juvenile books was begun soon after his removal to Boston, and gradually extended to more than 116 volumes, comprising geographies, histories, travels, stories and various illustrations of the arts and sciences. The geniality of these, and the admirable manner in which the author enlisted the sympathies of children, procured for them an immense success, which led to the issue in England of some spurious books under the name of 'Peter Parley.' In 1837 he published a collection entitled 'The Outcast, and Other Poems'; and in 1838 an ethical and educational work entitled 'Fireside Education.' In 1841 appeared a selection from his various contributions to annuals and magazines under the name of 'Sketches from a Student's Window'; and in 1857 'Recollections of a Lifetime,' a most entertaining account of his own history and that of his contemporaries. 'Merry's Museum' and 'Parley's Magazine' were conducted by him from 1841 to 1854. Under Fillmore's presidency he acted as American consul at Paris, and published there in French a treatise on 'American Geography and History.' The last work from his pen was the 'Illustrated Natural History of the Animal Kingdom' (1859).

**GOODSELL**, **Daniel Ayres**, American Methodist Episcopal bishop: b. Newburgh,

N. Y., 5 Nov. 1840; d. 1909. Graduated from New York University (then the University of the City of New York) in 1859, he entered the Methodist ministry in the same year; in 1880-88 was literary editor of the *Christian Advocate* of New York, and in 1888 was elected bishop and became secretary of the Methodist board of education. He wrote 'Nature and Character at Granite Bay' (1901); 'The Things that Remain' (1904); 'Peter the Hermit' (in 'Men of the Kingdom Series,' 1906).

**GOODWIN, Maud Wilder**, American historical novelist: b. Ballston Spa, N. Y., 5 June 1856. She married Almon Goodwin in 1879. She has published 'The Colonial Cavalier'; 'The Head of a Hundred'; 'White Aprons: An Historical Romance'; 'Dolly Madison,' a biography; 'Historic New York' (1898); 'Sir Christopher'; 'Flint'; 'Four Roads to Paradise' (1904); 'Veronica Playfair,' etc.

**GOODWIN, Nat(haniel) C(arl)**, American actor: b. Boston, 25 July 1857. His first appearance was made in 'Law in New York,' at the Howard Athenæum, Boston, and subsequently he became known in burlesque and light comedy. Among the dramas which he has since presented are 'A Gilded Fool'; 'In Mizoura'; 'An American Citizen'; his chief success 'Nathan Hale'; and 'The Altar of Friendship.' He also essayed 'Shylock' in Shakespeare's 'Merchant of Venice.' In 1907 he toured in repertoire, in 1911 he played in vaudeville and in 1912-13 he made a great success, artistic and financial, as Fagin in the centenary production of 'Oliver Twist.'

**GOODWIN, William Watson**, American Greek scholar: b. Concord, Mass., 9 May 1831; d. 1912. He was graduated at Harvard College in 1851; and was Eliot professor of Greek there 1860-1901. He published 'Syntax of the Moods and Tenses of the Greek Verb'; 'Greek Grammar'; and a revised translation of 'Plutarch's Morals' (1871).

**GOODY**, a local name in the Southern States for a small bay fish (*Leiostomus xanthurus*), much liked as a pan-fish, and known also as 'lafayette' and about New York as 'spot.' It is one of the family *Sciaenidae* (see *DRUM-FISH*), has a deep, compressed body, bluish above and silvery below, with about 15 narrow, dark, wavy bands extending from the dorsal downward and forward to below lateral line; a round black humeral spot rather smaller than the eye. It abounds from Cape Cod to Texas.

**GOODYEAR, Charles**, American inventor: b. New Haven, Conn., 29 Dec. 1800; d. New York, 1 July 1860. After coming of age, he joined his father in the hardware business at Philadelphia. Among the improved implements introduced by them was the steel pitchfork, a substitute for the heavy iron fork previously used. The firm being overwhelmed by the commercial disasters of 1830, Goodyear selected as a new occupation the improvement of the manufacture of India rubber. The first important improvement made by him was at New York in 1836. This was a method of treating the surface of native India rubber by dipping it into a preparation of nitric acid. This discovery enabled the manufacturer to

expose an India rubber surface in his goods, which on account of adhesiveness was before impracticable. The nitric acid gas process, as it was called, was introduced into public use, and met with great favor, especially in the manufacture of shoes, which continued to be made by that process in great numbers at Providence, R. I., until it was superseded by the invention of vulcanized rubber, for which he obtained a patent in 1844. From this period he employed himself in ascertaining new methods of employing rubber till the patents granted him were 60 in number. He received medals from the exhibitions at London (1851) and Paris (1855), but his rights were continually infringed, and he remained poor while others were enriched by his inventions. Consult Parton, 'Famous Americans of Recent Times' (Boston 1867); Pierce, 'Trials of an Inventor' (New York 1866).

**GOODYEAR, William Henry**, American writer on art: b. New Haven, Conn., 21 April 1846. He was graduated at Yale in 1867, and studied art history in Heidelberg and Berlin 1867-70. He traveled extensively in Europe and the near Orient in making his original studies, especially in architecture. From 1881 to 1886 he was curator in the Metropolitan Museum of Art, New York, and after 1899 he was curator of fine arts in the Brooklyn Institute Museum. He is especially known for his discoveries in the architectural refinements, particularly in mediæval church buildings. In numerous contributions to scientific periodicals he demonstrated that Egyptian, Greek, Roman and mediæval buildings are constructed with intentional asymmetry intended for optical effects. He became honorary member of societies in Rome, Edinburgh, Milan and Venice, and a corresponding member of the Society of American Architects. He has published 'Ancient and Modern History' (1883); 'History of Art' (1887); 'The Grammar of the Lotus' (1890); 'Roman and Mediæval Art' (1893); 'Renaissance and Modern Art' (1894); 'Greek Refinements' (1912); etc.

**GOOKIN, Daniel**, American author and official: b. Kent, England, about 1612; d. Cambridge, Mass., 19 March 1687. He came with his father to Virginia in 1621, whence he removed in 1644 to Massachusetts, in consequence of his sympathy with the doctrines of the Puritans. He settled in Cambridge, was soon after appointed a captain of militia and in 1656 became superintendent of all the Indians who had submitted to the government of Massachusetts, an office which he held till his death. He protected the fugitive regicides in 1661, was appointed one of the two licensers of the Cambridge printing press in the following year, became unpopular during King Philip's War by the protection which, as a magistrate, he extended to the Indians, and in 1681 was made major-general of the colony. His 'Historical Collections of the Indians of Massachusetts' bears the date of 1674, and was first published by the Massachusetts Historical Society in 1792. He is said to have written also a history of New England, of which no manuscript has been found.

**GOORKHAS.** See *GHURKAS*.

**GOOSANDER.** See *MERGANSER*.

**GOOSE.** See **GEESSE.**

**GOOSE-BARNACLE.** See **BERNICLE-GOOSE.**

**GOOSE-FISH, or ANGLER,** a marine fish (*Lophius piscatorius*) of the order *Pediculati*, with an enormous head and mouth, no scales and brightly colored fringes about the jaws, which serve as lures to attract within reach the small fishes on which it preys; the first three rays of the dorsal fin are separated from the others, and spring barbel-like from the top of the head, nodding in the water and attracting other small fishes—hence the name “angler.” Like all fishes of its order, the carpal bones are elongated to strengthen and widen the reach of the pectoral fins, by means of which the fish leaps after its prey. The angler is popularly supposed to catch geese and other swimming birds, whence its name. It reaches a length of four feet, but is useless, and the bane of fishermen. It is remarkable for its pinkish ribbon-like masses of eggs, a foot wide, 40 feet in length, which are not uncommon in summer floating at the surface of the ocean. The goose-fish occurs on both coasts of the north Atlantic and has other names, as “fishing-frog” and “all-mouth.” Near relatives are the batfish and the frog-fishes.

**GOOSE-GRASS, or GOSLING-WEED,** two of the many names applied to a widely distributed troublesome weed (*Galium aparine*). See **BEDSTRAW**; **CLEAVERS.**

**GOOSEBERRY,** various spiny shrubs of the genus *Grossularia*, family *Grossulariaceae*, mostly natives of the northern hemisphere, especially of North America; some species are valued for their fruit (berries), others for their flowers. Of the half dozen species cultivated, the European gooseberry (*G. grossularia*), which appeared in gardens during the 16th century, has developed the largest number of varieties and attracted the widest interest. Its progeny furnish practically all the varieties exhibited at the annual gooseberry shows of England. The fruits of some of these varieties weigh more than an ounce, having been developed by selection and crossing from an original weight of about one-quarter of an ounce. The varieties may be divided, like apples or pears, into culinary and dessert sorts. Of the American species, several of which bear finer fruits than the natural European species, *G. oxycanthoides* is the only one that has produced widely cultivated varieties. It has also entered into many hybrids with the European species. These American varieties are all of the culinary class, or are used while too unripe to be palatable as dessert. The first one, Houghton, was introduced about 1835, and with its seedling, Browning, still commands the market.

The gooseberry is one of the easiest fruits to propagate. Cuttings of mature wood are most frequently used, but layers and suckers are also employed. The plants thrive best upon rather heavy, moist soil, and generally fail upon light soils, especially if dry. They like partial shade and northern exposure. In the South they fail. The plants may be transplanted in spring or fall, about five feet apart each way, cultivated frequently until mid-sum-

mer, trained and pruned like the currant (q.v.), but somewhat more openly, kept free from fungous troubles by the use of a fungicide (q.v.) and of insects by the use of an insecticide (q.v.). The fungi most frequently found upon the plants are mildew (*Sphaerotheca mors-ura*) and leaf spot (*Septoria ribis*). The former, which is a surface feeder, appears upon the green parts as a frost-like gray growth, which later becomes brown. Free circulation of air, good drainage and open training of the bushes help to prevent attacks. Leaf spot produces brown spots upon the foliage, which may fall prematurely. Spraying early in the season is believed to be the only preventive. With few exceptions, the insects that attack the gooseberry also visit the currant (q.v.) and may be combated by the same remedies. Consult Card, ‘Bush Fruits’ (New York 1898); Thory, ‘Monographie ou Histoire Naturelle du Genre Grossellier’; Bailey, ‘Standard Cyclopedia of Horticulture’ (1915).

**GOOSEFOOT,** a family (*Chenopodiaceae*) of annual or perennial herbs, rarely shrubs, with 75 to 80 genera and 550 to 600 species, of wide distribution. The typical genus (*Chenopodium*) contains about 60 species, 15 or 20 of which are native to North America, or have been naturalized, some of them almost ubiquitous weeds, such as the pigweed (*C. album*); the city goosefoot (*C. urbicum*), thriving in suburban lots and roadways; the sowbane (*C. murale*); the feather geranium or Jerusalem oak (*C. botrys*); and the now world-wide Mexican tea or wormseed (*C. ambrosioides*), from which is brewed a homemade vermifuge. Other genera contain allied weeds, as the strawberry blite (*Blitum capitatum*); the large genus (*Atriplex*) of seaside and salt-lane weeds called oraches; the western white sage (*Eurotia lanata*), a gray-green, pubescent fodder plant of the western plains; the sea-blites (*Dondia*) and odd brittle glassworts of salt marshes and the spiny greasewood and Russian thistle (qq.v.). See **CHENOPODIUM.**

**GOPHER,** a name given by the early French settlers in the United States to various animals which honeycomb (Fr. *gaufre*) the ground by burrowing in it. In the Central States the name refers to the too common “striped” gopher, or ground-squirrel (*Spermophilus tridecemlineatus*), a troublesome little animal about 10 inches long, a third of which is tail, which is dark-reddish brown, with 6 to 8 light stripes, alternating with lines of dots—about 13 in all; it is yellowish below, with a broad black stripe on each side. It is a familiar object on prairies and grassy fields throughout the upper half of the Mississippi Valley, hurrying to and from its hole, or standing upright, but inconspicuous, curiously watching your movements, but ready to drop out of sight at the least alarm. The burrows are numerous everywhere and are injurious not only by the space they occupy and as traps for the feet of horses and cattle, but because they offer runways for water and so promote washing away of soil. Some of the holes are short and are merely shelters; others are long, have a nest at the inner extremity and side-chambers in which in the autumn large winter stores of seeds are laid away. Where these spermophiles are very numerous, as they have become in the

grain-growing districts of Iowa, Minnesota and the Dakotas, the amount of grain stolen or shaken down is a serious tax on agriculture. Another spermophile, more common northward, is Franklin's or the "gray" gopher (*S. franklini*), which is much larger and has a harsh coat of yellowish-grizzled hair. Several other species inhabit the more western plains. All are truly ground-squirrels of the family *Sciuridae*, and closely related to the chipmunk (q.v.).

In the farther Northwest, however, the word "gopher" ordinarily means one of the large gray rodents of the family *Geomys*, distinguished prominently by having in the cheeks capacious pouches, lined with fur; hence they are called pocket-gophers and pouched rats. The most familiar species is *Geomys bursarius*, which is about nine inches long and has short legs, close ears and a short hairy tail; the fore feet are very strong, with the three middle toe-nails long and well adapted to digging, and its burrows are made with surprising rapidity. Its food includes all sorts of vegetable matters, and it often injures orchards by gnawing the roots. As fall approaches it gathers a store of seeds, tuberous roots, nuts, etc., and stows it in its deep residence-burrow, where the winter is passed in a partial torpidity varying with the climate. These provisions are carried in the cheek-pouches, which also serve to take out the loose soil from the burrows. On the Pacific Coast occur several other species, some with large, pendant cheek-pouches. In the Southern States is found a species (*G. tuxa*), locally called "Salamander," of large size and common in the sandy parts of Florida and the country north of it. The Northwest has a second and smaller kind of gopher (*Thomomys talpoides*), dusky bluish-gray in color, with the lower parts whitish, which is mole-like in its habits, and is known in Idaho as "camass-rat," on account of its fondness for the tubers of the lilaceous plant called camass (*Camassia esculenta*) by the Indians.

All of these animals are a pest to agriculture, and are increasing rather than diminishing in settled regions, owing partly to the increased food afforded them by crops, and partly to the destruction of their natural enemies, the birds of prey, snakes, weasels, foxes, badgers, wolves, etc., which formerly held them in check. Efforts are therefore made to exterminate them in various ways, of which the most effective is by suffocating them with bisulphide of carbon, placed in their holes by saturating some porous object and rolling it into the burrow. Several pamphlets issued by the United States Department of Agriculture describe the animals and their habits, and give directions for their suppression.

**GOPHER SNAKE, or INDIGO SNAKE**, a variety of a tropical colubrine serpent (*Spilotes corais*, variety *conperi*), common in the southwestern United States and eastward to Georgia, which reaches a length of seven and one-half feet, and varies in color from brownish black in Mexico through deep blue to pure black in Florida and Georgia, always with reddish markings about the mouth and throat. The surface of the skin is so highly polished as to look glassy. "Its smooth, glittering length of blue-black body flashing with prismatic colors along the broad plates of the under

surface, and its good-natured demeanor, combine to make it," says Ditmars, "a favorite in collections." This snake burrows beneath loose soil, and is harmless to man, aiding him, indeed, in getting rid of rats, and in destroying as its prey, gophers, ground squirrels, frogs and other pestiferous animals, including rattlesnakes. It is a near relative of the tropical rat-snakes and of the northern blacksnakes. Consult Ditmars, 'Reptile Book' (New York 1907).

**GOPHER STATE**, a name sometimes given to Minnesota.

**GOPHER TORTOISE or TURTLE**, a burrowing turtle (*Xerobates polyphemus*) of the southern United States, brownish in color with black head; yellowish below. It is herbivorous and gregarious, and is most frequently found in the pine barrens, where it is frequently eaten by the negroes, who are also fond of its eggs.

**GORAL**, Boleslaus Edward, Polish-American clergyman and editor: b. Koenigsdorf, Prussian Poland, 12 March 1876. He received his early training at Koenigsdorf, came to the United States in 1889, and received his higher education at the Seminary of Saints Cyril and Methodius, Detroit, and Saint Francis Seminary, Saint Francis, Wis. He was ordained to the priesthood in 1899 and was successively professor of Polish, German, French, Greek and Latin (1899-1906) and of homiletics and philosophy from 1906 to 1908 at Saint Francis Seminary, Saint Francis, Wis. Since 1908 he has been president and treasurer of the Milwaukee Polish daily, *Nowiny, Polskie*, and rector (1908-09) of Saint Vincent de Paul's, Milwaukee, and after 1909 of Saint Hyacinth's, Milwaukee. He was founder and editor of the *Oredownik Językowy* and organized the weekly *Nowiny* in 1906, changing it to a daily in 1907. He is the author of 'Zasady interpunkcyj polskiej' (1905); verses and essays 'Bells of Corneville'; translations of drama and poetry. He collaborated in 'Memories of Milwaukee County' (1900); 'The Catholic Encyclopedia,' etc.

**GORAL**, a goat-like antelope (*Nemorhædus goral*) from the Himalaya Mountains. It resembles somewhat the chamois, and remains in small bands on the highest parts of the mountains. Other species or varieties inhabit the high plateaus of Tibet and Mongolia.

**GORAMY, or GOURAMI**, the Javanese name of a fish of the genus *Osphromenus* (*Oolfax*), family *Anabasidae* or climbing perches, a native of China and the Eastern Archipelago, but introduced into the Mauritius, West India Islands and Cayenne on account of the excellence of its flesh, where it has multiplied rapidly. It is deep in proportion to its length, and the dorsal and anal fins have numerous short spines, while the first ray of the ventral is protracted into a filament of extraordinary length. It is one of the few fishes which build nests, which it does by interweaving the stems and leaves of aquatic plants.

**GORDIACEA**, a class in the phylum Nematelminthes (q.v.), or roundworms. They are common at times in springs, ponds and even watering-troughs. Popularly they are known as hair snakes, being supposed to

develop from horse hairs that have fallen into the water. The early stages of existence are passed as parasites in the bodies of various insects, chiefly grasshoppers and crickets, from which they break out when fully grown. The adult condition is entirely without means of securing nourishment as the mouth or esophagus is occluded and the stage serves only for reproduction. Consult Ward and Whipple, 'Fresh Water Biology' (New York).

**GORDIAN KNOT**, a knot tied by Gordius in the rope which bound the yoke of his chariot to the axle-tree in such an artful manner that the ends of the cord could not be perceived. The Phrygians had learned by an oracle that a king would come to them riding in a car, and Gordius appearing thus at an opportune time received the kingdom. He dedicated his car and yoke of oxen to Zeus, with the knot still untied. So intricate was it that the report went abroad that the empire of Asia was promised by the oracle to him who could untie it. Alexander the Great, wishing to inspire his soldiers with courage and his enemies with the belief that he was born to conquer Asia, cut the knot with his sword, and so claimed to have fulfilled the oracle. Hence to 'cut the Gordian knot' is equivalent to removing or solving a difficulty by bold or unusual measures.

**GORDIANUS, Marcus Antonius**, the name of three Roman emperors, father, son and grandson. The first, b. 158 A.D., had governed Africa for many years, when he was proclaimed emperor at the age of 80. He associated his son with him in the empire, but six weeks later the son was killed in fighting against the rival emperor Maximinus, and the father, in an agony of grief, died by his own hand. The grandson was proclaimed emperor by the soldiers in Rome 238 A.D., although not more than 15. He reigned six years, when he was assassinated by his soldiers at the instigation of Philip, prefect of the Prætorian Guard.

**GORDON, Adam Lindsey**, Australian poet; b. 1833; d. 1872. He was born in the Azores, educated in England and migrated to Australia in 1851, where he became a horse dealer and trainer and the best steeplechase rider in the country. He is one of the strongest and most distinctive of Australian poets. In narrative and sporting poems based on his own wild experiences he first taught the outlander to get at the heart of Australia. He glorifies the horse and rider in ballads that have the ring of Scott and Macaulay. A Byronic influence in his work seems never to leave it. He is a bundle of moods and at times his despair is great. His published works include 'Sea-spray and Smoke-drift' (1867); 'Ashtaroth' (1867) and 'Bush Ballads' (1870). See AUSTRALIAN LITERATURE.

**GORDON, Andrew**, Benedictine monk, physicist; b. Coffarach, Forfarshire, Scotland, 15 June 1712; d. Erfurt, Saxony, 22 Aug. 1751. In 1737 Gordon became professor of natural philosophy at Erfurt. He introduced improvements in the frictional electric machine, and invented what is known as the electric whirl, a device that rotates a light wheel by currents of air repelled from it by static electricity. Another invention of his was the so-called 'electric chimes.' He published 'Phænomena elec-

tricitatis exposita' (1744); 'Philosophia utilis et jucunda' (1745); 'Versuch einer Erklärung der Electricität' (Erfurt 1745); 'Physicæ experimentalis elementa' (1751-52).

**GORDON, Charles George** ("CHINESE GORDON" or "GORDON PASHA"), English soldier; b. Woolwich, 28 Jan. 1833; d. Khartum, Africa, 27 Jan. 1885. He entered the Royal Engineers as second lieutenant in 1852, and served in the Crimean War and during the Taiping rebellion, with the permission of the English military authorities, assumed the command of a special corps of Chinese, trained and led by European and American officers. With these materials he performed marvelous feats of skilful soldiery and succeeded in completely crushing the rebellion. The Chinese government was eager to express its gratitude, but he refused all offers of substantial reward. On his return to England with the rank of colonel, he was appointed chief engineer officer at Gravesend for the construction of the Thames defenses. Here, while his engineering work afforded ample scope for his military talents, the philanthropy of his nature had full scope. During the six years he lived at Gravesend his house was school and hospital and almshouse in turn. Many a waif he rescued from the gutter, establishing evening classes for their benefit and keeping sight of the more deserving till they were provided with a career in life; all this being done on his pay as an English colonel, without any private resources whatever. In 1873 Gordon was governor of the Equatorial Provinces of Egypt. Being thwarted by the governor of the Sudan in his efforts to suppress the slave trade he resigned and returned to England. He again took up the post in 1877, on condition that he should be permitted to abolish the slave trade, which he successfully accomplished. In 1880 he went to China as adviser to the government there during their strained relations with Russia. In 1881-82 he was commanding engineer in the Mauritius, and served for a brief period in the latter year in South Africa. In 1884 he paid a visit to the Holy Land. In 1881 Mohammed Ahmed, a Mussulman enthusiast, had given himself out to be the Mahdi—the long-expected Redeemer of Islam—and gathered a number of followers around him who threatened the safety of the Egyptian garrisons in the Sudan. It having been decided in 1884 that the Sudan be evacuated, the presence of an English officer of high authority at Khartum was asked, with full power to withdraw all the garrisons in the Sudan, and make the best arrangements possible for the future government of the country. Gordon, at the request of the British government, proceeded to the Sudan in the hope that his great personal influence and knowledge of the country would help to set matters right. These hopes were not fulfilled; Gordon was shut up in Khartum by the troops of the Mahdi, and for a whole year he held that town against the Arabs who surrounded him. An English force under Wolseley was dispatched for his relief, an advance corps of which sighted Khartum on 28 Jan. 1885, to find that the town had been treacherously betrayed into the hands of the Mahdi two days before, and that its heroic defender had been killed. Gordon had all the qualities which are found in a successful military leader, modified, however, by strong

religious feeling which shaded into mysticism, and which latterly became so intensified as to give him somewhat the character of a religious fatalist. He left a most interesting journal, kept during the latter period of his siege in Khartum. Consult Hill, 'Gordon in Central Africa' (1881); lives by Forbes (1884); Henry Gordon (1886); Boulger (1896). An interesting chapter on his last mission will be found in Morley's 'Life of Gladstone,' book VIII, chap. IX.

**GORDON, Charles William** ("RALPH CONNOR"), Canadian author: b. Indian Lands, Glengarry, Ontario, Canada, 1860. He graduated at Toronto University in 1883 and at Knox College in 1887; was ordained to the Presbyterian ministry and was a missionary in the mining and lumbering regions of the Northwest Territories 1890-93. He became pastor of Saint Stephen's Church, Winnipeg, in 1894, and has written 'Beyond the Marshes'; 'Black Rock'; 'The Sky Pilot'; 'The Man from Glengarry'; 'Glengarry School Days'; 'The Prospector'; 'The Foreigner'; 'Corporal Cameron'; and 'The Major' (1917); works characterized by vivid descriptions of life and scenery in the Canadian west.

**GORDON, Lord George**, English agitator: b. London, 26 Dec. 1751; d. there, 1 Nov. 1793. He was a son of the Duke of Gordon, in his youth served in the navy, and entered Parliament in 1774. In 1778 a bill having been passed through Parliament for the relief of Roman Catholics from certain penalties and disabilities, a society called the Protestant Association of London was formed for the purpose of procuring its repeal. In the following year Lord George was elected its president, and in June 1780 headed an excited mob of many thousands, who went in procession to the House of Commons to present a petition against the measure. The dreadful riot which ensued, in which the city magistrates acted a feeble and incompetent part, was not suppressed till after the destruction of many Catholic chapels and dwellings, the prison of Newgate—the 2,000 inmates of which formed a sensible addition to the strength of the rioters—and the house of the chief justice, Lord Mansfield. Three hundred persons were killed, 192 rioters were arrested and 25 executions followed. Gordon was arrested on a charge of high treason, but no evidence being adduced of treasonable design, he was acquitted. He was convicted in 1787 of libels on the English courts and on Marie-Antoinette, and sentenced to five years' imprisonment. For Gordon and the riots see Dickens' vivid description in 'Barnaby Rudge.' Consult also Watson, 'Life of Lord George Gordon' (London 1795; and Vol. XXI of Cobbett's 'State Trials.') For a number of years before his death he was a zealous professor of the Jewish faith.

**GORDON, George A.**, American Congregational clergyman: b. Aberdeenshire, Scotland, 1853. In 1871 he came to America, and in 1874 entered the Bangor Theological Seminary, whence he was graduated three years later. His first work was at Temple, Me., after which he studied for a year at Harvard, and in 1881 was pastor at Greenwich, Conn. In 1884 he became pastor at Old South Church, Boston.

From 1886-90 he was university preacher at Harvard and from 1888-1901 at Yale. Bowdoin and Yale conferred on him the degree of D.D. (1893) and Harvard the degree of S.T.D. (1895). Columbia awarded him the same honor in 1903. Among his publications are 'The Witness to Immortality' (1893); 'The Christ of To-Day' (1895); 'Immortality and the New Theology' (1897); 'The New Epoch for Faith' (1901); 'Ultimate Conceptions of Faith' (1903); 'Through Man to God' (1906); 'Religion and Miracle' (1909); 'Revelation and the Ideal' (1913).

**GORDON, George Henry**, American soldier: b. Charlestown, Mass., 19 July 1824; d. Framingham, Mass., 30 Aug. 1886. Graduated from West Point in 1846, he was employed on various duty, later resigned from the army and practised law 1857-61. In 1861 he organized the Second Massachusetts Volunteers, and became colonel of the regiment. He commanded the United States troops in Florida in 1864, the eastern district of Virginia in 1865, and was mustered out in the latter year with rank of brigadier-general and brevet major-general of volunteers. He wrote a 'History of the Second Massachusetts Regiment' (1876), and other works on the war.

**GORDON, John Brown**, American soldier: b. Upson County, Ga., 6 July 1832; d. near Miami, Fla., 9 Jan. 1904. He was of Scotch ancestry, his grandfather being one of seven brothers who all fought for American independence in the War of the Revolution. He was graduated at the State University in 1852 and was, a few months later, admitted to the practise of law; but at the outbreak of the Civil War was engaged in mining operations near Raccoon Mountain, Alabama. Here was organized a company, called the "Raccoon Roughs," of which he was elected captain. This company was assigned to the 6th Alabama Infantry, in which he rapidly rose through successive grades to that of colonel (28 April 1862). At Seven Pines, through the wounding of General Rodes, the command of the brigade fell upon him; and at Malvern Hill he led it in the grand charge of D. H. Hill's division against the Federal position. At Sharpsburg he was five times wounded. On 1 Nov. 1862 he was commissioned brigadier-general with command of a Georgia brigade of six regiments, which he led with great distinction at Chancellorsville and Gettysburg. On the march into Pennsylvania, just before the battle of Gettysburg, he reached Wrightsville on the Susquehanna, making the most extended advance achieved in the East by Confederates during the war. On the first day at Gettysburg he struck the extreme right of the Union army in Ewell's grand turning movement, by which the victory so desperately striven for by A. P. Hill was secured, and the Federals were driven through the town of Gettysburg to the heights beyond. On 6 May 1864, in the Wilderness leading two brigades, he fell at sunset upon Sedgwick's corps, driving the Federals from a large part of their works and capturing 600 prisoners, including Generals Seymour and Shaler.

On 12 May at Spottsylvania Court House, commanding Early's division, immediately after Hancock had overwhelmed Edward Johnson,

Gordon by an impetuous charge first checked the Federals and then drove them back to the base of the salient, where the fight continued with great fury to the close of the day. Two days later Gordon was commissioned major-general and placed in command of Evans' Georgia brigade, Hays and Stafford's Louisiana brigades and Terry's Virginia brigade—the latter being made up of the remnants of the "Stonewall" brigade and other Virginia troops. With this command he participated, under Early, in the defeat of Hunter's expedition, the invasion of Maryland, the victory at the Monocacy, the march into the suburbs of Washington and the battles against Sheridan in the Shenandoah Valley, being especially distinguished in the surprise and rout of Sheridan's army in the early morning at Cedar Creek. Having been assigned to the command of the Second corps of the Army of Northern Virginia, he held his lines with great tenacity, and in March 1865 made the brilliant dash by which he captured Fort Steadman and parts of the line to the right and left of it. Owing to the failure of the supporting column to arrive in time, he was obliged to retire to his original position. On the retreat from Petersburg he protected the rear, and at Appomattox commanded half of Lee's army, making a last brilliant charge of that heroic but now fearfully depleted host. After the surrender he called his men about him and made them a speech remarkable for its strong declarations of faith in God and earnest exhortations to endure defeat with patience, obey the laws and rebuild their ruined homes and fortunes. He became the trusted leader of his people, was twice elected governor of Georgia, and for two terms represented his State in the Senate of the United States, on all occasions using his influence for peace and fraternity between the late warring sections. As commander-in-chief of the United Confederate Veterans' Association he possessed the enthusiastic love and devotion of his comrades, who would never entertain the idea of his retirement from the office to which they every year elected him, declaring repeatedly that death alone could remove him from that post of honor. His very successful lecture on "The Last Days of the Confederacy" was well known in both North and South. His war-time reminiscences began to appear in *Scribner's Magazine* in 1903 and were published in book form in 1905.

JOSEPH T. DERRY,

Author of 'The Story of the Confederate States.'

**GORDON, Julien.** See CRUGER.

**GORDON, Leon,** Russian writer: b. 1831; d. 1892. His early labors were in the line of education, being engaged as Hebrew teacher in the governmental schools of Welná for 20 years and doing much to improve conditions, despite charges of heresy made against him. In 1872 he was called to Saint Petersburg as secretary of the Jewish community and of the society for promoting culture among Jews, which gave him the opportunity to enlarge his literary activity. Here, too, his zeal excited enmity, and accused of participating in 1879 in the attempt to assassinate Alexander II, he and his family were thrown into prison and later exiled, but his innocence was quickly proved and

he returned to Saint Petersburg, losing his former position. He then became journalist for two years and was made "honorary citizen" by the government. He was the leading Hebrew poet of his day and a prose writer of much satirical force. His work was twofold—to attack fanaticism within the camp and to defend his religion against its enemies from without. He collaborated in translating the Pentateuch into Russian.

**GORDON-CUMMING, Constance Fred-erica.** See CUMMING, CONSTANCE.

**GORE, Charles,** English bishop: b. 1853. After studying at Harrow and Balliol College, Oxford, he became Fellow of Trinity College, Oxford (1875-95). From 1880-83 he was principal of Cuddesdon College, and was selected to take charge of the Pusey Library at Oxford, which post he held from 1884 to 1893. In that year he was appointed vicar of Radley, which he left in 1894 to become canon of Westminster. From 1898-1900 he was honorary chaplain to the queen; chaplain in ordinary to the queen (1900-01); chaplain in ordinary to the king (1901). He was appointed bishop of Worcester (1902-04); bishop of Birmingham (1905-11) and bishop of Oxford (1911). He was also editor of *Lux Mundi*, in which many of his publications appeared. He is the author of 'The Holy Spirit and Inspiration' (1890); 'The Church and the Ministry' (1889); 'Roman Catholic Claims' (1889); 'Leo the Great' (1890); 'The Mission of the Church' (1891); 'The Creed of the Christian' (1895); 'The Body of Christ' (1901); 'Spiritual Efficiency' (1904); 'The Permanent Creed' (1905); 'The New Theology and the Old Religion' (1908); 'Orders and Unity' (1910); 'The Question of Divorce' (1911).

**GORE, Christopher,** American statesman: b. Boston, 21 Sept. 1758; d. Waltham, 1 March 1827. He was graduated at Harvard College in 1776, and studying law, was soon engaged in good practice. In 1789 he was appointed the first United States district attorney for Massachusetts; in 1796 was chosen one of the commissioners to settle the claims of the United States upon Great Britain for spoiliations, and remained in London, successfully engaged in the duties of this office, about eight years. In 1803 he acted as chargé-d'affaires during the absence of the American Minister; in 1809 was chosen governor of Massachusetts; and in 1814 was elected to the United States Senate. He left about \$100,000 to Harvard College. Gore Hall, the library building at Harvard, is named in his honor.

**GORE-BOOTH, Eva,** Irish author: b. Tissadel, Sligo, Ireland. She is well known as an advocate of women's suffrage and as a trade union worker and writer. For years she has been known also as a poet of extraordinary power and charm. Her early verse was thoroughly Irish in spirit, and one of her poems, 'The Perilous Light,' a simple but exquisite little lyric, has received such high praise and has been so widely quoted that it may be called a contemporary classic. Her published works include 'Unseen Kings'; 'The One and the Many'; 'The Egyptian Pillar'; 'The Sorrowful Princess'; 'The Agate Lamp'; 'The Three Resurrections and the Triumph of Mæve'; and

GENERAL JOHN BROWN GORDON

'The Death of Fionavar' (1916). The last named is a poetic drama, which may be described as a plea for peace, a glorification of non-resistance, a Goethe-like defense of thought against action. There is a touch of irony in the fact that this most passionately pacific work should be illustrated by so convinced and practical a direct actionist as the author's sister, the Countess Markiewicz, the most picturesque figure of the Irish uprising of 1916.

**GORGEANA**, gôr-jê-ân'a, Me., now York (q.v.), the first colonial incorporated city in the United States. On 2 Dec. 1631 a grant was made to Sir Ferdinando Gorges and others of 24,000 acres on both sides of the Accomenticus (Agamenticus, now York) River. Settlements were founded here, and on 10 April 1641 were formed into a borough named Accomenticus or Agamenticus, which on 1 March 1642 was given a city charter as Gorgeana, with a full apparatus of mayor, aldermen, courts, etc. It had an extent of three miles on the coast and seven up the river, a small tidal stream. In 1652 Maine submitted to Massachusetts; and to avoid the city charter and Gorges' rights, Gorgeana was reincorporated as the town of York.

**GORGES**, gôr-jêz, Sir Ferdinando, colonial proprietor of Maine, "the father of English colonization in America": b. Ashton, Somersetshire, about 1565; d. 1647. He served in the Low Countries and against the Spanish Armada, and in 1596 was appointed governor of the forts and islands of Plymouth. He was a partner in the conspiracy of the Earl of Essex, against whom he testified on his trial in 1601. When Waymouth returned in 1605 from his voyage to North America, and brought with him five Indian captives, Gorges took three of them into his house, caused them to be instructed in the English language, obtained information from them of the "stately islands and safe harbors" of their native country and determined to become a proprietor of domains beyond the Atlantic. He persuaded Sir John Popham, lord chief justice of England, to share his intentions, and in 1606 the king incorporated two companies, the London colony, and the Plymouth colony, between which was divided the territory extending 50 miles inland from the 34th to the 45th parallel north latitude. The Plymouth colony had the northern portion, which was styled North Virginia. Three ships with 100 settlers sailed from Plymouth 31 May 1607, and reached the mouth of the Kennebec in Maine, where they began a settlement, abandoned the next spring. In 1616 Gorges sent out Richard Vines with a party, which through the winter encamped on the river Saco. In 1620 Gorges and his associates obtained a new incorporation for "the governing of New England in America," which was empowered to hold territory extending westward from sea to sea between the 40th and 48th parallels north latitude. Gorges himself united with John Mason in taking grants of the district called Laconia, bounded by the Merrimack, the Kennebec, the ocean and "the river of Canada," and under his auspices several settlements were attempted. His son, Robert Gorges, was appointed in 1623 by the council for New England "general governor of the country." This council resigned its charter to the king in 1635, and the elder

Gorges now determined to establish a miniature sovereignty on his own domain. To this end he obtained from the king a charter constituting him lord proprietary of the province of Maine, with extraordinary governmental powers, to be transmissible with the property to his heirs and assigns. He sent his son Thomas to be deputy governor and the officers took an oath of allegiance to the lord proprietary. The province was divided into two countries, of which Agamenticus (now York) and Saco were respectively the principal settlements; the former received a city charter, as Gorgeana, in 1642. But the fatal want was a deficiency of subjects; probably two-thirds of the adult males were in places of authority; yet the little monarchy continued for nearly 10 years. When the four New England colonies formed a confederacy in 1643, the settlements of Gorges were excluded from it. On the death of Gorges—who had adhered to the Royalist side in the civil war—his colonists at length formed themselves into a body politic for the purpose of self-government and submitted to the jurisdiction of Massachusetts. Consult his 'Brief Narration of the Original Undertakings of the Advancement of Plantations into the Parts of America' (1658) in Maine Historical Society's Collections; and Baxter, 'Sir Ferdinando Gorges and His Province of Maine' in the Prince Society Publications (3 vols., Boston 1890).

**GORGAS**, gôr-jî-as, Greek orator and sophist: b. Leontini, in Sicily. He flourished in the 5th century B.C., and was one of the earliest writers on rhetoric. He was one of the first who introduced cadence into prose. He also treated of commonplaces, and showed the use of them for the invention of arguments. This induced Plato to give the name of 'Gorgias' to his elegant dialogue on this subject. Gorgias is said to have reached the extraordinary age of 107 or 108 years. Two works attributed to him are extant, 'The Apology of Palamedes,' and the 'Encomium on Helena,' but their genuineness has been questioned by several critics. See Jebb, 'Attic Orators.'

**GORG**, gôr-gô, or **GORGON**, according to Homer, one of the frightful phantoms of Hades; but Hesiod mentions three Gorgons, Stheno, Euryale and Medusa. They were all immortal, except Medusa. Their hair was entwined with serpents, their hands were of brass, their body covered with impenetrable scales, their brazen teeth as long as the tusks of a wild boar and they turned to stones all those who looked upon them. According to some authors, Perseus, when he went to the conquest of the Gorgons, was armed with an instrument like a scythe, by Hermes, and provided with a looking-glass by Athena, besides winged shoes and a helmet of Pluto, which rendered all objects clearly visible and open to the view, while the person who wore it remained totally invisible. With weapons like these Perseus obtained an easy victory. The head of Medusa remained in his hands, and he gave it to Athena, who placed it on her Ægis, with which she turned into stones all such as fixed their eyes upon it. The residence of the Gorgons was beyond the ocean toward the west, according to Hesiod.

**GORGONIA**, the type-genus of the *Gorgonida*, a family of alcyonarian coral-polyps, the "sea-fans" or "sea-whips," which have a

calcareous or horny axis, the colony often greatly branched and the branches anastomosing. In the common gorgonia (*Rhipogorgia flabellum*) of the West Indies and Florida Keys the branches form a flat net-work. In this and other sea-fans the short calices of the single retractile polyps stand perpendicularly to the axis, communicating by longitudinal vessels and branching canals. While by far the greater majority of the species are inhabitants of tropical waters, in the Arctic seas, and in the deeper, cold waters of the Newfoundland banks, and on Saint George's Bank, two large species occur: *Primnoa reseda* and *Paragorgia arborea*; the latter is of great size, the stem being as thick through as a man's wrist and the entire coral-stock over five feet in height.

**GORILLA**, the largest of the anthropoid apes. This term is derived from the "Periplus" of the Carthaginian navigator, Hanno, who described, 500 years before Christ, an island on the west coast of Africa as full of wild men, which his interpreter called Gorilloi. When, therefore, Dr. Thomas Savage brought the first specimen of this animal to the attention of science, in 1847, the name "gorilla" was applied to it. It now appears probable that the "Gorilloi" of Hanno were probably baboons. In 'Purchas, His Pilgrims' (1613) an account is given of a great ape "called by the Europeans gorilla," and Bowditch describes the same animal (1819) in 'Mission from Cape Coast Castle to Ashantee.' In 'Western Africa' (1856) L. Wilson made the first scientific investigation of the gorilla on the ground. The gorilla of science, of which but one species is known (*Gorilla gorilla*), is, with the chimpanzee and the orang-outang, the nearest living relative of man. Structurally it is very closely allied to the chimpanzee. The male is from five and one-half to six feet in height, while the female is much shorter, measuring generally about four and one-half feet. Both are very heavy for their height, and the male generally exceeds man in weight; both male and female have very broad and powerful chests and shoulders and exceedingly long, well-developed strong arms. The legs on the contrary are short, thick-set and consequently powerful and the hands and feet are of a like nature and description. The hair-covered body presents a grim and grayish, grizzled aspect. The skin is black, the hair being blackish and turning gray in old individuals. The skull has the supraorbital ridges greatly developed and the crest in the sagittal line is large. The arms are long, the hand reaching to about the middle of the shank, while the hands are webbed to the end of the first joint of the fingers. In the foot the heel is more apparent than in other anthropoid apes, correlated with its more terrestrial life. The gorilla walks upon all fours, a gait rendered possible by the very long arms.

These apes are limited in their distribution to the forested region of the Gaboon, and go about in families led by an old male. They are mainly diurnal in their habits, seeking their food, which is largely vegetable, during the day. At night the female and young are said to ascend a tree, while the male sleeps at its foot. The stories told of the ferocity of the gorilla are exaggerated; it is an extremely dangerous animal only when brought to bay. When defending

itself against an attack the male stands erect and is said to knock his adversaries down with his hand and then to use his powerful teeth, the canines of which are greatly developed. Consult Elliott, 'A Review of the Primates' (New York 1913); Forbes, O. H., 'Monkeys' (New York 1894); Hartmann, 'Anthropoid Apes' (New York 1885); Huxley, 'Man's Place in Nature' (London 1890); Keith, 'Proceedings of the Zoological Society of London' (London 1899); 'Royal Natural History' (London 1895); 'Standard Natural History' (Boston 1885).

**GORKY, Maxim**, pen name of Alexei Maximovitch Pyeshkoff, Russian author: b. 14 March 1868. He was orphaned at nine, ran away and served on a Volga River steamer, and was successively a painter of ikons, scullery boy, gardener, watchman, baker, porter, vendor of apples and lawyer's clerk. At 19 in a fit of despair he attempted to commit suicide. In 1891 he wandered on foot in the company of tramps all over South Russia — the class he was afterward to depict so compellingly in his short stories. In 1892 his first story, 'Makar Chudra,' appeared in an obscure Caucasian journal; and the discerning at once observed that a new force had arisen in Russian literature. In 1906 he made an extended tour over Europe, and crossed to the United States, where on account of his bringing with him a woman who was not his wife he was subjected to a good deal of criticism and ostracized, and he left the country. In full sympathy with Russian revolutionary propaganda, was twice arrested and banished, and resided for a number of years on the island of Capri. He was permitted to return to Saint Petersburg in 1914, and joined the Russian army. He was associated with the movement that led to the dethronement of the Tsar Nicholas II in 1917. The varied scenes and persons he saw in his vagabond life among the lowest of the population furnished him with rich material for his literary work, in which he takes upon himself to interpret *la misère* as it is in western and southwestern Europe. His favorite type is the social rebel in full revolt against society. His style is like a flash-light revealing features of debased or tragic character with vivid realism, but his view of his subject is tinged with melancholy pessimism. He is great in the short story, but not so successful in his longer works. His plays abound in strong situations, but they are lacking in dramatic cohesion. Among English translations of his works may be mentioned the following: 'The Oréoff Couple' and 'Foma Gordyeev' (1901); 'Twenty-six and One' and 'Tales from Gorky' (1902); 'Heartache, and The Old Woman Izerofel' (1905); 'The Individualists' (1906); 'Mother' (1907); 'The Spy' (1908); 'A Confession' (1910); 'My Childhood' (1915); 'In the World' (1917), and the dramas 'The Smug Citizen,' and 'A Night's Lodging.' See NIGHT'S LODGING.

**GORMAN, Arthur Pue**, American legislator: b. Howard County, Md., 11 March 1839; d. Washington, D. C., 4 June 1906. Up to his 27th year he was a page in the United States Senate. He was then appointed collector of internal revenue in the Fifth District of Maryland. In 1869 he was made general superintendent of the Chesapeake and Ohio Canal

Company, and from 1872 was president of that corporation. His influence as a Democrat extended from the affairs of Maryland to national affairs and from the house of delegates in his native State he was elected in 1893 to serve as senator of the United States; to which office, after three years of private life, he was re-elected in 1902. He was prominent in opposing the Force Bill of 1889 and took part in the retraining of the Wilson Tariff Bill in 1894.

**GORRINGE, gör'rinj, Henry Honeychurch,** American naval officer: b. Barbadoes, W. I., 11 Aug. 1841; d. New York, 6 July 1885. He came to the United States in youth, entered the Union navy in 1862 and served under Admiral Porter. He was promoted lieutenant-commander in 1865. He accomplished the removal of the Egyptian obelisk (Cleopatra's Needle), which the khedive had presented to the United States, from Egypt to New York city in 1880. He published a 'History of Egyptian Obelisks' (1885).

**GORSE, or WHIN.** See *FURZE*.

**GORST, Sir John Eldon,** English legislator: b. Preston, 24 May 1835; d. London, 4 April 1916. He was educated at Saint John's College, Cambridge. He was civil commissioner of Waikato, New Zealand, from 1861 to 1863. In 1866-68 he was in Parliament as Conservative member for Cambridge University, from 1875 to 1892 represented Chatham and from 1892 to 1906 sat again for Cambridge. He failed of re-election in the latter year. He was appointed Solicitor-General in 1885, and afterward was successively Under Secretary of State for India 1886-91; deputy chairman of committees, House of Commons, 1888-91; financial secretary of the Treasury 1891-92; rector of Glasgow University 1893-94; and vice-president of the committee of the Council on Education from 1895 to 1902. After 1903 he actively opposed Mr. Chamberlain's tariff-reform proposals. He wrote 'The Children of the Nation: How their Health and Vigor should be Promoted by the State' (1907) and 'New Zealand Revisited' (1908).

**GORTCHAKOFF, gör-chä-kof', Alexander Mikhail'ovitch,** Russian diplomatist; cousin of the general of the same name: b. Saint Petersburg, 16 July 1798; d. Baden-Baden, 1 March 1883. He entered the diplomatic service in 1824 as secretary to the Russian embassy in London. His experience in diplomacy was extended in Vienna, Florence, Stuttgart and elsewhere, and he showed great skill in securing the neutrality of Austria during the Crimean War. In 1856 he became Minister of Foreign Affairs, and in 1862 Chancellor of the empire, having by that time made himself one of the foremost diplomatists of Europe. He was friendly to the North during the Civil War in the United States, and his attitude helped restrain France and England from openly recognizing the Confederate government. He maintained close and friendly relations with Bismarck until 1878 when at the Berlin Congress over the war with Turkey he felt that Russia had been deserted by Germany. He set about negotiating the Franco-Russian entente, and Bismarck retaliated by forming the Triple Alliance. De Giers succeeded Gortchakoff as Minister of Foreign Affairs in 1882, but he continued in the office of chancellor until his death. Consult

Bismarck, 'Autobiography,' trans. by Butler (New York 1899); Klagko, 'The Two Chancellors,' trans. by Tait (ib. 1876); Ranband, Alfred, 'A Popular History of Russia,' Vol. III (Boston 1882). See *RUSSIA*; *RUSSO-TURKISH WAR*.

**GORTCHAKOFF, PRINCE Mikhail,** Russian general: b. 1795; d. Warsaw, 30 May 1861. He took part as an artillery officer in the battle of Borodino in 1812 and served in the subsequent campaigns of the allies against the French. He acquired also a brilliant reputation in the Polish War of 1831; and in 1846 he was made governor of Warsaw. In 1855 he was appointed commander-in-chief in the Crimea, where he conducted the defense of Sebastopol. In 1856 he returned to Poland as governor of the country. By his express desire his body was carried to Sebastopol and buried in the place he had so long and so bravely defended.

**GORTON, Samuel,** New England enthusiast and first settler of Warwick, R. I.: b. Gorton, England, about 1600; d. Rhode Island, November or December 1677. He did business in London as a clothier until 1636, when he embarked for New England and settled at Boston. Religious disputes induced him to remove to Plymouth, where we first hear of him as a preacher. He soon exhibited such peculiar views that he was banished from the colony on a charge of heresy. With a few followers he then went to Aquetneck or Rhode Island, which had recently been settled by exiles from Massachusetts Bay; but falling again into trouble, was publicly whipped for calling the magistrates "just asses" and for other contemptuous acts and was forced to seek an asylum with Roger Williams in Providence about 1641. Here he became involved in the disputes of the colonists on certain questions of boundary. Gorton was then summoned to Boston but refused to recognize the jurisdiction thus assumed and about the same time removed to Shawomet, on the west side of Narragansett Bay, where he purchased land from the Sachem Miantonomo. But in June 1643 two inferior sachems contested his claims to the land and applied to the General Court at Boston for assistance. A body of 40 soldiers were consequently marched to Shawomet and Gorton and 10 of his disciples were carried to Boston and condemned to hard labor, a sentence commuted to banishment in 1644. Gorton then went to England, where he obtained from the Earl of Warwick an order for the land he claimed. Returning to Rhode Island in 1648 he founded the town of Warwick, thenceforth his home and where he occasionally preached. He wrote several controversial works, the best known of which is 'Simplicite's Defense Against Seven-Headed Policy' (1646). See *JANES, 'Samuel Gorton' (1896)*.

**GÖRZ, or GORIZIA,** capital of the Austrian province or crown-land Görz and Gradisca, near the head of the Adriatic, 23 miles north-northwest of Trieste (34 miles by rail). The province, which was once part of ancient Illyria, later of the duchy of Friuli, and a separate duchy from the 11th century, came into Austrian possession in 1500. Containing a large Italian population, the territory has always been regarded (by the Italians) as part of that "Italia Irredenta" which it was

hoped to reunite with the mother country. The area is about 1,130 square miles and the population about 250,000. The town of Görz lies in a fertile plain on the left bank of the Isonzo River, on the Trieste-Nabresina-Cornons line of the Austrian Southern Railway and had a population of nearly 33,000 (mainly Italians) before the war. It possesses a fine 14th century cathedral, is the seat of an archbishop, and has important industries in manufacturing silks, cotton, leather goods, pottery, etc. Charles X of France died here in 1836 after losing his throne. On 8 April 1915, eight months after the outbreak of the European War, the Italian government formulated certain demands upon Austria-Hungary, insisting *inter alia* on the cession of the Trentino and the creation of a new eastern frontier, to include Görz and Gradisca. The rejection of the proposed terms led Italy to declare war on Austria 23 May 1915. General Cadorna, the Italian commander-in-chief, directed his initial operations toward the points of a great triangle formed by Trent, Tarvis and Görz, by which movements he proposed to keep the Austrians employed and prevent any flanking strategy while meantime striking with his main army at the Isonzo on the road to Trieste, to an advance on which the isolation and capture of Görz was a necessary prelude. After nearly 15 months of severe fighting on one of the most difficult and complex of all the European battle-grounds, the Italians succeeded in capturing Görz, no longer the pleasant city among orchards which had once made it a fashionable health resort—the Austrian Nice—but a dusty, shell-scarred landscape. The immense geographical obstacles which the Italians surmounted made the event a great achievement. The fall of Görz (Gorizia) created great enthusiasm among the Allies and especially in Italy, which declared war also on Germany 18 days later (28 Aug. 1916), although for over a year the Italians had already been fighting against German officers, soldiers and sailors. As before in Galicia during 1915, the German war command was called on to reconquer lost Austrian territory. On 24 Oct. 1917 a powerful Austro-German offensive opened against the Italian front; in four days Görz was recaptured and by the end of the year the enemy was in possession of nearly the whole of the eastern salient of Italian territory adjoining Austria. See ITALY AND THE WAR; WAR, EUROPEAN; ITALIAN CAMPAIGNS.

**GOSCHEN**, gō'shen, George Joachim, Viscount, English statesman: b. London, 10 Aug. 1831; d. Hawkhurst, Kent, 7 Feb. 1907. He was educated at Oxford, became a director of the Bank of England at the age of 27 and entered Parliament as a Liberal for the city of London in 1863, which he represented until 1880. His business ability, great debating powers and knowledge of foreign affairs, quickly gained him the respect of the House of Commons and he became vice-president of the Board of Trade in 1865, Chancellor of the duchy of Lancaster in 1866 and First Lord of the Admiralty 1871-74. With M. Joubert he went to Egypt in 1876 on behalf of the bondholders to reorganize the finances of that country and two years afterward represented Great Britain at the International Monetary Confer-

ence held in Paris. He was Ambassador extraordinary at Constantinople 1880-81. He declined a place in Mr. Gladstone's Cabinet in 1880 as he was opposed to further extension of the franchise and represented Ripon in that Parliament. In 1885 he was returned for East Edinburgh and on the conversion of Mr. Gladstone to Home Rule became one of his most strenuous opponents and is described by Gladstone as "in the main supplying brains, soul and movement to the dissenting Liberals." At the election of 1886, fought on Home Rule, he lost his seat in Edinburgh. When Lord Randolph Churchill resigned precipitately from the Chancellorship of the Exchequer in 1886, he "forgot Goschen" as a possible successor, to which he was immediately appointed. After an electoral defeat at Liverpool he was returned for the city of London, a constituency which he continued to represent until his elevation to the peerage in 1900. His chancellorship gave scope for his great abilities in finance and is remembered for his successful "conversion" of the national debt. From 1895-1900 he was First Lord of the Admiralty. In his later years he combated with all his old vigor and incisiveness Chamberlain's scheme of tariff reform and was a tower of strength to the free trade Unionists. He was the author of a standard work on "The Theory of Foreign Exchanges" (1864); of the 'Life and Times' of his grandfather, George Joachim Goschen, a famous Leipzig banker; and of 'Essays and Addresses on Economic Questions' (1905). His 'Life,' by A. R. D. Elliot, was published in two volumes in 1911. His youngest brother, Sir William Edward Goschen (q.v.) was British Ambassador at Berlin, 1908-14.

**GOSCHEN**, Sir William Edward, British Ambassador: b. 18 July 1847. He was educated at Rugby and Oxford University. He entered the diplomatic service in 1869, was attaché at Madrid, and one of the secretaries successively at Madrid (1873), Buenos Aires (1873), Paris (1875) and Rio de Janeiro (1877). He accompanied the special embassy of his brother, G. J. Goschen (afterward Viscount Goschen) to Constantinople in 1880, becoming second secretary at that capital in the following year, and secretary of the legation at Pekin (1885), Copenhagen (1888), Lisbon (1890) and Petrograd (1894). He was for a short time chargé-d'affaires at Washington; envoy extraordinary and minister plenipotentiary at Belgrade, 1898-1900, and at Copenhagen 1900-05. From 1905-08 he was Ambassador at Vienna, and from 1908 until the British declaration of war on Germany on 4 Aug. 1914, was Ambassador at Berlin. His final interview with Dr. Bethmann-Hollweg, the German Chancellor—when the latter, in reply to the British Ambassador's intimation that the violation of Belgian territory by German forces would be followed by a British declaration of war, declared that it was just for a word, "neutrality," "just for a scrap of paper," that Great Britain was going to make war on a kindred nation—is historic.

**GOSFORD**, Archibald Acheson, 2d EARL OF, British colonial governor: b. 1775; d. 1849. He was appointed governor-in-chief of Canada in 1835, and held office during the rebellions of 1837-38. He begun by endeavoring to conciliate the assembly of Lower Canada, but the

publication of his secret instructions by the lieutenant-governor of Upper Canada, in which he was empowered to make no concessions to the constitutional demands of the majority, precipitated a conflict. His instructions for the arrest of Papineau and O'Callaghan was the immediate cause of the rising in the lower province.

**GOSHAWK**, a falcon of the genus *Astur*. The goshawk proper, or "gentle falcon" (*A. palumbarius*), was a favorite bird in falconry (q.v.), and is still used for large game, as rabbits, pheasants and the geese from which it took its name. It is 21 inches in length, the crown, black, bordered on each side by a line of white, finely speckled with black; upper parts, slate, tinged with brown; legs, feathered half-way down, and, with the feet, yellow; tail-feathers with pale bands. It is to be found throughout Europe and central Asia; and it is a question whether the American goshawk (*A. atricapillus*) is really specifically different. The latter is a noble bird whose home is in the north, so that it is rarely seen south of the Canadian line except in winter, and uncommonly then. In its boldness, its marvelous power and control of flight, and its prey, it resembles our more familiar little falcons, the sharpshin and Cooper's hawk. Several other species inhabit the Orient, an Australian one being remarkable for its pure white color, with red irides.

It should be noted that the bird called "goshawk" in Scotland is the peregrine.

**GOSHEN**, the land given by Pharaoh to Jacob and his family in Egypt. Authorities differ as to the exact location of this piece of territory, but it is generally agreed that it occupied the district between the brook of Egypt and the Nile delta. Jacob's descendants lived here until the exodus. (Gen. xlv, 10; xlv, 28, 34; xlvii, 27; 1, 8; Ex. ix, 26).

**GOSHEN**, Ind., city, county-seat of Elkhart County, on the Elkhart River and on the Cleveland, Cincinnati, Chicago and Saint Louis and the Lake Shore and Michigan Southern railroads, about 25 miles southeast of South Bend and 95 miles southeast of Chicago. It is situated in a fertile agricultural section of the State. Its principal industrial establishments are flour-mills, bicycle and machine shops, woolen-mills, farm implements, condensed milk plants, steel tanks, sash and door factories, veneering and furniture shops; rubber goods, underclothing, mittens and shirts are manufactured here. The city has large lumber, coal and brick yards. Hay, grain and live stock are the chief farm products shipped from Goshen to larger markets. The public library building, city hospital, Goshen College and the high school are the principal public buildings. The mayor holds office for four years. The city owns and operates the electric-light plant and the waterworks. Pop. 8,813.

**GOSHEN**, N. Y., village, railroad junction, and one of the county-seats of Orange County, on the Erie and the Lehigh and New England railroads, 59 miles northwest of New York. Goshen was founded in 1714 and incorporated in 1809; it has municipal waterworks. It contains a hospital, a sanitarium and a public library. The manufactures include bricks, road

carts, tiles, glass, cider and foundry products, but the chief commercial interests are connected with the dairying industry, there being a considerable trade in milk, butter and cheese, which are widely celebrated for their excellence. The government is administered by a president and four trustees, elected annually. Pop. 3,081.

**GOSLING-GRASS**. See BEDSTRAW.

**GOSNOLD**, gōs'nöld, Bartholomew, English voyager to America: d. Jamestown, Va., 22 Aug. 1607. He joined Raleigh in his attempt to colonize Virginia, and after the failure of that enterprise was placed in command of an expedition fitted out at the cost of the Earl of Southampton and others for planting a settlement in New England. He sailed from Falmouth 25 March 1602, with one small vessel and a company of 32 persons, 20 of whom were colonists. Steering directly across the Atlantic, in seven weeks he reached Massachusetts Bay, first seeing land probably not far north of Nahant. Thence he turned south and landed on Cape Cod, to which he gave the name it still bears. Sailing around the promontory and stopping at the island now known as No Man's Land, but which he called Martha's Vineyard, Gosnold anchored at the mouth of Buzzard's Bay and resolved to plant his colony on an island which he called Elizabeth, and which now bears the Indian name of Cuttyhunk. The adventurers here built and fortified a house, but the hostility of the Indians, scarcity of provisions and disputes about a division of the profits, disheartened them, and the whole party returned to England, taking a valuable cargo of sassafras root, then highly esteemed as a medicine, cedar, furs and other commodities. Gosnold next turned his attention toward Virginia, and after long effort succeeded in organizing a company for colonization in that region, the heads of which were Edward Wingfield, Robert Hunt and the famous Capt. John Smith. A charter was granted them by James I, 10 April 1606, the first instrument of that nature under which the English were planted in America; and on 19 Dec. 1606 Gosnold set sail with three small vessels and an ill-assorted band of 105 adventurers, only 12 of whom were laborers and very few mechanics. After a tedious voyage, a storm having driven them into Chesapeake Bay (26 April 1607), they sailed up James River, which they named after the king, disembarked about 50 miles above its mouth and founded the settlement of Jamestown. Sickness and various disasters destroyed 50 of their number before autumn, among whom was the projector of the colony. The Massachusetts township of Gosnold, comprising the Elizabeth Islands, was named in his honor.

**GOSPELS**, Apocryphal. These are sometimes called the uncanonical Gospels because they were not included in the New Testament Canon. They are also called Pseudepigraphal Gospels, because of the lack of authenticity for their contents. Some are probably lost entirely and others have descended to us in fragments only. James Moffat in his superb article "Gospels—Uncanonical" in Hastings's Dictionary of the Apostolic Church (Vol. I, pp. 478-506) classifies these writings under three heads: (1) Gospels relating to the birth and infancy of Jesus; (2) General Gospels

similar to the synoptics; (3) Gospels of the passion and resurrection. In a general way we shall follow his order.

**The Protevangelion of James.**—The oldest manuscript known dates back to the 10th century in the Greek. It was first published by Bibliander at Basel in 1552 in a Latin version by William Postell, a traveler who had found it in current use in some of the Eastern churches. One or two modern scholars hold that it had a Semitic original from which the birth stories of Matthew and Luke are taken. The contents of the Gospel deal with the lament of the priest Joachim and Anna that they have no child, the subsequent birth of Mary, the selection of Joseph and his marriage to Mary; their journey to Bethlehem; the birth of Jesus, the flight into Egypt and the murder of Zechariah, the High Priest.

**The Gospel of Thomas, the Israelite.**—The oldest manuscripts of this gospel are of the 14th or 15th century. Zahn dates the original gospel early in the 2d century, but scholars generally place it at a much later date. It is thought that it had its origin among the Gnostics or Manichaeans. The Gospel gives the story of Jesus learning the Greek alphabet and other stories of the childhood of Jesus. Some of its materials were used in the Gospel of the pseudo-Matthew and the Arabic Gospel of the Infancy.

**The Gospel of Pseudo-Matthew.**—So named by Tischendorf, the first editor of the Latin Text. It was paraphrased by Hrotswitha, abbess of Gandersheim in the 10th century, in Latin hexameters. The details regarding the flight into Egypt are very full. It also contains the incident of the taming of the lions.

**The History of Joseph, the Carpenter.**—Was preserved in the East in an Arabic translation first made known in Europe by Isidore de Isolanis at the commencement of the 16th century. It was not published until 1722 when Wallin printed it from an Arabic manuscript of the 13th century accompanied by a Latin translation. It claims to be the story told by Jesus to the disciples on the Mount of Olives. It is of Egyptian origin not earlier than the 4th century. There are also four Sahidic fragments of other Nativity Gospels.

Among the general gospels there are four called "Jewish Christian Gospels" because they originate from that source. They are: The Gospel of the Hebrews, The Gospel of the Nazarenes, the Gospel of the Twelve and the Gospel of the Ebionites.

**The Gospel of the Egyptians.**—So called because it circulated among them; is referred to by Clement of Alexandria, Origen and Epiphanius. Its origin has been ascribed to the Essenes with a very early date.

**The Gospel of Peter.**—Of very early origin. It is said to have been used "either for private reading or in public worship, by the Church at Rhossus on the coast of Syria not far from Antioch in the last quarter of the 2d century." It may have been of Gnostic origin as there are some elements in it that seem to be Gnostic in character.

**The Gospel of Basilides.**—Of Alexandrian origin, the group claiming to have the authority of Peter's interpreter Gloucias in matters of doctrine. It was composed before

the middle of the 2d century. It is referred to by Origen. By some critics it is conjectured that Basilides prepared an edition of the Gospel of Luke for his own purposes.

**The Gospel of Marcion.**—An edition of Luke prepared by Marcion for those who like himself were antagonistic to Judaism.

**The Gospel of Apelles, the disciple of Marcion,** is only a conjecture. The text is not known. The thought that such a Gospel is in existence is based on a single passage in Epiphanius.

**The Gospel of the Naassenes,** a Gnostic sect, is only known through several quotations found in the *Philosophoumena* of Hippolytus.

**Oxyrhynchus Fragments.**—The excavations in Egypt in recent years have yielded some remarkable results in the discovery of various early Logia of Jesus, edited and published by Grenfell and Hunt in 1897, 1907 and 1911. In 1896 Forbes Robinson published several Sahidic fragments of importance, but not earlier than the 3d century. See AGRAPHA.

The Gospels dealing with the Passion and Resurrection are nine in number.

**The Gospel of Philip.**—Exists in a mere fragment preserved by Epiphanius. It is referred to in the 'Pistis Sophia.' It was in use by an Egyptian Gnostic sect during the 4th century. It probably had its origin in the last quarter of the 2d century.

**The Gospel of Matthias.**—Matthias was elected an apostle after the Resurrection and it is assumed that he received secret revelations from Jesus. There are no quotations from the Gospel, but Clement of Alexandria quotes from the 'Traditions of Matthias.' According to Hippolytus the 'Traditions' seem to have originated with Basilides and Isidore.

**The Gospel of Mary.**—Exists in three fragments only, one of which is in Coptic. It had its origin among the Barbelo Gnostics whom Ireneus refuted.

**The Gospel of Bartholomew.**—Exists in Latin, Greek and Coptic fragments, some of them as early as the 9th century. According to the fragments Jesus allows Bartholomew to see and interrogate Satan. He is 600 cubits high and 300 broad and is guarded by 6,064 angels. Bartholomew kicks and infuriates Satan and learns from him some of his secrets for tempting men.

**The Gospel of Nicodemus.**—Is sometimes called the 'Acts of Pilate.' In recent years it had been very widely circulated. It gives an account by a supposed eyewitness of the trial and death of Christ with many fabulous additions. It is probably not older than the 4th or 5th century.

**The Gospel of Gamaliel.**—Is largely conjectural as to its existence. Various fragments have been considered to belong to it, but without certain proof.

**The Gospel of Perfection.**—Originated among the Ophite Gnostics according to Epiphanius. It is alluded to in the 'Pistis Sophia.' Further than this neither details nor quotations are preserved for us.

**The Gospel of Eve.**—Of Gnostic origin and Epiphanius preserves the only quotations from it that have come down to our day.

**The Gospel of Judas Iscariot.**—Composed by Gnostic Cainites in the 2d century. It

represents Judas as having a very avaricious wife who encouraged him to steal from the Apostolic purse for her benefit. At her instigation he finally betrayed his Master in order that he might again minister to her greed.

In addition to these gospels there are a number of Coptic unclassified fragments dealing with the Passion and Resurrection which are of undoubted early origin, in some cases a near approach to Gospel quotations. In fact they may be passages carelessly quoted from the canonical Gospels. The most famous fragment was a bit of papyrus discovered at Fayum. It is of the 3d century and was first published by Gustav Bickell in 1886.

In addition to all the above documents, the following are mentioned by the early fathers of the Church. There are no fragments or quotations from them in existence known to the scholars of this day: 'The Acts of Andrew'; 'The Gospel of Andrew'; 'The Gospel According to the Twelve Apostles'; 'The Gospel of Barnabas'; 'The Gospel of Cerinthus'; 'The Revelation of Cerinthus'; 'Epistle of Christ to Peter and Paul'; 'Gospel of the Encratites'; 'The Book of the Helkasaites'; 'The Gospel of Hesychius'; 'The Book of James'; 'The Gospel of Jude'; 'The Revelation of Stephen'; 'The Gospel of the Scythians'; 'The Gospel of Thaddeus'; 'The Gospel of Truth' in use among the Valentinians, and 'The Gospel of Valentinus,' besides many general Acts of the Apostles and specific acts of individual apostles that may have had some bearing on the gospel narratives.

SAMUEL G. AYRES,  
Garrett Biblical Institute.

**GOSPELS, The.** The name Gospel is directly derived from the AS *gōdspell* (= God-message), but ultimately from the earlier form *gōd spel* (= good message), a phrase probably coined to represent, as it does very exactly, the Gr. *εὐαγγέλιον*. The Gospels are four brief books of the New Testament which present to the reader something of the life, teachings, death and resurrection of Jesus Christ. They are often called so many 'lives of Christ,' but this is an error as the main interest and intent is in none primarily historical or biographical. They are in every case writings with a purpose, viz., to present to believers in Jesus such facts in relation to him as seemed to the writer most important and useful. The author of the third Gospel definitely asserts that he wrote to give to his first reader certainty as to the matters in regard to which there had been oral instruction (i. 4); and the fourth Gospel had for its avowed and manifest object to set forth the deity of Jesus (xx, 31).

The first use of the term Gospel was not in reference to written documents. It rather applied to the message of truth and life brought by Jesus Christ (Rom. i, 1), and it is nowhere in the New Testament employed in reference to the books now called Gospels. Instead we find in Justin Martyr's writings what seems to have been the name first used for these books, 'Memoirs,' but in the second half of the 2d century the use of the title later universally employed may be distinctly traced. The form of the title uniformly prefixed to these books reminds us of the earlier signification of the word. The phrase 'The Gospel

according to Matthew,' 'according to Mark,' implies to be sure an assertion of authorship, but the thought is not of so many distinct Gospels, but rather of the one and single Gospel as variously presented by the several evangelists. In a similar way there are found in the Fathers references to the 'threefold' and 'fourfold' Gospel. When, however, the books were once called Gospels, the name passed into uniform and permanent use. In the present article such facts will be presented as relate to all the Gospels or to several of them, while for such considerations as apply to a single Gospel by itself one should consult the article bearing the name of its author.

**The Synoptic Gospels.**—Practically from the beginning it has been recognized that there are peculiar resemblances among the first three Gospels which require us to group them together over against the fourth Gospel which is in many ways markedly distinct from the others. The name 'Synoptic' is commonly applied to Matthew, Mark and Luke because they agree in giving a 'common view' of the facts about Jesus, which is implied in the Greek word *συνωπτικός* though the English derivative, 'synopsis,' has come to have a very different signification. While Matthew and Luke contain large additions to the stock of material common to all three Synoptics, and in these additions vary markedly from each other, yet comparison readily shows that the framework as to place and time is common to all three; that many events and some teachings are related in all; and that there is often a striking similarity in the language employed, a resemblance so exact that, for example, the same parenthetic explanation uniformly interrupts the report of the words spoken in connection with the cure of the paralytic. These resemblances are so many and so marked that the idea that the first three Gospels are so many independent compositions is now rejected by scholars with practical unanimity. On the other hand, there are also striking divergences and diversities; not only are there facts and teachings peculiar to each of the Gospels, but also the flow of the narrative common to all three is often interrupted by most noticeable variations. The fact of the simultaneous existence of such remarkable agreements and disagreements has given rise to the so-called 'synoptic problem,' which for more than a century has occupied so large a place in New Testament criticism with the endeavor to find a hypothesis which will plausibly explain the phenomena.

The principal solutions proposed have been: (1) that of an oral gospel underlying all three; (2) of dependence of one upon another or others; (3) of a written source or sources.

1. The argument in favor of the oral gospel hypothesis is simple and not without a certain plausibility. It will be admitted by all that the gospel story must have been first transmitted orally, and we have only to think of this oral transmission in a certain way to find a sufficient solution for the problem. But when we come to inquire how there could have been such oral transmission as would provide at once for the agreements and the differences, the solution seems less plausible. Further, in the prologue to Luke we find a statement that already there had come to be numerous arrangements of the gospel material, and these arrange-

ments can be thought of only as in written form. Accordingly the theory that the oral Gospel explains the phenomena in question is set aside to-day almost unanimously.

2. The dependence theories have been so many that it would seem that every combination possible had been urged. Only two of the most important can here be mentioned. (a) As there is very little in Mark which cannot be found in Matthew or Luke, if not indeed in both, it has been held that Mark was only a copyist and abbreviator of the other two. But this does not commend itself on further consideration. There is some material which is peculiar to Mark, and this possesses such tokens of originality, such freshness and picturesqueness, that it does not seem possible that the author could have been merely a copyist. Nor is it credible that a competent copyist could have neglected and thrown aside so much interesting and important material as is found in Matthew and Luke beyond what is paralleled in Mark. (b) Only one other form of the dependence hypothesis has sufficient plausibility to deserve even mention here. It has been held by some that Mark was used by Matthew, and then that both Mark and Matthew were employed in the construction of Luke. But unless supplemented from the theory of sources this explanation fails to explain where the material in Matthew, additional to Mark, was obtained, and, in turn, how the writer of Luke made such additions to the Gospels which lay before him.

3. For a long time now the theory that the evangelists used written sources as a basis for their work has more and more occupied the field, so that the points now chiefly argued are the number and character of the sources employed. It is very widely accepted that the principal source of Matthew and Luke is found most completely in Mark, if that Gospel was not indeed used by them in its present form. While the latter hypothesis is often put forward or implied, it is doubtful if those who accept it appreciate the serious difficulties which beset this view. On the one hand, there is much in Mark which it seems incredible that the author of Matthew, and especially Luke with his desire for completeness and his keen sense of literary values, could have overlooked, as where Mark is fuller than Matthew or Luke, the additions are usually striking; on the other hand, the second Gospel itself shows distinct traces of being more than an accumulation of material, of being in its present form the work of one who edited the material which he had collected and combined it into a well-ordered literary whole. Hence many scholars hold that the common basis of all the Synoptic Gospels is a source, which is not, to be sure, our present Mark, but which is best reproduced in that work and with the least addition of other material, and so may well be called the Marcan source, or, as some prefer to style it, "Ur-Markus," that is, the original source of Mark. This source gave the local and chronological framework for all the Synoptics, and, so far as it went, provided each and all of them with much of their material. How it arose, when and where, who was the author, was it John Mark, or was he the author who on the basis of these notes, together with a limited amount of other

material, wrought out the second Gospel, all these questions remain for future investigation, perhaps will long remain matter for speculation. (See article MARK, GOSPEL OF). This same source underlies Matthew and Luke no less than Mark, although it is regarded by many as almost certain that the other evangelists did not possess the "Marcan source" in the same form in which it appears in the second Gospel. The origin of these variations and their extent is likely, however, to remain problematical. One of the most striking theories is that the evangelist Mark himself issued no less than three editions of his work, the first having been put out at Jerusalem, which was utilized by Luke who became acquainted with it during his stay at Jerusalem or Caesarea; the second at Alexandria which edition Matthew used in the first Gospel, and the third and final edition at Rome in the form which remains our second Gospel.

A statement from Papias, who lived during the first half of the 2d century, has been preserved to the effect that "Matthew composed the Logia in the Hebrew language" (more correctly in modern speech in Aramaic). Late criticism very largely makes this document the second main source to be traced in both Matthew and Luke, though scholars differ widely as to the contents and even as to the character of the document. Even the name given to it varies, as German scholars prefer to style it "Q" (from Quelle). So much discourse material in both Matthew and Luke may plausibly be ascribed to this source that not a few have been inclined to consider that it was merely a collection of the discourses of Jesus, an edition of his sermons, as it were. But as the Greek word "Logia" means "Oracles," rather than "Discourses," it may also have contained narrative, at least enough to give the setting of the speeches, perhaps more. Various attempts have been made not only roughly to indicate its probable scope and nature, but even, by combining what in Matthew and Luke may plausibly be attributed to it, to reproduce it supposedly much as it was. But when we remember that if we did not have Mark, but only Matthew and Luke, it would have been impossible to reproduce with accuracy the Marcan source on which both are based, it may well seem hopeless, if not absurd, to claim any certainty for proposed reproductions of the "Logia." It has repeatedly been suggested, and with much plausibility, that the first Gospel was attributed to the Apostle Matthew because it was he who was the author of the collection of Discourses of Jesus and other matter relating to him which is the source of so much of that Gospel. It is indeed held by most that, except the first two chapters, practically the whole of Matthew may be referred to one or the other of the Marcan or "Logia" sources. See article MATTHEW, GOSPEL OF.

While attempts to find some traces of the use of the "Logia" in Mark have not been received with favor, it is plain that this source was largely employed in the composition of Luke. There is one marked difference to be noted, that in Luke the attempt is made to give the sayings of Jesus in their original setting, while in Matthew they are collected into long discourses as if spoken continuously. The "Logia" may of course have been somewhat

modified in transmission, so that the document did not lie in identical form before the authors of the first and third Gospels, and it should also be remembered that, like most who speak much, Jesus may often have repeated the great lessons which he wished to enforce, but a difference between the evangelists in their manner of treating their common material may also be accepted. Luke must also have had other sources of information than the two great sources which have been discussed, which would be quite in keeping with his claim (i, 3) of wide and thorough investigation. See article LUKE, GOSPEL OF.

It is now generally recognized that the "Two Document" theory gives plausible answer to most of the questions involved in the "Synoptic Problem," and consequently scholars are resting on it with increasing unanimity and confidence. At the same time there is no such general agreement as to details in the application of the theory. (1) While the majority would say that Mark in its present form, or a document practically indistinguishable from it, was used in the composition of the first and third Gospels, yet there are such difficulties in the way of this view it has been strongly urged that the authors of Matthew and Luke must have had access to the Marcan material only in forms which had come in the process of transmission to vary widely from each other, or even, as has already been noted, that we must conceive that Mark issued his Gospel in no less than three quite variant editions. (2) It is still further asserted that the Marcan source cannot be explained wholly independently of Q, but that some traces of the latter should be recognized as existent in the former. (3) This suggests, again, the uncertainty which still prevails as to the extent of Q, and even as to its character, that is, as to whether it consisted exclusively of discourse material, or included narrative matter as well. Such uncertainty in regard to these points at least still reigns that it may perhaps be doubted whether, even if, as seems most probable, the "Two Document" theory should permanently maintain itself, it is also reasonable to expect that it will be possible, with the material which we possess, to find satisfactory answer to the questions which arise in its application. Uncertainty as to the exact form in which the sources were at hand for the composition especially of Matthew and Luke is increased by the recognition of the fact, on which emphasis has lately been freshly laid, that the authors of the Gospels were not mere copyists who felt bound exactly and without modification of form to reproduce all the material which was accessible to them, their work consisting merely in piecing it together, but that they were, rather, authors who without doing injustice to their materials, might and very possibly actually did select, arrange and even, to some extent at least, rewrite them in accordance with their own purposes. Thus, for example, the fivefold arrangement of the discourse material in Matthew might be due, not to some source which lay before him, but to the final author himself.

After the acceptance of the "Two Document" theory, question still remains as to the ultimate origin of a certain amount of material, relatively small on the whole, which seems

to some to stand outside the natural scope of both Q and the Marcan source. One example is the apocalyptic discourse of Jesus, which, to be sure, is found in all the Synoptics. The criticism which separates this from the Marcan source is, however, wholly subjective and the assumption that Jesus cannot have uttered such a discourse has been fairly styled "purely gratuitous." As to the "Infancy" chapters in Matthew and Luke the case stands quite differently and for this material special sources must be sought. It has been suggested with great plausibility that the matter in this section of Luke was obtained from the daughters of Philip the evangelist, or, even more plausibly still, from Joanna, the wife of Chuza, Herod's steward. In the latter case it may reasonably be believed that the large section of matter in Luke without parallel elsewhere (Lk. ix, 51-xviii, 14) was due to the same source.

**The Relation of the Fourth Gospel to the Other Three.**—Most of the difficulties connected with the fourth Gospel relate simply to the book taken by itself, and the discussion of them has no place in an article concerned only with what belongs to all the Gospels or to several of them (see article JOHN, GOSPEL OF). One important and difficult problem, however, grows out of the contrast which appears in many ways between the fourth Gospel (John) and the other three. Their unlikeness is so great that it is scarcely surprising that some have felt that they were positively inconsistent, that if the Synoptics are accepted as authentic, the unauthenticity of John must follow. But on more careful study many of the superficial unlikenesses lose their apparent significance. For example, the mention of three passovers in John and of but one in the other Gospels might seem to give an irreconcilable contradiction as to the length of the ministry of Jesus, but it is very possible that the Synoptics simply failed to mention the occurrence of passovers not connected with the events which they described, and there is good reason to hold that the ministry as recorded in those Gospels requires a duration of much more than a year. Most of the events in the active ministry of Jesus as recorded in John occurred in Judea, while the scene of the synoptic reports is laid in Galilee, but the ministry is not so reported by either as to forbid the acceptance of the other. It is needless to multiply examples. Some difficulties remain unsolved, as to find in harmony with the synoptic reports a place for the raising of Lazarus, but it is to be remembered that both sets of reports are exceedingly fragmentary and that fuller information, could we obtain it, might relieve the situation. If it is found impossible to reconcile the statements of John and the Synoptics as to the day of the crucifixion, whether the 14th or the 15th of the month (not all critics are sure that there is a clear contradiction), it remains to be settled whether the statements in John may not have been written with the definite purpose to correct the synoptic reports. While it is now recognized that "harmonizing," i.e., the fitting together in their order of all the events recorded, is less easy and certain than was formerly thought, because of the fragmentary character of all the reports, yet the same fragmentariness makes it less easy to assert with

confidence that John and the Synoptic Gospels are contradictory or even inconsistent.

**Grouping of the Four Gospels.**—It is plain from the prologue of Luke that there were in existence at that time various narratives in relation to Jesus which presumably had gained some currency. To say nothing of the Apocryphal Gospels, most of which are certainly much later, it appears that the so-called "Gospel of the Hebrews" and "Gospel of Peter" found considerable acceptance for some time. Gradually, however, these other narratives were set aside in favor of the present fourfold gospel. This can scarcely have taken place in the 1st century, for John cannot have been composed till nearly the end of the century. But by the middle of the 2d century the "Diatessaron" of Tatian, a single narrative formed by combining the four which we now have, shows that the grouping was already a fact, and by implication that it had been accomplished long enough so that it was a familiar and accepted fact. The testimony of Papias shows that long before the middle of the century this process was taking place in Asia Minor, if it had not been already accomplished. This fact may be sufficient to justify that it was in Asia Minor and perhaps in Ephesus itself whither the first three gospels had been carried and where the fourth was written, that there came about this grouping of narratives which has given to the Christian Church its permanently fourfold gospel. While the accepted group of gospels has always consisted of the same four books, it is interesting to note that the order in which the books stand in the MSS. varies greatly. Almost every possible order of books is to be found, and the order, Matthew, John, Luke, Mark, is found only less often than the order which finally prevailed.

**Historicity of the Gospels.**—Very positive assertions were formerly often to be met with as to the unhistorical character of the Gospels, and every variation in statement was urged as a proof of their untrustworthiness. But later and more careful criticism shows that the authors were honestly trying to set forth facts as they knew them, and the discovery of the sources which underlie them increases their trustworthiness. Not only have the commonly accepted dates of the Synoptics been pushed back to points far earlier than the dates proposed by older scholars, but the sources carry us back much earlier still. The "Marcan Source" and the "Logia" cannot be separated by 30 years from the events which they record, and may not be more than 15 or 20 years from them. This fact makes the growth of myth and legend practically impossible, and shows that many eyewitnesses of the ministry of Jesus were still living at the time of the composition of the "sources," on which the historicity of the Synoptic Gospels largely, but by no means exclusively, depends. That our Gospels embody so fully and exactly these early sources goes far to guarantee their trustworthiness.

DAVID FOSTER ESTES,  
*Professor of New Testament Interpretation,  
Colgate University.*

**GOSS, Charles Frederic**, American Presbyterian clergyman: b. Meridian, N. Y., 14 June 1852. He was graduated from Hamilton College in 1873, from the Auburn Theological Seminary in 1876 and was at first a home missionary and besides briefer settlements was pastor of 'The Moody Church' in Chicago for five years and the Avondale Presbyterian Church in Cincinnati for 19 years, retiring in 1913. He received his D.D. from his alma mater; was instructor of biblical literature in the Cincinnati university; minister in residence in Auburn Theological Seminary in 1912; lectured extensively; wrote for many papers and published 'The Optimist' (1898); 'The Philoplist' (1898); 'The Redemption of David Corson' (1900); 'The Loom of Life' (1902); 'Little Saint Sunshine' (1902); 'Hits and Misses' (1899); 'Just a Minute' (1904); 'A Life of D. L. Moody', and a 'History of Cincinnati' (1912).

**GOSS, Isham J. M.**, American eclectic physician and author: b. Oglethorpe County, Ga., 16 Aug. 1819; d. Marietta, Ga., 25 Feb. 1896. He was graduated at Emory College, Ga., and in 1844 in medicine from the medical department of the University of Georgia. For 14 years he followed the practice of the regular or allopathic profession, when he was converted to American Eclecticism and became a leader of that school in the South. Several eclectic colleges conferred upon him the honorary degree of doctor of medicine. In 1868 he filled the chair of practice in the Philadelphia Medical University and in 1877 the chair of materia medica and therapeutics in the Georgia Eclectic Medical College, reorganized that year. He wrote 'Materia Medica' (1877); and 'Theory and Practice of Medicine' (1882).

**GOSS, Warren Lee**, American writer: b. Brewster, Mass., 19 Aug. 1835. He studied at the Harvard Law School, served in the Civil War, first in the United States engineers and later in the 2d Massachusetts Volunteers; was president and later historian of the National Union of ex-Prisoners of War; was for two years national patriotic instructor of the Grand Army of the Republic. He has been active as editor, magazine writer and author of such volumes as 'The Soldier's Story of Captivity at Andersonville' (1866); 'Recollections of a Private' (1890, the first seven chapters previously published in the *Century Magazine*), and several such volumes as 'Jed, a Boy's Adventures in the Army,' and later, 'Life of Grant for Boys and Girls' (1911), and 'Boy's Life of General Sheridan' (1913).

**GOSSAN.** See SECONDARY ENRICHMENT.

**GOSSE, gōs, Edmund William**, English literary critic and poet: b. London, 21 Sept. 1849. From 1875-1904 he was (translator to the Board of Trade, and since 1904 has been

librarian to the House of Lords. In 1884-85 he lectured in the United States. He has made a special study of Scandinavian literature, and published 'Studies in the Literature of Northern Europe' (1879). Other works of his are 'Life of Gray' (1882); 'Seventeenth Century Studies' (1883); 'From Shakespeare to Pope' (1885); 'Life of Congreve' (1888); 'History of Eighteenth Century Literature' (1890); 'Life of Philip Henry Gosse, Naturalist' (1890); 'Gossip in a Library' (1891); 'Questions at Issue' (1893); 'The Jacobean Poets' (1894); 'History of Modern English Literature' (1897); 'Coventry Patmore' (1904); 'Father and Son' (1907), a delightful piece of autobiography which was crowned by the French Academy in 1913; 'Portraits and Studies' (1912); 'Collected Essays' (5 vols., 1913). He published his 'Collected Poems' in 1896.

**GOSSSELIN**, gōs-lān', **Auguste Honoré**, French Canadian historian: b. Saint Charles de Bellechasse, province of Quebec, 29 Dec. 1843. He was educated at Quebec Seminary and Laval University, was ordained to the priesthood in 1866, and has held various clerical appointments. He is the author of 'La Vie de Mgr. de Laval' (1890); 'Les Normands au Canada' (1892-94); 'Mgr. de St. Valier et Son Temps' (1900); 'Jean Nicolet et le Canada de Son Temps' (1905).

**GOSSEN**, gōs-s'en, **Herman Heinrich**, German economist: b. Duren, 1810; d. 1858. His father and grandfather were government officials, and he followed the same career, with a want of success which is attributed to his predilection for abstract studies. He is described as amiable and unpractical. He retired into private life in 1847, occupying himself first with a project of universal insurance, afterward with his book entitled 'Entwicklung der Gesetze des menschlichen Verkehrs und der darausfließenden Regeln für menschliches Handeln' (Brunswick 1854). This work which had been generally overlooked even in Germany, and is not mentioned in Roscher's 'History,' was brought to light by Professor Adamson, and an account of it was given by Jevons in the preface to the second edition of his 'Theory of Political Economy.' It was extremely rare and was reprinted at Berlin in 1889. The work is an attempt to found economics on a mathematical basis, and the author regarded his services in the reform of the method of the science as similar to those of Copernicus in astronomy. Gossen's book contains two elements of unequal value; a somewhat narrow and pedantic application of utilitarian philosophy to politics and ethics, and a very original formulation of the principle of final utility in economics. In general it may be said that Gossen is guilty of a fallacy to which mathematical economists are peculiarly liable; what may be called the 'illicit process' from the principle of utility in economics to utilitarianism in the philosophy of conduct. Gossen's strength lay only in the more mechanical portions of the mathematical theory. He was a man of one idea; but that was an immortal one. Consult *Journal des Économistes* (4th ser., Vol. XXX, 1885, p. 68); Walras, Léon, 'Un Économiste Inconnu.'

**GOSSYPIUM**. See **COTTON**.

**GOSSYPIUM PHOSPHO**, a valuable fertilizer composed of a mixture of cotton-seed meal and pulverized phosphate rock. The making of this fertilizer is an important industry in the South, where one factory has an output of 15,000 tons annually. The phosphate rock, which comes from South Carolina, passes through huge mills of great power, and is ground into a fine powder, after which it is carried through draft pipes to the top of a six-story tower, and there undergoes a process of refinement. The rich yellow meal which comes from the cotton-seed oil-mills is mixed with the ground phosphate, and adds materially to its strength as a fertilizer. The mixture thus obtained is collected into immense bins, and treated with sulphuric acid, assuming a semi-liquid state. It is then called gossypium phospho.

**GÖSTA BERLING**, yēs'tā bār'ling, **The Story of**, a novel by Selma Lagerlöf, appeared about Christmas-time 1891. In the summer of 1890 a Swedish magazine, the *Idun*, had offered a prize for the best novel of a certain length. Selma Lagerlöf entered the contest with a few chapters from 'Gösta Berling,' a story which was then beginning to take shape in her mind, and won the prize. In 'The Story of Gösta Berling' Selma Lagerlöf is a romanticist and represents a reaction against the realism which prevailed at the time. As a child she had absorbed the folk-tales of her surroundings, and later on in life it occurred to her like a lightning flash that it was her particular mission to give these stories expression. 'The Story of Gösta Berling' has been called the "prose epic of Swedish country life." The scene is laid on the shores of Lake Fryken (Lake Löven in the story) in Värmland. The hero, Gösta Berling, is a deposed minister, who has been saved by the mistress of Ekby from freezing to death and thereupon becomes one of her pensioners in the manor at Ekby. As the pensioners finally get power in their own hands, they manage the property as they themselves see fit and their lives are filled with many wild adventures. Gösta Berling is the leading spirit, the poet, the charming personality among a band of revelers. But before the story ends, Gösta Berling is redeemed, and even the old mistress of Ekby is permitted to come to her old home to die. In 'The Story of Gösta Berling,' as in her other works, the authoress shows a marvelous simplicity of style. Everything she touches quickens with new life and takes on a deeper meaning. Her imagination and her idealism lend a charm to the story which makes it a source of keen enjoyment.

JOSEPH ALEXIS.

**GOTHA**, Almanach de. See **ALMANAC**.

**GOTHAM**, a parish of Nottinghamshire, England, seven miles southwest of Nottingham. Pop. (1911) 1,086. The people obtained a reputation for stupidity and simplicity, and the satirical appellation of "the wise men of Gotham," owing to the tradition that King John journeyed through the town for the purpose of selecting a site for a palace, and the inhabitants, not wishing to be burdened with the expenses of a royal residence, devised the plan of appearing stupid and foolish during the visit of his majesty. King John left in dis-

gust; whereupon the Gothamites said: "More fools pass through than live in Gotham." The name Gotham is applied also to the city of New York. Thus used it appeared first in 'Salmagundi,' by Washington Irving and James K. Paulding. The authors may have had in mind the worldly wisdom of the city's inhabitants.

**GOTHENBURG** (göt'en-boorg) **SYSTEM**, a system of regulating the sale of spirituous liquors which had its origin in 1865, in Gothenburg, Sweden. A company is granted a monopoly of the retail and bar sale of those liquors in the town (brandy is the national drink); but the sale of beer and wine is not included in the monopoly. Managers at fixed salaries are placed in the public houses, part of whose duty it is to provide food at cheap rates and who get the profits realized on soft drinks. After paying dividends to the shareholders (not exceeding 6 per cent) the additional profits are divided between the municipality and the central government. In Norway the profits above 5 per cent are applied chiefly to a national fund and to objects of public utility other than those supported out of the rates. In addition to a number of towns in Sweden, Norway and Finland, it has been introduced in certain towns and districts in Scotland and England. In the places where the system has been tried it has been successful in limiting the consumption and in lessening the number of licenses; it has tended to ensure the sale of purer liquors; it has divorced politics from liquor and eliminated the element of private profit; but the temptation to increase revenue has in some places not promoted temperance, and the association of the municipality with liquor has made the system obnoxious to the great body of temperance opinion.

A modified Gothenburg licensing system was introduced into South Carolina in 1892, when the sale of liquor became a State monopoly and its retail was placed in the hands of salaried dispensers. The system led to intense dissatisfaction; charges of corruption were leveled at its administration; and in 1907 it was abandoned. Consult Gordon, 'The Breakdown of the Gothenburg System' (New York 1911); Gould, E. R. L., 'The Gothenburg System of Liquor Licensing' (Washington 1893); Pratt, 'Licensing and Temperance in Sweden, Norway and Denmark' (London 1907); Rowntree and Sherwell, 'Gothenburg Experiments and Public House Trusts' (London 1901).

**GOTHIA**, the empire of the Visigoths, or Western Goths, which extended over Spain and included Septimania, territory held in Provence; Gaul, and the cities of Carcassonne, Narbonne and Nîmes. See **GOTHS**; **VISIGOTHS**.

**GOTHIC ARCHITECTURE**. The name "Gothic" applied to a style of architecture is a misnomer, since the Goths never created any architecture of their own. It has, however, come into general use to designate comprehensively the mediæval architecture of northern and western Europe of the period from 1150 to 1500, because in the 16th century the Renaissance writers and artists looked upon all mediæval architecture as "barbarous" because different from antique classical models, and at-

tributed its origin to the Goths who overran large areas in Europe in the "Dark Ages." The name thus became too firmly fixed to be displaced, in spite of its unscientific origin.

**Definition**.—While some writers deny that any one name can properly be applied to so vast a body of architecture as is commonly included under the name of Gothic, the following definition of the term is sufficiently comprehensive to cover the styles to which it is commonly applied and sufficiently specific to exclude all others: Gothic architecture is that style which grew up in northern and western Europe, from germinant principles previously developed in the so-called Romanesque styles, taking on new forms and extended applications in progressive solutions of the problem of the construction and decoration of church edifices vaulted throughout in stone, especially of churches having three or five aisles whereof the central one was loftier than the others and was lighted by a clearstory. The style thus developed, first of all and to the highest perfection in northern France, was varied in the several countries to which it spread, and its forms were applied to a great variety of buildings, both religious and secular. Its fundamental structural principles were the employment of ribbed groined vaults to cover the several aisles, the concentration of loads and thrusts at particular points, and the special disposition of masonry at those points to support the loads and resist the thrusts, with a corresponding reduction of the massiveness of walls elsewhere. The controlling principle of the design was the frank expression everywhere of the actual structural framework. The decoration was of two kinds: first, the adornment of the structural members by moldings and carving; secondly, pictorial, didactic and symbolic adornment by means of sculpture, stained glass and painting. Applied ornament in stucco, marble sheathing and mosaic is wholly wanting, except in Italy. The characteristic features developed in this architecture were the ribbed vault, the flying arch, buttress and pinnacle, the pointed arch, clustered piers, traceried windows and towers with spires. As the style spread to regions where timber was abundant, scientifically designed ceiling-roofs of wood were often substituted for stone vaults, and in other regions brick was used for walls and vaults instead of stone; but even in these the concentration of strains, the frank expression of the structure and the employment of the characteristic forms and decoration of the style justify their inclusion under the general name of Gothic.

**Historic Development**.—By the middle of the 12th century the monastic builders of northern France had developed the ribbed groined vault, of both the four-part and six-part type (see **VAULTING**) sufficiently to enable them to vault successfully the high, broad central aisles of a remarkable series of large and lofty churches with clearstories; they had begun to use the pointed arch with increasing frequency, and the flying arch and buttress, in a somewhat crude form, had appeared in a number of churches. But the masonry was still massive, the windows small, and the dead weight of the structure throughout was the main reliance for its stability. What distinguishes the early Gothic buildings is the systematic effort to

2 Gloucester Cathedral, Choir

divide the loads from the thrusts, and to concentrate the resistance to the latter in deep buttresses against the outside walls, transmitting the vault-thrusts to these by flying half-arches across the intervening aisle-roofs. The clearstory walls and the piers and arches carrying them could then be made much lighter, and the side-aisle walls between the buttresses reduced to mere screen walls. This lightening of the walls was greatly helped by increasing the size of the windows, which increase was further stimulated by the development of stained glass, and tracery was devised in order to divide these larger windows into narrower windows or "lights," because wide areas of stained glass are impracticable and unsafe. In this scientific development of structural lightness the pointed arch was found to be the most flexible and adaptable form, and soon displaced completely the round arch, while the greater lightness of construction without loss of stability made possible a marked increase of height. Accompanying all this progress in what may be called the engineering of church building there was at least an equal advance in artistic taste, in elegance of execution, in refinement of detail, in decoration by figure-sculpture, ornamental carving and stained glass, and in the design of the tracery of the great window-openings. In the carving the classic and Byzantine traditions of the Romanesque period were rapidly outgrown; suggestions of ornamental form were drawn from nature, especially from the foliage of common plants, and religious symbolism added a world of new conceptions in carved stone, in which beasts, birds, human figures, monsters and grotesques, ingeniously and often humorously worked into capitals, corbels, moldings and other details, served at once an allegorical and decorative purpose. The portals of churches were made deep and vast and peopled with saints, angels, apostles and martyrs, and the windows glowed with brilliant pictures of Biblical scenes and religious allegories. This transformation of ecclesiastical architecture was effected mainly in the building of great cathedral churches. During the second half of the 12th century the French bishops acquired much of the power and prestige previously held by the abbots of the great Benedictine monasteries, and attracted to their aid the people especially of the episcopal cities, where the new cathedrals arose, not merely as bishops' churches but also as civic enterprises, as great peoples' churches, rivaling and surpassing even such noble abbeys as that of Saint Denis. Between 1130 and 1200 the cathedrals of Bayeux, Bayonne, Laon, Lisieux, Noyon, Poitiers, Senlis and Soissons were entirely rebuilt, or their rebuilding begun; while wholly new cathedrals were begun at Bourges, Auxerre, Coutances, Evreux, Reims and Rouen were begun, besides many fine parish churches and royal chapels like the exquisite Sainte Chapelle at Paris. As the style developed it was applied to a great variety of buildings; it advanced in decorative richness, but slowly declined in power with the diminished demand for new cathedrals, of which only one, that at Albi, was erected in the 14th century. Chapels, parish churches like Saint Ouen and Saint Maclou at Rouen, were erected in the later

phase of the style, called from the flame-like curves of its tracery "Flamboyant," and earlier buildings were partly remodeled in the same period, like the choir of the Abbey of Mont Saint Michel, the façade of Rouen, and the transept fronts of Beauvais.

The perfected type of French Gothic cathedral, as exemplified at Amiens, for example, has a three-aisled nave, short transepts, a five-aisled choir with ambulatory and radiating apsidal chapels, and shows structurally a skeleton of supporting piers, arches and vaults with a series of deep buttresses capped by pinnacles and connected to the wall-buttresses of the clearstory by flying arches. The spaces between these members are filled by light walls and huge traceried windows. The church is some 400 feet long and from 100 to 140 feet high within to the top of the vault. The masonry, moldings, sculpture and carving are admirable in design and workmanship; the effect upon the spectator is one of extraordinary dignity, solemnity and power, eloquent of the religious fervor which created it.

**Spread of the style.**—The earliest spread of the style beyond France was across the Channel to England, of which French Normandy was in 1174 a province, and the first work to show the French Gothic influence was the choir of Canterbury cathedral, rebuilt after the fire of 1174 by a William from Sens, and completed after his death by an English William. In this work round arches and pointed arches, round piers and clustered piers, Norman and Gothic details are found associated together, but the predominant character is Gothic. Lincoln Cathedral was the first to be built throughout in the Gothic style, though parts of the Norman façade of an earlier edifice were retained. Wells, begun a little earlier but slower in building, and Lichfield a little later, Salisbury, built throughout between 1225 and 1258 (except the central tower and spire); Beverley, York, Southwell and Glasgow cathedrals and Westminster Abbey, all begun between 1225 and 1250, are among the most important examples in which the English Gothic style reigns throughout. But in addition one must note the great number of Anglo-Norman abbeys and cathedrals which were partly rebuilt in the more modern style like Hereford, Rochester, Gloucester and Ely cathedrals, having Norman naves (the first three with Gothic vaulting) and Gothic choirs; Peterboro, with a Gothic west front, Norman nave and choir and Gothic retro-choir, and many others. In the 14th century the Norman naves of Canterbury and Winchester were rebuilt in the advanced Gothic style then prevailing. This later phase is called the Perpendicular, from the character of its window-tracery. Like the Flamboyant in France it appears chiefly in partial remodelings of earlier buildings, in parish churches and in large chapels, of which three are especially notable: Saint George's chapel at Windsor, King's College chapel at Cambridge and Henry the Seventh's chapel at Westminster.

The English Gothic differs from the French in its greater massiveness and in exhibiting less of the French structural logic and structural loftiness. On the other hand, the decorative element is more conspicuous, especially in the interior treatment. The English multiplied their vaulting-ribs and developed superbly

decorative forms of vaulting, culminating in the fan-vaulting of the later churches. (See VAULTING). They also developed the Norman crossing-lantern into a splendid type of square central tower (Lincoln, Canterbury) sometimes with a spire (Salisbury). The deep French portals rich with sculpture are wanting; the doors are small, the west fronts picturesque rather than logically expressive. The French apse with radial chapels is found only in Westminster Abbey; most of the great churches have square East ends, after the Cistercian tradition. The English wooden ceiling on hammer-beam trusses, seen in many parish churches and in Westminster Hall, was an application of Gothic principles to a construction in timber. English tracery is remarkably beautiful and varied.

The style spread in the 13th century to Germany, but developed slowly, with less of consistency than in England. The plans are very varied; the apse surrounded by radial chapels is found in perfection only at Cologne (1248), and while there and at Regensburg and a few other places the French influence was strong, in other examples the details of the Gothic style were applied in a more or less capricious manner, as at Freiburg, Ulm, Oppenheim, Halberstadt, Marburg, etc. Strassburg and Metz are predominantly French. The Germans developed the traceried spire and the "hall-church," with aisles of equal height, as their most characteristic contributions to the style.

In Italy, Gothic principles of structural logic were never accepted; the Gothic details were applied as an ornamental dress to buildings of the most varied construction. A few "Gothic" churches were built by foreigners early in the 13th century (Assisi, Vercelli); others later in the century by Italians (Sta. Maria Novella at Florence, the Frari and Saint John and Saint Paul at Venice; Sienna Cathedral and the facade of Orvieto); but the majority of the Gothic work in Italy dates from the 14th century and early 15th. Santa Croce and the great cathedral at Florence were begun about 1296; the Certosa at Pavia, San Petronio at Bologna and Milan Cathedral, nearly a century later. In all these except Milan, flying buttresses are avoided; on the other hand, colored marble, inlays, mosaic and internal painting of the most splendid character were freely used. The secular Gothic style of Venice, seen in the Doge's palace and other palaces, was a remarkably original and effective local development.

Lack of space forbids here any account of the ecclesiastical Gothic architecture of Belgium and the Netherlands or of Spain, for which the inquirer is referred to the general histories of architecture and to works and articles on these countries.

**Secular Monuments.**—The style thus developed in ecclesiastical edifices was applied also in the design of such secular buildings as were needed, such as town halls, "palaces of justice," hospitals, guild halls and the like. The city republics of Italy were the first to create distinctive types of secular Gothic architecture, because of their strong civic independence. The Bargello and Palazzo Vecchio of Florence and the Palazzo Pubblico of Siena date from the latter part of the 13th century; the Doge's Palace at Venice from the 14th and

15th. In France, England, Germany and Belgium civic independence was slower in asserting itself architecturally; the French Gothic town halls (as at Compiègne) and palaces of justice (as at Rouen) belong mostly to the 15th and early 16th century; but there are city gates and civic towers of earlier date in many French towns. It was in the Netherlands, especially in what is now Belgium and French Flanders, that civic architecture was most brilliant, especially in the latter part of the 15th and early 16th century, as exemplified in the town halls of Arras, Audenarde, Bruges, Brussels, Ghent and Louvain, and in some of the guild houses of various cities.

Domestic architecture was at first of minor importance. The homes of the great feudal lords were fortified castles (see MILITARY ARCHITECTURE); those of the commoners mostly small and insignificant houses on crowded streets. The 14th century witnessed a great progressive change; palaces gradually replaced the castles, and in the cities especially they were often of great elegance (as in the house of Jacques Coeur at Bourges and the Hotel Cluny at Paris, both of the 15th century) in France, and in many examples in Italy, especially in Venice (Foscari Palace, Ca'd'Oro, etc.). In these later Gothic palaces the resources of the florid late Gothic style were freely employed, with many modifications (e.g., dormer windows in France, stepped gables in Germany and the Netherlands) to adapt them to their new functions. In England the finest secular works of the late Gothic period were the colleges and halls of the great universities, and the manor houses or country palaces of lords and gentry under the Tudor monarchs.

**The Modern Gothic.**—During the two middle quarters of the 19th century there was a widespread effort in Western Europe to revive the use of Gothic forms in modern architecture; a movement especially strong in England, which produced not only many interesting churches but also a large number of town halls, court-houses, etc., in free versions and adaptations of the historic Gothic style (Town Hall and Assize Courts at Manchester, the fine Houses of Parliament in London, the far less successful Law Courts in the same city, etc.). The movement spread, though feebly, to the United States, appearing chiefly in churches, of which a few—Trinity and Grace churches and the Roman Catholic cathedral at New York among others—are creditable and interesting works. With the eclecticism of the 20th century in America the details of the style have been applied to commercial buildings, as in the Woolworth building at New York, and the English collegiate Gothic very successfully employed in college and university buildings at New York, Princeton (N. J.), Chicago, Saint Louis, Bryn Mawr and other places. See ARCHITECTURE, MODERN.

**Bibliography.**—From the vast literature of Gothic architecture only a few titles can be given. For the general discussion: Cram, R. A., 'The Substance of Gothic' (Boston 1917); Gonse, L., 'L'Art gothique' (Paris, n. d.); Jackson, T. G., 'Gothic Architecture' (Cambridge 1915); Moore, C. H., 'Development and Character of Gothic Architecture' (New York 1899); Viollet-le-Duc, E., 'Dictionnaire raisonné,' etc. (Paris 1876). For French Gothic: Enlart, C., 'Manuel d'archéolo-

gie française' (Paris 1902), also Goussier, Moore and Viollet-le-Duc as above. For England: Bond, F., 'Cathedrals of England and Wales' (London 1912), and 'Introduction to English Church Architecture' (ib., 1913); Moore, C. H., 'Medieval Church Architecture of England' (New York 1912); Parker, 'Introduction to Gothic Architecture' (London 1866); Rickman, T., 'An Attempt to Discriminate the Styles, etc.' (London 1848); Scott, G., 'Medieval Architecture' (ib., 1886); Van Rensselaer, M. G., 'English Cathedrals' (New York 1893). For Germany: Foerster, 'Denkmale deutscher Baukunst' (Leipzig 1855-69); Hasak, 'Die romanische und die gotische Baukunst' (Stuttgart 1902); Lübke, W., 'Ecclesiastical Architecture in Germany,' etc. (London). *Professor of Architecture, Columbia University.*

**GOTHIC ART.** The art of the times and the countries in which Gothic architecture flourished. The term is a misnomer, because even if the architectural style were rightly designated "Gothic," the wall-paintings, metal work, etc., of the time are not properly so described. Still no other term exists for those arts which prevailed in Europe from 1150 to the beginning of the Risorgimento in Italy (about 1375), and in the North until the decided beginning of the Renaissance (about 1500). There are certain arts of decoration which flourished in a wonderful way during this period, while others attained little excellence. Thus the pottery of the north of Europe and even of Italy during the period named has never attracted much interest in modern times; very few examples of it remain, and what little there is that is effective in an artistic sense is decidedly Oriental (Saracen and Moslem) in character. Glass, too, is of little interest except in connection with windows, and apparently few glass vessels were made during the Middle Ages. On the other hand, metal-work was of singular interest. Bronze was not as common as it has always been in the East and as it was to be in Europe at a later period, but wrought iron reached a splendid development in the gratings, gates, window-bars, etc., of buildings, and in the singular enclosures made for tombs. Brass was cast in large sheets and hammered smooth and then engraved with arms and legends befitting the burial slab of a knight or noble lady; silversmiths' work was carried to a high pitch of excellence, and the common use of colored enamels applied to both bronze and to silver made the ecclesiastical implements and sacred vessels of the time extremely rich. Toward the close of the Middle Ages the complete plate armor of the nobles received a splendid decoration by means of reliefs and

embossings, and by gilding in patterns and etching with acid. Very beautiful stuffs were hardly ever woven in Europe during this period; for splendid weaves France, Germany and England sought the East; but the cloths and linens of the time were good and the common use of embroidery made the costume of the wealthy very splendid. The beauty of the costume, both in color and in form, affected the sculpture of the time; for, as the nude was hardly ever represented, the drapery of the figures became the chief object, with expression of face and gesture, of the architectural sculptors of the day. Both form and color were used freely in the beautiful ivory carvings which were richly painted and gilded.

Sculpture in connection with architecture is treated above. In the semi-architectural conditions of tombs and cenotaphs, life-size statues, usually recumbent, are found as early as the 13th century. These are of marble and other stone; and it is quite well ascertained that great numbers of statues in hammered bronze richly decorated with enamels existed at one time in the churches of western Europe; these also being of life-size for the most part. The raised chest or what seems the sarcophagus, the huge stone box which gives the name of altar-tomb to these monuments, often had its sides pierced with niches, and these occupied by statuettes of religious or symbolical meaning, often of great beauty. The carvings of decorative objects are of great variety, such as mirror backs and boxes to contain small mirrors, panels of book covers and statuettes of sacred subjects, sometimes 15 inches or more in height, in addition to elaborate bases upon which they stand.

Painting in the highest sense of the word, that is, the representation of human life and human sentiment, was used with reserve because it had to be applied either to the walls of the church and the palace, or to the vellum pages of a manuscript book. On this account we hardly think of the paintings of the Middle Ages as having led up to that of modern times: we think rather as the origin of modern work of the painting of the 14th century Italians, who themselves derived much of their art directly from Constantinople. Still there was a great skill showing itself in those two ways and the comparatively few remains which exist in France and Germany of the paintings on walls and vaults during the years before 1500 are worthy to be compared with the splendid miniatures in the manuscripts. These last are not always religious; some manuscripts were of history and poetry and the illustrations given to those books were in keeping with their subject. There had been a great destruction of these splendid manuscripts, but many remain in public and private collections, and modern books have been devoted to their study and to the reproduction of their finest paintings. The special achievement in the art of decoration was in the brilliant windows of the time, but for this subject see GLASS; also GOTHIC ARCHITECTURE and WINDOW.

RUSSELL STURGIS,

*Author of 'Dictionary of Architecture.'*

**GOTHIC LANGUAGE AND LITERATURE.** The language of the Goths is the oldest member of the Teutonic branch of the Indo-European family. It is known through a Visigothic Bible translation of the 4th century A.D. The earliest historical indications concerning the home of the Goths place them along the lower course of the Vistula in modern Poland and Prussia between Warsaw and Dantzic. Here they remained as late as 150 A.D., but early in the following century, having been dislodged probably by the movements of their Hunnish neighbors, they appeared to the north of the lower Danube and on the northwestern shore of the Black Sea in modern Rumania and southwestern Russia as far east as Odessa. To the west on the Danube were the Visigoths; to the east, in southwestern Russia, the Ostrogoths. In 251 they defeated the Emperor Decius at Philippopolis, but in 270, after various incursions into Thrace and Greece, were driven back to their seat north of the Danube. They were known to the ancient historians and geographers as Gotoines or Gothones, and later as Gothi, which points to the native name Gutos or Gutos.

The only extant monuments of the language are: (1) Portions of a Bible translation, of a paraphrasing interpretation of the Gospel of John, and of a calendar contained in fragments of manuscripts written in Italy in the 6th century, presumably by Ostrogoths and known as the *Codex Argenteus*. (2) The signatures of Gothic witnesses on two Latin records or receipts, one at Naples, one formerly at Arezzo; the originals of which are now lost. A few Gothic words and names of alphabetic symbols in a Salzburg MS. now at Vienna. (3) A few Gothic words in a Latin epigram, a large number of proper names from Greek and Latin sources, and in old Spanish documents and inscriptions. (4) The scanty records of a Gothic language, probably Ostrogothic, preserved as late as the 16th century in the Crimea. The Bible translation, of which there remain portions of Matthew, Mark, Luke, John, Romans, 1 and 2 Corinthians, Galatians, Ephesians, Philippians, Colossians, 1 and 2 Thessalonians, 1 and 2 Timothy, Titus, Philemon, Esdras, Nehemiah, is associated always with the name Ulfilar or Ulfilas. He was probably himself a Goth, born about 310 A.D., made bishop of the Goths 341, removed 348, with a large body of his followers avoiding persecution, into Mœsia, south of the Danube; died 380 or 381. Ulfilas not only did the work of translation, but he invented an alphabet for it, using as a basis the Greek uncial alphabet of his time with preservation of its order, as well as of the numerical and phonetic values of the letters. He adopted it, however, to its purpose by the use of forms taken from the Latin and Runic alphabets, creating a system better for the purpose than either of the three.

The inflexion of nouns is distinguished by its relatively close approach to the original Indo-European system. In its inflection and phonology it is the most primitive of the Germanic languages. Of the cases it preserves nominative, vocative, genitive, accusative and dative, the latter including the original instrumental and locative, and to some extent the ablative.

Consult Balg, 'Comparative Glossary of the

Gothic Language' (Maryville, Wis., 1887-89); Skeat, 'Mæso-Gothic Glossary' (London 1868); Wright, A. J., 'A Primer of the Gothic Language' (Oxford 1899).

**GOTHIC TAPESTRIES.** See TAPETRIES.

**GOTHs**, an ancient Teutonic tribe, whose earliest known home was the shores of the Baltic, between the Vistula and the Oder, where they were living in the 1st century after Christ. Thence they migrated in the 3d century to the regions adjoining the Black Sea. Many other tribes were incorporated with them, and by continual advances and conquests they established, under Ermenric (about 350), the great Gothic kingdom, extending from the Black Sea to the Gulf of Bothnia. This naturally brought the Goths into continual contact, on the west with the western Roman Empire, and on the east with the Eastern empire as centred at Constantinople. About the year 369 internal commotions produced the division of the great Gothic kingdom into the kingdom of the Ostrogoths (eastern Goths), on the shores of the Black Sea, from the Don to the Dnieper, and the kingdom of the Visigoths (western Goths), from the Dnieper to the Danube. About the year 375 vast multitudes of the Huns and of the Alans, which latter had been subdued by the Huns, poured out of Asia, and drove back the Ostrogoths upon the Visigoths. The Goths obtained permission from the Emperor Valens to settle in Thrace, but were driven to rebellion by the oppression of the imperial governor. In the war which ensued Valens himself was defeated and slain by them at Adrianople in 378. The Emperor Theodosius incorporated the Gothic army into his legions, and henceforth they had an important influence in the affairs of Constantinople. After many vicissitudes the Ostrogoths obtained a settlement in Pannonia and Slavonia, but not till the destruction of the kingdom of the Huns in 453. The Visigoths in process of time obtained a degree of power which excited alarm in Greece and Italy. In 369 Alaric made an irruption into Greece, laid waste the Peloponnesus, and became prefect of Illyria and king of the Visigoths. He invaded Italy about the beginning of the 5th century, and by that measure brought on the destruction of the Roman Empire, since Stilicho, the Roman general, could only obtain a victory over Alaric at Verona (i. e. 403) by withdrawing all the Roman troops from the borders of the Rhine. Alaric himself soon returned to Italy, and sacked Rome in 409, and a second time in 410. In 552 the Goths in Italy were finally overthrown in battle and expelled from the peninsula by Narses, general of Justinian. The Visigoths succeeded in establishing a new kingdom, called Gothia, in the southern parts of Gaul and Spain, of which, toward the end of the 5th century, Provence, Languedoc and Catalonia were the principal provinces, and Toulouse the seat of government. The last king, Roderick, died in 711 in battle against the Moors after which the Goths became merged in the Spanish kingdoms. Since the time of Constantine, Christianity appears to have taken root among the Goths, whence a Gothic bishop is mentioned as present at the Council of Niceæ, 325 A.D. Their form of Christianity was Arian, like that of their protector Valens,

and their bishop Ulfilas. The introduction of Christianity among these Goths, and the circumstance of their dwelling near and even among civilized subjects of the Roman Empire, greatly contributed to raising them in civilization above the other German tribes. Consult Bradley, 'The Story of the Goths' (New York 1888); 'Cambridge Mediæval History' (Vol. I, New York 1911). See GOTHIC LANGUAGE AND LITERATURE; OSTROGOTHIS; SEPTIMANIA; ULFILAS; VISIGOTHS.

**GOTTENBURG**, göt'ten-boorg, **GOTHENBURG**, or **GOTEBORG** (Swedish *Göteborg*, or *Götheborg*; Latin, *Gothoburgum*), Sweden, seaport, the second in the kingdom in respect to population and trade, 25 per cent of the foreign trade of the country being done here, capital of the county of the same name; situated on the Gota, five miles from its mouth, 255 miles west-southwest of Stockholm. It has a dry dock cut out of the solid rock and five miles of quays; and the completion of the Gota Canal and also the railway facilities have greatly increased its commercial importance. Although founded in 1618, by Gustavus Adolphus, the town, in consequence of numerous fires, is quite modern—the streets are at right angles and the houses well built. It has a university attended by 2,000 students, and a library of 130,000 volumes. The manufactures include iron, steel, machinery, sail-cloth, linen and leather, and there are oil-presses, cotton-mills, dye-works and building-yards, at which a considerable number of vessels are launched; the most important industrial establishments are tobacco factories, porter breweries and sugar-refineries. The trade is very extensive, the harbor being excellent and generally free from ice. Its commercial importance dates from the Continental blockade of 1806, when it became the chief British depot in northern Europe. The chief exports are iron ores, wood, pulp, grain, dairy produce, cattle, matches and soap; the chief imports coal, iron, bacon, silk, linen, cotton goods, petroleum, machinery and implements and salt. Among social reforms the town is noted for its licensing system (see **GOTHENBURG SYSTEM**). It is the seat of a United States consulate. Pop. 178,875.

**GÖTTERDÄMMERUNG**, göt'ter-dem'me-roong, 'the twilight, or gathering nightfall of the gods,' the title of Wagner's closing opera in his Nibelungen cycle of dramas, first produced at the Bayreuth Festival 11 Aug. 1876, and in the United States at New York, 25 Jan. 1888. The subject of the opera is what is called in Scandinavian mythology the *Ragnarok*, or end of the world. This was brought about largely by the admission of Loke, the god of evil and mischief, into Asgard, the abode of the gods. It was through Loke that Balder, the bright and good god, was slain and flung down into the abodes of Hel, the goddess of death. Confusion throughout the universe is the consequence. The sun and moon are swallowed by giants; continuous winters rage without an intervening summer; the earth trembles in the throes of earthquakes. Mountains topple down with a crash; the Fenriswolf breaks its chains and fetters. The Midgard serpent writhes to get free; the ship Naglfar, built of the finger-nails of dead men, passes over the sea, filled with

giants of the frost and mountain; Loke leads the hosts of Hel and bursts upon the scene. The powers of evil rush to the battlefield Vigrid, while Heimdal blows his Gjallarhorn, Odin seeks the giants for advice, the other gods as well as the heroes of Valhal arm themselves and sally forth, and the battle begins. While the fight is still raging the immortal god Surt flings light and flame over the world, and the earth, reduced to ashes, sinks beneath the watery waste. See **NIBELUNGENLIED**; **RAGNAROK** and **SCANDINAVIAN MYTHOLOGY**.

**GOTTFRIED** (gö'tfrēd) OF **STRASSBURG**, German poet; probably b. Strassburg, about 1200. He was not, like most of the Minnesingers (minstrels) of his age, a noble. Besides many lays, he was the author of the great chivalric poem, 'Tristan und Isolde,' derived from a Celtic original, but possessing as much originality of character as any other German classical work. For grace, elegance and vivacity of description, richness of coloring and melody of versification, this work stands alone in old German literature. It has had a great influence on later literature and furnished the theme for one of Wagner's greatest operas. There are two good editions of this work; that of Bechstein (2 vols., Stuttgart 1881) and Golther's edition in 'Deutsche National-Litteratur,' Vol. IV (Berlin 1888). The translation into modern German by W. Hertz (2d ed., Berlin 1894) is considered the superior of all others. For Gottfried's life consult Bergemann, 'Das höfische Leben nach Gottfried von Strassburg' (Halle 1876); Heidingsfeld, M., 'Gottfried von Strassburg als Schüler Hartmanns von Aue' (Rostock 1886); Schmidt, C., 'Ist Gottfried von Strassburg Strassburger Stadtschreiber gewesen' (Strassburg 1876); Stiebeling, Karl, 'Stitistische Untersuchungen über Gottfried von Strassburg' (Leipzig 1905).

**GOTTHEIL**, gö'thil, **Gustav**, American rabbi; b. Pinne, Posen, 28 May 1827; d. New York, 15 April 1903. He was educated at the universities of Berlin and Bonn. In 1855 he was elected assistant rabbi at the Berlin Reform Temple, and in 1861 received a call to the congregation of British Jews, Manchester, England, where he spent 13 years of effective work. In 1873 he was invited to the temple Emanu El, of New York, first as assistant to Rev. Dr. Samuel Adler, and then, on the latter's retirement, as sole rabbi. In his new field his activity rapidly developed; under his personal impetus the Emanu El Preparatory School and the Jewish Ministers' Association were founded, and continued for some years. He organized the Emanu El Sisterhood of Personal Service, which, adopted by many other congregations, has become a successful feature of communal benevolence. A favorite speaker at public gatherings, his enthusiasm, sympathy and broad culture did much to win recognition for his coreligionists. In his last years he was an ardent champion of Dr. Herzl's movement to secure a place of shelter for persecuted Jews, the latest development of the Zionist idea. Besides contributions to magazines and reviews, his published works include a hymnbook and 'Sun and Shield,' a book of daily devotion, in both of which he drew largely from non-Jewish sources.

**GOTTHEIL, Richard James Horatio**, American Semitic scholar: b. Manchester, England, 13 Oct. 1862. He was graduated from Columbia in 1881, studied also at Berlin, Tübingen and Leipzig, and became professor of Semitic languages in Columbia, director of the Oriental section of the New York Public Library in 1896 and (1898) president of the American Federation of Zionists, of whose principles he is an active exponent. He is also a member of the central committee of the general organization. He became an editor of the 'Jewish Encyclopedia' in 1901, and published 'The Syriac Grammar of Mar Elia of Zohba' (1887); 'Selections from the Syriac Julian Romance' (1906); 'Zionism' (1914). He wrote many articles on Oriental and Jewish questions for newspapers and reviews, edited the 'Columbia University Oriental Series,' and the 'Semitic Study Series.' He is a vice-president of the American Oriental Society, and treasurer of the American committee for Lectures on the History of Religions and chairman of its committee on publications. He is a son of G. Gottheil (q.v.).

**GOTTHELF, gô't'helf, Jeremias.** See BITZIUS, ALBERT.

**GÖTTINGEN, gêt'ting-ën, Germany**, town in the Prussian province of Hanover, in the valley of the Leine, 59 miles south-southeast of Hanover. It is a place of great antiquity, and was once famous for its fortifications. It contains a gymnasium, trade school, training school for teachers, a museum of antiquities and the Anatomic Museum, with its famous collection of schools. It contains a noted university, founded in 1734. Göttingen belonged to the Hanseatic League and enjoyed great prosperity until the Thirty Years' War. The manufactures consist chiefly of woollen tissues, tobacco, leather, sugar, chemicals, bologna sausages, paper, books and scientific and musical instruments. Pop. 37,594.

**GÖTTINGEN, University of, or GEORG-AUGUST UNIVERSITY**, German institution, was founded by George II of England, known also as Georg August, Elector of Hanover. The plan of the school was outlined as early as 1732, was established in 1734 and opened in 1737. Its organization was perfected by Von Münchhausen, who for many years directed its destinies. Its popularity decreased after the expulsion of the seven professors: Albrecht, Dahlmann, Ewald, Gervinus, the two Grimms and Weber, for political reasons, but it has recovered itself since 1866, and has increased with remarkable rapidity since the beginning of the 20th century, having about 3,000 students in 1914, and several eminent names among its professors. The principal building, to which William IV of England contributed £3,000, was completed in 1837. There is a large number of laboratories, clinics, etc., connected with the university and also a museum with extensive and valuable collections, an observatory, a well-equipped school of anatomy, botanical gardens and a library of about 600,000 printed volumes and nearly 6,000 manuscripts. It has also a pedagogical seminary, a gymnasium which dates from the 16th century, a museum, an art gallery of German and Flemish pictures. Consult Pütter, Saalfeld and Oesterley, 'Die Georg-August Universität'

(Göttingen 1838), and *Chronik der Georg-August-Universität* (annually).

**GOTTSCALK, gôt'shalk, Louis Moreau**, American pianist and composer: b. New Orleans, La., 8 May 1829; d. Rio de Janeiro, Brazil, 18 Dec. 1869. He studied in Paris and after his return to the United States in 1853 became the most popular pianist in America. His playing was confined to his own compositions. He traveled extensively in Mexico, the West Indies and South America, and was taken fatally ill, while playing at Rio Janeiro his latest work, 'La Morte.'

**GÖTZ VON BERLICHINGEN.** See BERLICHINGEN, GÖTZ VON.

**GOUCHER COLLEGE**, Baltimore, an institution of higher learning for women. It was first known as the Woman's College of Baltimore, and was founded under that name in 1844 by the Methodist Episcopal Church. In 1910 it took its present name in honor of the Rev. John and Mrs. Mary Goucher, whose gifts contributed largely to the foundation of the institution. Dr. Goucher was also president of the college from 1890-1908. The principal buildings are Goucher Hall, Bennett Hall and Catherine Hooper Hall. There are also dormitories and fine libraries and laboratories. The degree of B.A. is the only one given. A college course for teachers and graduate courses are conducted in co-operation with Johns Hopkins University. The teaching staff numbers 55 and the students 712. There are about 27,000 volumes in the library. The president is Dr. William Westley Guth.

**GOUGE**, the ground up clay-like material produced by the rubbing of one wall of a fault (q.v.) against the other. Selva is another term for the same thing, and breccia (q.v.) is used to denote coarser material of the same origin.

**GOUGH, gôf, John Bartholomew**, American temperance lecturer: b. Sandgate, Kent, England, 22 Aug. 1817; d. Frankford, Pa., 18 Feb. 1886. He came to America in 1829 and two years later became a bookbinder in New York. Falling into dissipation, he lost regular employment and was reduced to giving recitations and singing comic songs at low grog shops. In 1842 he was induced to attend a temperance meeting and take the pledge; and he then made up his mind not only to reform, but to influence others to do likewise. Save for a short relapse, a few months later, his pledge was kept, and ere long, as a temperance lecturer, he became one of the most popular of public speakers in America and England, which he visited on temperance tours 1853-55, 1857-60 and 1878. In later life he handled literary and social topics as well as temperance themes in his lectures. He published an 'Autobiography' (1846; enlarged 1870); 'Orations' (1854); 'Temperance Lectures' (1879); 'Sunlight and Shadow, or Gleanings from My Life Work' (1880).

**GOUIN, goo'ân, Sir Jean Lomer**, Canadian statesman: b. Grondines, Quebec, 19 March 1862. He is a graduate of Laval University, was called to the bar in 1884, and engaged in the practise of his profession in Montreal. He was first returned to the provincial legislature in 1897, was appointed minister of works in

1900 and has been premier of the province since 1905. His administration has since that time been sustained at three successive general elections. He is an officer of the Legion of Honor and was created K.C.M.G. in 1913.

**GOUJON**, goo-zhôn', **Jean**, French sculptor and architect: b. Paris, 1515; d. about 1570. He was employed with Pierre Lescot, architect of the Louvre, on the restorations of Saint Germain l'Auxerrois, 1542-44; and after the accession of Henry II, decorated the Chateau d'Anet for the king and Diana of Poitiers. To him is ascribed what is considered the masterpiece of French sculpture, the 'Huntress Diana,' now in the Louvre collection, and the fountain of the Innocents at Paris was also his work.

**GOULD**, goold, **Augustus Addison**, American zoologist: b. New Ipswich, N. H., 23 April 1805; d. Boston, 15 Dec. 1866. He was graduated at Harvard 1825, and in 1856 became visiting physician to the Massachusetts General Hospital. His strong scientific tastes led him to take up investigations in botany, zoology and conchology, and in the latter branch he became one of the most eminent authorities in the whole world. He published 'System of Natural History' (1833); 'Invertebrate Animals of Massachusetts' (1841); 'Otia Conchologica' (1863); 'Principles of Zoology' (with Agassiz, 1848).

**GOULD**, Benjamin **Apthorp**, American astronomer: b. Boston, Mass., 27 Sept. 1824; d. Cambridge, Mass., 26 Nov. 1896. He was graduated at Harvard in 1844 and pursued the scientific study of astronomy at several foreign observatories, returning to America in 1848. In 1851 he assumed charge of the longitude department of the United States Coast Survey, and perfected methods for determining the longitude telegraphically. By 1866, 20 longitudes in the United States had thus been determined. He was director of the national observatory at Cordova, Argentina, 1870-85, and there completed three extensive star catalogues, and conducted meteorological and climatological investigations. He was the founder and editor of the *Astronomical Journal* (1849-61) and published 'On the Trans-Atlantic Longitude, as Determined by the Coast Survey' (1869); 'Uranometria Argentina' (1879), etc.

**GOULD**, Elgin **Ralston Lovell**, American economist: b. Oshawa, Ontario, Canada, 15 Aug. 1860. He was graduated from Victoria University, was Fellow (1882-84) and lecturer (1892-97) at the Johns Hopkins University, and professor in the University of Chicago (1895-96). In 1896 he became president of the City and Suburban Homes Company of New York, and at one time vice-president of the American Economic Association. In 1901-02 he was lecturer on political economy at Columbia and was city chamberlain of New York 1902-04. He is active in financial, philanthropic and church affairs and reform movements in New York. He has written 'The Housing of Working People'; 'Popular Control of the Liquor Traffic'; 'The Gothenburg System of Liquor Traffic'; 'The Social Condition of Labor.'

**GOULD**, George **Jay**, American capitalist: b. New York, 6 Feb. 1864. He was the eldest son of Jay Gould (q.v.) and was educated privately. In financial circles he was active

chiefly in connection with his large railway interests, particularly as president, from 1888, of the Little Rock and Fort Smith Railroad, from 1892 to 1913 of the Manhattan Elevated Railroad of New York, and from 1893 of the Saint Louis, Iron Mountain and Southern, the International and Great Northern and the Missouri Pacific. He is a director of many other railroads and is connected with several industrial enterprises.

**GOULD**, Hannah **Flagg**, American poet: b. Lancaster, Mass., 1789; d. Newburyport, Mass., 5 Sept. 1865. She was an aunt of B. A. Gould (q.v.), wrote much for magazines and newspapers and at one time very popular as a verse writer. Her verse is simple and pleasant and of a high moral tone. She published 'Gathered Leaves' (1846); 'The Diosma' (1851); 'Hymns and Poems for Children' (1854); 'The Golden Vase'; 'The Youth's Coronet' (1850); 'The Mother's Dream' (1853), etc. 'The Snow-Flake' and 'The Frost' are still remembered and quoted among her poems.

**GOULD**, Helen **Miller**. See **SHEPARD**, **HELEN MILLER (GOULD)**.

**GOULD**, Jay, American financier: b. Roxbury, N. Y., 27 May 1836; d. New York, 2 Dec. 1892. He was brought up to labor on his father's farm; and was for a short time a student at Hobart College. Here he learned surveying. After making surveys of Ulster, Albany and Delaware counties, he published a 'History of Delaware County' in 1856, and in this same year engaged in the lumber and tanning business in western New York, disposing of his interests prior to the panic of 1857. After engaging in banking for a few months he became interested in railroads. This was directly after the panic of 1857. His first speculation was the purchase of the bonds of the Rutland and Washington Railroad from Troy, N. Y., to Rutland, Vt. He himself became president, treasurer and superintendent of the road. Soon afterward he effected a consolidation of his road with the Rensselaer and Saratoga line, withdrew his capital, removed to New York, opened a broker's office and began dealing in Erie stocks and bonds. His aim was to gain control of the Erie. This he did by depressing the value of the stock and then buying it in. In association with James Fisk, Jr., he entered the directory of the company, was elected president, while Fisk became vice-president and treasurer. On the reorganization of the company, 1872, he lost official connection with it. His manipulation of Erie stock was the first of many similar speculations by which he obtained control of several great railroad systems. His method was to depress the value of the stock of the road he sought to control and to buy it in while at a low ebb. He then invested in the Pacific railroads, secured control of several lines, built branches and effected combinations which resulted in the establishment of what is known as the 'Gould system.' Jay Gould and his partner, Fisk, in 1869 entered into a scheme to corner the gold market of New York and this resulted in the financial crisis and panic known as 'Black Friday' (q.v.). The attempt netted them about \$11,000,000. He controlled about 10,000 miles

of railroad in 1880, and by merging several competing telegraph lines formed the Western Union system in 1881. In this year he also gained control of the New York Elevated Railroad.

**GOULD, John**, English naturalist: b. Lyme, Dorsetshire, 14 Sept. 1804; d. London, 3 Feb. 1881. His reputation as a taxidermist procured him the post of curator to the Museum of the Royal Zoological Society in 1827, and in 1832 he published 'A Century of Birds from the Himalayan Mountains.' He next undertook a work of much more extensive character, entitled the 'Birds of Europe,' published 1832-37. This was followed by 'Birds of Australia' 1842-48; 'Mammals of Australia' (1859); 'Monograph of the Trochilidae, or Family of Humming Birds' (1850); 'Monograph of the Odontophorinae, or Partridges of America,' etc.

**GOULD, Sabine Baring.** See **BARING GOULD, SABINE**.

**GOULD, Thomas R.**, American sculptor: b. Boston, 1818; d. 1881. He was a pupil of Seth Cheney, of Boston, and there established his first studio. From 1868 he was in Florence, Italy. His works include a statue of Hancock in the Lexington town-hall; portrait-busts of Junius Brutus Booth, Emerson and Gov. John A. Andrew; and the ideal statues 'The West Wind,' in the Mercantile Library, Saint Louis, 'Christ' and 'Satan.' Other important works are a statue in bronze of King Kamehameha I, Honolulu, and 'A Puritan' on the Common at Cambridge, Mass. Consult Tuckerman, 'Book of the Artists' (New York 1867).

**GOUNOD, goo'nô**, Charles François, French composer: b. Paris, 17 June 1818; d. Saint Cloud, 18 Oct. 1893. He began his studies in the Paris Conservatory under Halévy, Le Sueur and Paër, and carried the Rome prize with his cantata 'Fernando' in 1849. While in Rome he made Italian Church music his chief study. His mass in the style of Palestrina, which he composed in Vienna in 1843 after his return from Rome, was the first fruits of this study. On arriving at Paris he took charge of the music in the church of the Missions Etrangères, and produced no original work until April 1851, when his first opera, 'Sappho,' appeared. Gounod's next production was the five-act opera, 'The Bleeding Nun' ('La Nonne sanglante') (1854). Following this was the comic opera founded on Molière's 'Le Médecin malgré lui' (1858), and the grand opera 'Faust et Marguerite,' which latter was a signal success and was produced with much enthusiasm in all the more important opera houses of Europe. Even in Germany, the home of the Faust legend in music and poetry, the originality and wealth of melody of Gounod's music, together with his powerful orchestration, were so manifest above all else in the opera, that his Faust became a favorite with the public. Later operas of his were 'Philemon et Baucis' (1860), which was not popular; 'La Reine de Saba' (1862); 'Mireille' (1864); 'Roméo et Juliette' (1867), which was favorably received in every opera house of Germany; 'Polyeucte' (after Corneille's drama), which was a failure; finally the comic opera, 'Cinq Mars' (1877), and the last of his grand operas, 'Le Tribut de Zamora,' which was well received. Besides these oper-

atic compositions he wrote much religious music, notably the 'Rédemption,' which was performed in England and later in Germany, and has been very popular in the United States. He also produced at Brussels his 'Mors et Vita,' and in addition wrote cantatas, symphonies, pieces for the piano and numerous songs. During the Franco-Prussian War (1870-71) he resided in England where he formed the Gounod Choir, a chorus of mixed voices, whose concerts were widely popular. Consult Bellaigue, C., 'Gounod' (Paris 1910); Claretie, 'Portraits Contemporains' (1875); Voss, 'Ein Lebensbild' (1895); Hillemacher, P. L., 'Gounod' (Paris 1905); Imbert, H., 'Charles Gounod' (Paris 1907); Prudhomme, J. G., 'Gounod: Sa vie et ses œuvres' (2 vols., Paris 1911); Tolhurst, H., 'Gounod' (New York 1904); Paggerre, 'Charles Gounod, sa vie et ses œuvres' (1890); Boret, 'Charles Gounod, His Life and His Works' (1890).

**GOUPIL, goo-pêl**, Jules Adolphe, French painter: b. Paris, May 1839; d. Neuilly, 30 April 1883. He was a pupil in the studio of Ary Scheffer and achieved success by his powers as a portrait and genre painter. His most famous picture, 'Mme. Roland's Last Day in Prison,' is in the Luxembourg. His father, Adolph Goupil, did much to encourage the introduction of French art into this country; well known throughout Europe as a Parisian picture dealer, he opened a branch house in New York.

**GOURA, gow'ra**, any one of a group of large, handsomely dressed pigeons of New Guinea, constituting the genus *Goura* and distinguished by their fan-like crests—the crowned pigeons. These birds are found near open or cultivated lands, ranging near the ground in small flocks and feeding on buds, seeds, berries and other fruits, and on worms, snails and insects. In addition to the cooing heard in the nuptial season, they utter harsh, trumpet-like cries. During the heat of the day, or when alarmed, they hide in the thickest jungle. They make rude nests and lay only one white egg. The best-known species (*G. coronata*) is a beautiful bird as large as a small turkey. It is sometimes kept among poultry, and its flesh is much esteemed. The lovely crests of these pigeons form the millinery ornament "goura," and the birds were threatened with extinction on account of the demand for these feathers until lately put under adequate protection.

**GOURAMI, goo'ra-mi.** See **GORAMY**.

**GOULD, gôrd** or **goord**, a plant of the genus *Cucurbita* or *Lagenaria*, or its fruit. In Europe the name is given generally to pumpkins, squashes, melons, etc., but in America it is restricted to those with hard-skinned, thin-fleshed, inedible fruits, cultivated for ornament or because their excavated shells are useful as dippers, etc. See **CALABASH GOURD**; **CUCURBITACEÆ**.

The Hebrew word translated gourd in Scripture is apparently so much akin to the Greek word *kiki*, used by Dioscorides for the castor-oil plant (*Ricinus communis*), that the "gourd" of Scripture was probably that species. It is a euphorbiaceous plant. The wild gourd of Scripture was a wild vine—that is, was procumbent

and had tendrils. It moreover produced "death in the pot," discoverable in a moment by the taste. It was probably either the colocynth (*Citrullus colocynthis*) or the squirting cucumber (*Momordica elaterium*).

**GOURD-SEED.** A fish. See BLACKHORSE.

**GOURD-WORM,** the fluke-worm (q.v.) which affects the livers of sheep.

**GOURGAND,** goor'gân', Gaspard, BARON DE, French general: b. Versailles, 14 Sept. 1783; d. 25 July 1852. Entering the army as lieutenant of artillery in 1802, he distinguished himself in several important battles, and in the battle of Brienne saved Napoleon's life from the Cosacks. He subsequently became Napoleon's adjutant, and as his confidential secretary accompanied him to Saint Helena, but for various political reasons left him in 1818. He was subsequently aide-de-camp to Louis Philippe and became a member of the House of Peers in 1841. In the previous year he was made one of the commission appointed to bring the remains of Napoleon from Saint Helena to France. He was passionately devoted to Napoleon and unreasonably jealous of those who attended upon the emperor in his exile. He assisted Napoleon in writing his 'Mémoires' and was the author of 'La campagne de 1815'; 'Mémoires pour servir à l'histoire de France sous Napoleon' (1822-23); 'Réputation de la vie de Napoleon par Sir Walter Scott' (1827); and a remarkable journal kept during his stay at Saint Helena, but which remained in MSS. till 1898. An English translation of selections from the journal by Mrs. Elizabeth Latimer (q.v.) appeared in 1903. The work is exceedingly prolix, but of great value, since it records with the minuteness of Pepys, or the precision of Boswell, the incidents of daily life and the conversations of the fallen emperor. In no other work can the personal side of Napoleon be so well studied as in Gourgand's journal. An entire chapter is given to the emperor's criticisms on his own action at Waterloo, and of equal interest are his judgments concerning other great commanders from Caesar's times to his own. His opinions regarding English character are essentially French in their character and amusing from their entire misconception of it. But in this journal we are shown Napoleon's conversation on almost every conceivable subject, insignificant or important, and always with the frankest egotism.

**GOURGUES,** goorg, Dominique de, French soldier and adventurer: b. Mont-de-Marsan, 1530; d. 1593. Captured by the Spaniards in Italy, where he was serving in the army of Maréchal de Strozzi (1557), he was condemned to the galleys and in 1559 his ship was taken by the Turks; the Turkish ship in turn fell into the hands of the Knights of Malta, who set him at liberty. After many voyages to Africa and South America he signalized his name by taking vengeance on the Spaniards of Fort San Mateo, who under Menendez had massacred the Huguenots of Fort Caroline, Florida. He razed Fort Mateo and killed in battle or hanged every Spaniard he found there. Consult Parkman, 'Pioneers of France in the New World' (Boston 1903).

**GOURLAY,** Robert Fleming, Upper Canada reformer: b. Ceres, Fifeshire, Scotland,

1778; d. Edinburgh, 1863. Before settling in Canada at Kingston in 1817 he had agitated for a reform of the poor laws in Great Britain. His attacks on the land system of Upper Canada brought him into conflict with the government; in 1818 he was twice indicted before a jury and acquitted, and recourse was then had to provisions of an Alien Act of 1804, under which foreigners were compelled to leave the country unless they could prove their innocence. On his refusal to leave the country he was arrested at Niagara, and after being imprisoned for seven months was brought to trial and sentenced to banishment in August 1819. He returned to the province in 1856 and resided there for a few years.

**GOURNAY,** Jean Oaude Marie Vincent, SEIGNEUR DE, French economist: b. Saint Malo, March 1712; d. 27 June 1759. He received his first ideas on economics from his father, a merchant of Saint Malo. Naturally these ideas were based upon commerce and exchange rather than on agriculture. These early opinions were reinforced and developed by Gournay's long residence in Cadiz (1730-44), and by his journeys to Hamburg, Holland and England. He soon acquired a fortune quite sufficient for his moderate tastes. He settled down in Paris. The friendship of Machault and Trudaine readily procured him a position as counsellor to the Great Council, and later as superintendent of commerce. He wrote 'Observations a la suite des mémoires de Forbannais, la prohibition des toiles peintes' (1755), a translation of several British works on economics. He exerted a strong influence on a coterie of his younger contemporaries, among whom was Turgot. It was in fact through personal contact with these men that he played the greatest part in economics, rather than through his writings. He was a Physiocrat, and the doctrine of 'Laissez faire, Laissez passer' is largely due to him, but he was not an extreme believer in free trade.

**GOUT,** a disease of comparative infrequency, affecting for the most part the large joints of the foot or knee, and accompanied by a deposition in the joints of a salt or uric acid, notably sodium urate. It is a disease that has been observed for many centuries and many of the older classical writers have left descriptions, jibes and witticisms concerning it. Notwithstanding an immense amount of study of the many factors concerned with gout it remains true that the real essential causes of the disease are still under investigation. Gout is found throughout civilized communities, but it is no respecter of persons, alike affecting the rich and the poor, although it is more prevalent among the former. Whether the afflicted are the "fag-ends" of previously well-to-do families is unknown. Gout is thought to be much more common in England and in Germany than it is in the United States, and the few statistics available, while notoriously unreliable, seem to bear out this belief. Some observers believe that the disease is becoming more frequent in the United States. On this point, however, there are almost no reliable figures. It is a disease of middle years, and men are more often attacked than women.

The symptoms of gout may be grouped under three general heads, acute gout, chronic gout

and irregular gout. In acute gout there may be premonitory twinges of pain in the small joints of the hand or foot. These may be accompanied by dyspepsia, restlessness, and irritability. The urine is usually diminished in amount, is dark in color and strong in odor. On cooling, a greater deposit of brick-dust urates occurs than is usual. This brick-dust sediment, it should be borne in mind, occurs in practically all healthy urine when cooled. It is not a sign of disease, and quacks would starve if the people did not believe their "brick-dust" horrors. The gout attack frequently commences in the middle of the night, not uncommonly seems to follow an exciting nightmare, often following attacks of excessive anger. There is excruciating pain in some one of the joints of the body, usually of the big toe. The pain is accompanied by swelling, redness and stiffness of the joint, and there may be some constitutional disturbance with a rise of temperature to 102° and 103° F. The symptoms may slowly subside during the day, to recur with equal or diminished severity at a 24-hour interval. After 3, 4 or 6 days the swelling and pain gradually grow less, and in 8 or 10 days the patient may be well. Other joints may be involved, and the attack may last only a few days or may persist for two weeks or more. Occasionally there are accompanying gastro-intestinal disturbances, with nausea, vomiting, diarrhoea, dyspnoea and heart-depression. If an acute attack is followed by other attacks, a condition of chronic gout develops. The joints become sore and remain swollen, and a large number of joints become involved in the reaction. The joints no longer lose their swollen appearance, since deposits of urates take place in the cartilages and in the ligaments, but become further enlarged and distorted. These local collections of urates are termed tophi, and they may be found in other joints—in the hands, knees, elbows and even in the ear-cartilages. The frequent attacks of pain leave the patient much more irritable. He is apt to be dyspeptic, sallow-faced, and to show signs of disease in his heart and blood vessels. Under the term irregular gout have been grouped a veritable scrap-basket assortment of symptoms which different clinicians have thought were undeveloped cases of gout. By many authorities these irregular forms of so-called "gouty diathesis" are taken "with a grain of salt"; yet there is little doubt that a number of more or less definite symptoms are found in those who are moderately gouty which may be attributed to this disease. These irregular forms are frequent in gouty families and include certain forms of chronic eczema, attacks of biliousness with marked constipation, etc. Frequently there is a condition of arteriosclerosis (q.v.) with tendency to the development of slight dropsy or other symptoms of disease of the heart or kidneys. Nervous headaches or migraine may be another heritage, although migraine is such a common disturbance that its presence proves little for any of the many one-sided theories concerning it. Itching feet, hands or eyeballs, irritable bladder with small quantities of acid, high-colored urine, are other symptoms attributed to irregular gout. Occasionally severe forms of eye-disease occur in those thought to be gouty, to account for which no other cause seems probable.

The cause of gout is extremely complicated. The theories are as numerous as the sands of the sea. A bad heredity is one of the most important factors, since from 50 to 60 per cent of gouty patients have had it left to them by their ancestors, one or two generations back. The boys seem more prone to this influence than the girls. Advancing age plays some part, the disease usually setting in before 50 years and generally after 40, although in the markedly hereditary forms the disease may come on much earlier, especially in the irregular manifestations. Alcohol is perhaps the most important contributory factor, those indulging in large quantities of fermented liquors seeming to be much more liable to contract the disease. Among the poor it is chiefly in the ale and beer drinkers that the disease is found. Overeating, lack of exercise and minor injuries to the feet are also important causes of the development of gout. As for the general theories to account for the poisoning—for it seems like a poisoning—all at best are pure hypotheses. Uric acid is considered by many as the chief criminal, but beyond the fact that there is an increased amount of uric acid found in the urine during an attack, and deposits of a salt of uric acid in the joints, there is no proof of its causative influence. Many modern students believe this to be a purely secondary condition, and not a primary one. There is a marked increase in the metabolism of nucleoproteids which in large measure accounts for the increase in one of its products of oxidation, uric acid. Clifford Allbutt has well summed it up when he writes that we are far from sure that gout may not be due to some extrinsic element. The peculiar geography of gout is in need of careful inquiry; the effects of microbic infection of the kidney are unknown in their relation to the precipitation of uric acid. Again, some internal secretion may be at fault, as in diabetes. "Till we know then whether gout is a mere shortcoming in ordinary metabolism, or a peculiar perversion of it, or a static susceptibility of fibrous tissue, or a defect of some enzyme, or a perturbation of the nervous system, or again some factor from without, it appears we must confine the name of gout to the uratic precipitations which are known, and which can serve as a touchstone, and as to all other vague 'acidities,' 'flatulencies,' 'migrains,' and 'biliousness' of whatever occult kind, be content to treat them empirically, awaiting the results of the analysis of our nutritive life upon which biochemistry is actively and hopefully engaged." Summing up what is really known about the pathology of the disease, it seems established (1) that gout is a morbid condition, of which the most striking phenomena are acute attacks of arthritis (q.v.), which tend to recur and are accompanied by redness, pain and edema of the part; (2) that the affected joints are found to be the seat of a deposit of urate of sodium, which occurs first in the articular cartilages and afterward infiltrates all the surrounding structures; (3) that deposits of this material may also be found in other parts, such as the pinna of the ear, the bursae, etc.; (4) that excess of uratic material may be demonstrated in the blood of a gouty patient, the amount being greatest before an acute attack, and least immediately after one; (5) that the

influence of heredity in producing gout is undoubted; and that certain poisons, such as lead and malt liquors, may induce an attack. In the same manner our ignorance concerning the cause of gout may be summed up by saying (1) that it is not known how the excess of uratic matter is brought about, whether it is due to an increased intake with the food, to increased formation in the body or to deficient elimination by the excretory organs; (2) that it is not known whether the uratic excess is the cause of the phenomena of the disease or is a mere casual accompaniment of the perverted state of nutrition; (3) that it is not known in the case of arthritic attacks whether the deposit of urate of soda is the cause or the effect of the local inflammation; in other words, that gout is a disease the cause of which is not yet fully understood. No study of mental background which is present in gouty individuals has yet been made, but there are enough facts to warrant the surmise that the defect in metabolism which results in a gouty attack may be induced by faulty unconscious mental activities. Chronic unconscious grouches or ingrown bad temper is a most frequent accompaniment of gout and may be a producing cause.

The treatment, however, is on better foundations. Here empiricism has taught the general rule that most people eat and drink too much and that temperance in all things is beneficial in gout as in other experiences in life.

**Treatment.**—No routine line can be laid down that can be adapted suitably to all cases. Individualism—the treatment of the patient, rather than the disease—is the prime feature. The treatment for gout should include (1) the medicinal treatment of the gouty paroxysm, in acute gout; (2) the medicinal and dietetic treatment of the subacute and chronic conditions, and (3) the treatment of the affected joints, with the object of removing, if possible, the foreign deposits.

The horizontal or slightly elevated position for the limb, with a cradle to take off the weight of the bed-clothes, warm packs, soothing lotions such as the lead and opium wash, and an oil-silk covering constitute the main features in the local treatment of an acute attack. Internally, colchicum, in dosage to be determined by the physician, is the best remedy. A brisk cathartic aids the action of the colchicum, and a mild diuretic may be combined to advantage—citrate of potash, cider, lemonade, being reliable. The pain and insomnia should be controlled by the visiting practitioner. Opium in all its forms is to be avoided. In the treatment of chronic gout attention must be paid to diet. Malt liquors are to be avoided, and the heavy wines, such as port and burgundy. There is no good reason why any particular form of food should be eliminated, but it is paramount that simplicity and undereating rather than overeating should be the rule. The so-called uric acid theory of gout is a pathological hobgoblin. Copious drinking of alkaline waters is of value—largely because of the water. Potassium salts seem to be of service. Above all a charitable and sympathetic attitude of mind must be cultivated. Gout frequently develops in people who have great power or who, unconsciously, would use it ill. The unconscious

criminal, or desire to master others, is a not infrequent situation in gout. This should be rooted out by psychoanalytic procedures.

**GOUTWEED, or GOUTWORT**, a kind of wild carrot (*Ægopodium podagraria*) introduced from Europe, where in England it is known as masterwort, herb-gerard, and now a rare weed in waste places along the Atlantic coast of the United States.

**GOVERNEUR**, goo'ver-nér, N. Y., village in Saint Lawrence County, on the Oswegatchie River, the Rome and Watertown Railroad, about 40 miles south of Ogdensburg. It has large marble works; the talc mines nearby are well developed, and considerable iron ore is mined, and woodpulp is manufactured. It is in a good agricultural region. Pop. about 5,000.

**GOVERNING METHODS.** See **INTERNAL COMBUSTION ENGINE**.

**GOVERNMENT** is the term used to describe the mechanism or *ensemble* of agencies through which a body-politic formulates and executes its will.

**Governments de facto and de jure.**—Since they act only as the agents of the sovereign political power, governmental agents in order legally to exercise the functions of their offices are obliged to possess a delegation of powers from the state they represent. In case they are not able to produce a sufficient evidence of this authorization, their acts are *ultra vires*, and as such of no legal force, and they themselves are subject to civil or criminal suit at the instance of parties whose persons or property they may have injured by their acts.

It not infrequently happens, however, that persons claiming political authority, while able to produce satisfactory evidence of their official status and competence, do so by referring to grants of power from a political sovereignty, the legitimacy of which is not admitted by the parties over whom their authority is attempted to be exercised. It thus becomes necessary to distinguish between governments *de facto* (*sed non de jure*) and governments *de jure*.

The terms *de facto* and *de jure* are applicable to governments in a purely relative sense. That is to say, which of the two is properly descriptive of a given political organization depends upon the point of view of those who characterize it. Thus a government is *de jure* as well as *de facto* when it has been established by, claims to represent and is in fact guided by the will of a state the legitimacy of which is recognized by the individuals over whom its control is extended. It is *de facto* but not *de jure* to any particular individual when, though actually in existence and able to exercise a certain amount of power, its legal character is denied by that individual. Thus in the case of an attempted revolution; from the standpoint of those who have repudiated their allegiance to the old state, refuse obedience to its government and have organized for themselves a new political machinery, the old government has but an actual and not a legal existence, the new government being the only one in their eyes possessing a legal basis. Upon the other hand, from the point of view of those who still support the old state, the newly established government has but a *de facto*

existence, the old government being conceived as the one legal organization. Thus, during the American Civil War, the existence of the Southern Confederacy as a state was never recognized by the United States nor by foreign powers. The existence of a *de facto* Confederate government was, however, admitted, and its soldiers recognized as belligerents. The continued allegiance of its supporters to the United States was, however, always asserted by the United States, and no legal force of any sort was ever ascribed, then, or after the end of the war, to any of its acts. No formal treaty of peace was entered into with the Southern Confederacy, the surrender of its armies being received simply as military acts, and its government permitted to go out of actual existence without any formal act to mark its demise.

**The Ethical Right of Governments to Exist.**—The concrete question as to the moral right of a particular government to exist and to coerce individuals is often confused with the abstract one as to the moral justification for the existence of political restraint in general. These two questions are, however, quite distinct, and are to be answered upon quite different principles. So long as men's interests conflict, or, at least, so long as they are conceived by them to conflict, coercion of some sort must result, for the desires of all, under such circumstances, cannot be satisfied. Some will have to give way to others, or all yield in part. The force bringing about the final settlement may be individual, social, political or religious, but in any case restraint is applied and the freedom of action of the individuals concerned correspondingly interfered with. This being so, it is clear that the question as to the ethical legitimacy of coercion by the state is not to be answered by viewing such coercion as a restraint upon individuals who otherwise would possess entire freedom of action. Rather it is to be viewed as a control of individuals who, but for the existence of political government and law, would be subject to the compulsion of other forces. In other words, so long as men's desires conflict there cannot properly be raised the abstract question as to the rightfulness of restraint humanly imposed, or even the question as to its proper amount. The conflict of desires makes coercion inevitable, and the extent of this conflict fixes its amount. The only questions, therefore, that rightfully may be raised are as to the form that the compulsion shall assume, and the general principles that shall guide it. The justification, then, for the existence of any particular political authority, if justification there be, consists in the fact that it furnishes a more intelligent, more beneficial, more just and less painful form of restraint than that which, in its absence, any other force or forces would supply. A state and its government is but an instrument humanly devised for a people's good. It, therefore, has to be justified by its works. There is, thus, no theoretical difficulty in conceiving of a political authority so corruptly and oppressively administered as to cause evils overbalancing those that it prevents. In such a case, it has no ethical right to be. Practically speaking, however, there can be no question but that so grievous are the inevitable evils of lawlessness and anarchy

that it is difficult to picture to oneself a political régime so evil in its effects as to render preferable to it a complete absence of political order.

To repeat, then, for the question so often stated in the abstract form as that of the right of the state to be should be substituted that as to the right of its government to be and to exercise the functions that it does and to exercise them in the manner that it does. As the author of this article has elsewhere had occasion to state it: "The right to be of the political authority itself is not in issue, for, abstractly considered, that is, as apart from any particular form of organization, or manner of operation, there is no basis upon which a judgment may be founded. It is not until the state manifests its power and authority that material is afforded to which moral estimates may be applied."

**The Doctrine of the "Consent of the Governed."**—We are now prepared to examine the meaning and validity of that doctrine, promulgated in the Declaration of Independence, and accepted as fundamental in American political philosophy, according to which all governments "derive their just powers from the consent of the governed."

Without stopping to consider what the founders of the American Union probably meant by this phrase, it may be here said that the principle stated by it has a validity only in so far as it is held to state or imply that all governments should be so administered as to promote to as high a degree as is possible the good of all the governed; and that, therefore, the governed have at all times the moral right—though not necessarily the legal right—to see to it that this is done, and consequently the right, if there be no better way, of overturning an existing government and establishing in its place one more likely to subserve their own general good. Impliedly, then, the doctrine properly means that every state should be so organized as to render possible and easy the discovery of the best interests of the governed. As, however, generally speaking, these best interests are most certainly to be determined by the intelligent wishes of those concerned, this means, in the first place, that, so far as the state itself is able to provide them, agencies should exist for developing the intelligence of its citizens and thus qualifying them to know their own best interests; in the second place that adequate provision should be made for the free expression by the people of their wishes; and, finally, in the third place, that sufficient guarantees should exist that these wishes when made known will be heeded by those in power.

That the foregoing requirements of an ethically defensible government may be satisfied, it is necessary that all public officials shall be held strictly responsible, politically and civilly, for the manner in which they exercise the powers entrusted to them; that freedom of speech and press shall prevail; that the rights to petition, to assemble peaceably and to bear arms shall exist; and that political privileges—the suffrage and the right to be elected or appointed to public office—shall be as widely extended as the intelligence and morality of the citizens will permit. Speaking negatively the doctrine of the "consent of the governed"

does not support the legal right, nor, except in extreme cases, the moral right, of each individual citizen to refuse obedience to particular laws which he may consider unjust, nor at will to cast off his allegiance to his state, nor to claim the suffrage or public office as an abstract right.

The ethical right of one people forcibly to subject another people to its political authority, that is, to destroy the sovereignty of its state and annex its territory, as, for example, the right of the United States to control the political destinies of the Filipinos, or of England to extend her authority over the peoples of the South African Republic (Transvaal), and the Orange Free State, is a somewhat different question from that of the right of a particular government to exercise a control over its own citizens. There is an exceedingly strong presumption not only that a given people best knows its own interests and the means of advancing them, but that, stimulated by the consciousness of national independence, it will develop its latent potentialities in a manner that it will not, or cannot, do when subjected to an alien authority. But this presumption, however strong, is one that may be rebutted. It may be made sufficiently plain that a people, because of a lack of intellectual and moral development or a deficiency in natural ability and temperament, is not able either to perceive its own best interests or so to govern its conduct as to realize them when perceived; or, in determining upon its domestic or foreign policies, to give sufficient weight to the moral and legal rights of other states and their citizens. The interests of civilization are superior to those of any particular people. Judged from this general standpoint, it may, therefore, often happen that the forcible subjection of one people to the political rule of another is justified. This right of course appears most plainly in the case of the subjection of an uncivilized people to a civilized nation, but is not necessarily limited to such a case. The continued unsatisfactory political conditions existing among many of the peoples of South and Central America, of the races inhabiting the Balkan Peninsula and of the whole of the Turkish dominions certainly furnishes to the other states of Europe and America a very strong basis of right to intervention. The language of Prof. J. W. Burgess is hardly too strong when, after adverting to the fact that it is in the interest of the world's best civilization that law and order and the true liberty consistent therewith shall reign everywhere upon the globe, he declares that "a state or states, endowed with a capacity for political organization, may righteously assume sovereignty over, and undertake to create order for, a politically incompetent population."

**Classifications of Governments.**—As many different classifications of governments may be made as there are characteristics of governments suitable for selection as differentiating elements or factors. The best known of these possible classifications is the one that has come down to us from ancient times, which divides the various kinds of political organization into three main classes, according as the supreme political control is in the hands of a single individual, in which case the government is known as a monarchy; in the hands of a few persons, when

it is described as an aristocracy; or in the hands of the general citizen populace, when it is termed a democracy. A further or sub-classification divides each of these three types into normal and corrupt forms, the corrupt monarchy being termed a tyranny, the corrupt aristocracy an oligarchy, and the corrupt democracy an ochlocracy or mobocracy. A still further subdivision divides monarchies into elective and hereditary according to the source whence the monarch derives his right to office; and into absolute or limited (or constitutional) according as the monarch in the exercise of his authority is, or is not, controlled by definite constitutional principles and by the action of other governmental officials selected by the people; aristocracies into particular types according to the principle, wealth or birth, upon which membership in the ruling class is determined; and democracies into direct and indirect according to whether their people directly participate in the control of the state or delegate the exercise of their sovereign powers to officials selected by and responsible to themselves. In the latter case the government is known as a representative democracy or republic. The Constitution of the United States, without defining the term, provides that: "The United States shall guarantee to every State in this Union a republican form of government." The Federal courts, though they have several times been called upon to construe and apply this clause, have never attempted directly to determine the meaning of the term "republican form of government." The eminent constitutional jurist, Judge Cooley, gives, however, the following definition which has been generally accepted as correctly expressing the meaning of the phrase as employed in American law and American political thought:

By republican "government, he says, "is understood a government by representatives chosen by the people, and it contrasts on one side with a democracy, in which the people or community as an organized whole wield sovereign powers of government, and on the other with the rule of one man, as king, emperor, czar, or sultan, or with that of one class of men, as an aristocracy. In strictness, a republican government is by no means inconsistent with monarchical forms, for a king may be merely an hereditary or elective executive, while the powers of legislation are left exclusively to a representative body freely chosen by the people. It is to be observed, however, that it is a republican form of government that is to be guaranteed; and in the light of the undoubted fact that by the Revolution it was expected and intended to throw off monarchical and aristocratic forms, there can be no question but that by a republican form of government was intended a government in which not only would the people's representatives make the laws, and their agents administer them, but the people would also, directly or indirectly, choose the executive. But it would by no means follow that the whole body of the people, or even the whole body of adult or competent persons, would be admitted to political privileges; and in any republican state, the law must determine the qualifications for admission to the elective franchise.

Another term, often used as synonymous with democracy, is popular government. Strictly speaking, however, this latter term should be employed not to designate any distinct form of political organization, but to describe any government the actual administration of which is to a considerable degree subject to the control of the people. A popular government is thus, in effect, a free government and as such is properly to be contrasted with a despotic government in which the will of the ruler or rulers and not that of the ruled controls. It is in this sense that we speak of the movement toward popular government as having made great

strides in England and elsewhere during the last 75 years, though monarchical forms have still been retained.

**Constitutional Government.**—So closely connected with the advance of popular government, as to be almost identified with it, has been the development during the last century of constitutional government. Those general principles, written or unwritten, that determined the governmental organization of a state and fix the legal competence of its several organs and officials, taken collectively, are termed its constitution. In this sense every state has a constitution, and its government may be spoken of as constitutional. But in its stricter and more usual sense, a constitutional government is one in which the principles determining its specific character, and the extent and mode of exercise of its powers, are definitely determined, and, in general, reduced to precise written statement, and embodied in an instrument or instruments which are not subject to abrogation or amendment except according to certain specified formalities. By this means not only are definiteness of authority, and responsibility of those in power secured, but guarantees provided that existing political liberties shall not be changed except under conditions which usually include a popular assent directly or indirectly given. The value of constitutional government is thus usually but not necessarily that in it the exercise or the direct control of sovereignty is placed in the hands of the people. Its essential feature is that the manner in which the sovereign power is to be exercised by the state is definitely determined. A constitutional government may, therefore, both in form and effect, be but slightly popular in character. In fine, then, the difference between a constitutional and a popular government is that in the former the attempt is made to render the citizens secure against arbitrary action on the part of their rulers; in the latter, means exist for discovering and enforcing the wishes of the governed. The progress of popular government and of constitutional government has almost always gone hand in hand, for the reason that it is but natural that, once established in the effective control of their states, the citizen bodies should have sought to render their power secure by the adoption of instruments of government that might not be altered except under certain prescribed conditions.

The truest tests of the excellence of all governments are the facilities they afford for the formation of an enlightened opinion of the people upon matters of political importance and the precise ascertainment of that "general will" when formed, and the exactness with which the policies it dictates are carried out in practise. The development of popular constitutional governments means that these results are being achieved to an increasing extent. As Prof. Lester F. Ward has said: "Government is becoming more and more the organ of social consciousness, and more and more the servant of the social will. Our Declaration of Independence, which recites that government derives its just powers from the consent of the governed, has already been outgrown. It is no longer the consent, but the

positively known will of the governed, from which government now derives its powers."

A characteristic feature of almost all constitutional governments is the existence of a system of what has been called "checks and balances." According to this system the several functions of political rule are so distributed among different organs of government that no one of them is given sufficient power to assume an autocratic, despotic control of the state. Thus, in general, the making, the interpreting and the enforcing of laws are placed in different hands. The executive is thus unable to take legal action without the authorization of the legislature, and the acts of both the legislature and executive are subject to review in the courts. Furthermore, the legislative body is usually divided into two chambers, the approval of both, together with that of the chief executive, being required for a valid act of legislation; executive officials are often elected for but short terms of office, and in case of non-feasance or malfeasance of office are subject to impeachment and summary removal from office, and subject to civil and criminal suit for any illegal conduct while in office. In the United States of America the most powerful check of all consists in the fact that the courts have the power of declaring void all legislative acts inconsistent with the provisions of the written constitutions of the United States and of its constituent commonwealths. In those European states which possess written constitutions the courts have not this power, the legislatures being construed to be the judges as to the constitutionality of their own acts.

**Presidential and Parliamentary Governments.**—A very important classification of constitutional governments is that which divides them into Presidential and Parliamentary.

Presidential government, to accept the excellent definition of Burgess, "is that form in which the state, the sovereign, makes the executive independent of the legislature, both in tenure and prerogative, and furnishes him with sufficient power to prevent the legislature from trenching upon the sphere marked out by the state as executive independence and prerogative." Thus the governments of the United States and of Germany are of this type. Upon the other hand, "Parliamentary government is that form in which the state confers upon the legislature the complete control of the administration of law. Under this form the legislature originates the tenure of the real (though perhaps not the nominal) executive, and terminates it at pleasure; and under this form the exercise of no executive prerogative, in any sense and manner, unapproved by the legislature, can be successfully undertaken." As further descriptive of this parliamentary type it should be said that this controlling power thus vested in the legislature almost inevitably tends to become concentrated in its more popular chamber. The government of England best illustrates this form of government. That of France may also be placed in this category. Because the real executive power in a parliamentary government is almost always in the hands of a cabinet of officials holding office only so long as they are able to retain the support of the legislature, this form

of political rule is often spoken of as Cabinet government.

**The Sphere of Government.**—The legal power of a constitutional government at any given time is determined by law. The sphere of political control thus marked out includes all those interests which the state has determined require public control. As we have already learned, legally the state is omnipotent, and therefore may subject to its regulation any matter that it sees fit. Actually, however, considerations of utility and expediency of course control. Regarding the exercise of certain powers, no opportunity for the employment of discretion exists. In order to maintain itself as a sovereign, independent body-politic, it is absolutely necessary that the state should obtain sufficient means, and exercise sufficient authority, to protect itself against attacks from foreign sources, and to maintain law and order, that is, to protect persons and their property throughout its own dominions. The powers, the exercise of which is thus called for, may, therefore, be termed "essential powers," and in the aggregate they constitute the essential sphere of the state. By some writers they are spoken of as "police powers." German writers, however, it should be said, use this term somewhat differently, designating as a "Police State" (*Polizeistaat*) one that English and American writers denominate a "Paternal State." The propriety of the exercise by the political power of these essential duties is not denied by any one except the anarchist. Contrasted to these essential, or, to use the adjective employed by President Wilson, the "constituent" functions of government, which must be exercised by a state in one way or another, are what may be called the non-essential or ministrant functions which all civilized states to a greater or less extent exercise. The activities included in this class are those performed by the state for the promotion of the economic, physical and moral welfare of its people.

As not being absolutely essential to the very existence of the state, there are many who while admitting the necessity for, and the rightfulness of, political control in matters of police protection and national self-defense, assert that the assumption by the state of a right thus further to control the conduct of its citizens is an ethically unjustifiable interference with their freedom, even though the aim of such interference is to advance their own good. In order to maintain this position, however, they are obliged to fall back upon a doctrine of "natural rights," the invalidity of which is now all but universally recognized. Starting, as from a premise, with the right of a particular state or government to be, as determined by the principles already laid down in this article, the conclusion necessarily follows that, in each individual case, the question whether or not a given matter, whatever its character, shall be subjected to public control, is one the answer to which should be determined wholly by expediency—construing of course expediency so as to include moral as well as material considerations. The arguments of those who urge the establishment of a socialistic or communistic régime are, therefore, not to be met by the simple predication of an abstract individualistic, *laissez-faire* doctrine, according to which an

extension of state activities beyond the mere maintenance of order and national independence is ethically unjustified whatever the results to which it may lead. The claims of socialists and communists, in other words, may properly be rejected only by showing that the actual results to which their proposed policies, if adopted, would in all probability lead, would be ethically unjust, or economically disastrous, or both.

This is not the proper place to discuss either socialism or communism. This one observation may be made, however, that the performance by the state of non-essential duties is not, in very many cases, a step toward socialism. The essential aim of socialism is to suppress competition. When there is assumed by the state a function which otherwise would certainly, or in all probability, not be performed at all, it can hardly be said that the field of private initiative is thereby lessened. Under the head of these non-essential, non-socialistic duties, may be grouped all those state activities that are educative rather than coercive, informative rather than controlling. Of this character, for instance, is almost all of the work done in the Departments of Labor and Commerce, and of Agriculture, the Bureau of Education, the Fish Commission and other scientific bureaus of the United States government.

As to what the actual sphere of government in America and Europe is destined to become within the next few years we, of course, can only speculate. The probabilities, however, would seem to be that we are to see a considerable extension of state activities in the sphere of these non-essential, non-socialistic functions. The movement in this direction has for some time been very pronounced and is certainly one not to be deprecated. In the field of socialistic activities, namely, those the exercise of which by the state almost necessarily involves a corresponding diminution of the field of possible private enterprise, the greatest extension of public control within the immediate future will in all probability be seen in the assumption of the ownership and control by central and local governments of the so-called natural monopolies, and in the regulation by law of privately owned and managed industries in which the interests of the general public have become pronounced. Whether the movement toward increased governmental control in this last respect will proceed as rapidly as it has done during recent years one cannot say. The observation may be made, however, that, together with those forces, which, born of the increasing complexity of our social and economic life, tend to make necessary an extension of the activities of the state, there are other agencies the influence of which may be in the opposite direction. Out of an increased intellectual enlightenment and a more widely diffused spirit of altruism may easily arise both an increased ability and a stronger disposition to solve social and economic problems without a resort to the coercion of law. See STATE.

**GOVERNMENT BY INJUNCTION,** a term used to characterize the putting down of strikes by judicial power of laying injunctions. The first direct interference of the national government in labor troubles was the dissolution of the great Pullman strike at Chicago in 1894, on the ground that it interfered with the carrying of United States mails. This was an executive act; but the courts have since interfered in cases where violence was making the transaction of government business impossible, and brought irresistible government power to bear.

**GOVERNMENT PAWNSHOPS IN FRANCE.** Historical.—We must go back to the Middle Ages to find the first French banks loaning money on pledges. The Jews, who controlled these establishments, carried on this form of business on lines in which usury played a prominent part. They demanded the deposit of pledges representing double the amount of the loan, and exacted interest at a rate as high as 10 per cent per month.

From a very early period, the royal authorities became acquainted with these abuses and took steps to repress such illegal practices. The first royal decree dealing with the matter was drawn up by Philippe Auguste in 1218. This decree authorized the Jewish bankers to lend money on pledges, and merely limited the interest to be charged to two deniers per livre (\*) per week—that is to say that it was still more than two-fifths of the principal—on sums of money which could not be loaned for more than a period of one year. As the bankers of those days did not respect the terms of the royal decree they were expelled in the year 1226 and replaced by Italian bankers, hailing from Piedmont. These money-lenders profited by the aforesaid decree of 1218 in return for the payment of a certain sum as a license.

The first so-called pawnshop instituted in a French town really having the character of a lending establishment was founded in 1557

at Avignon, capital of the Comtat-Venaissin, at that time under papal domination. Three towns followed the example of Avignon:—Aix, Montpellier and Marseilles, in 1635, 1684 and 1694, respectively. The establishments profited by the decree issued by Marie de Médicis, after the States General had sanctioned in 1694 the creation of pawnshops in every town of the kingdom where such institutions seemed likely to be of public utility. The schemes for the establishment of pawnshops were much delayed owing to lack of capital on the one hand and to illegal activities of powerful adversaries on the other, the latter being fully aware that any new organization would at once put an end to their usurious practices.

On 9 Dec. 1777, Necker drew up the first letters patent for the establishment of the Paris pawnshop. In this document it is stated, *inter alia*, "A pawnshop, or general office whose business it is to loan money on pledges, would appear to be the best means of suppressing that kind of usury which was only too frequently the cause of the ruin of many families." According to the aforesaid document, all profits resulting from such business were to be applied to the relief of the poor. All cash in hand, with the exception of the sums to be paid to the "Régie" (state administration) and those necessary for the administration of the pawnshop, were to be handed over to the General Hospital. It will be shown during the course of this article that the lien existing between the pawnshop and charitable institutions still exists in modern pawnshops, resulting in partially paralyzing their natural evolution. The success of the Paris pawnshop was so great, that although created without capital, it obtained all the funds required to carry on its business and was able to make loans on pledges to the public during the period 1778 up to the outbreak of the Revolution in 1789, amounting to nearly 200,000,000 livres, or a yearly average of more than 15,000,000 livres. The Revolution, however, put a stop to the development of this promising start, and in 1793 the Paris pawnshop was compelled to suspend its operations. The perfect freedom of financial transactions which had been decreed by the convention of 11 April 1793 provided an opportunity for the usurious bankers, who had not entirely ceased their operations, to recommence their corrupt practices on a larger scale and to charge interest, which had previously been limited to 18 per cent per annum when pawnshops were established, to a rate which soon reached 20 per cent per month. During the Directoire period, the Paris pawnshops endeavored to recommence their operations, but the results were far from satisfactory, due in no small measure to the competition of independent firms. It was during the Consulate that the idea of making pawnshops a state monopoly originated. In a report drawn up by Regnault de St. Jean d'Augley it was stated:—"If, in general, all social transactions ought to be free, there are, however, some which should be governed by special rules in the common interest, so that the public may be protected and not become victims of avarice." These ideas took shape and a law was passed on the 16 Pluviose Year XII (6 Feb. 1804). In the following pages we will outline the main points of this law, which constitutes to the present day the legal basis for

\*Currency of the epoch.

the operation of government pawnshops in France.

**General Legislation Governing Pawnshops.**—Article 1 of the law of 16 Pluviose Year XII is formal:—No pledging establishment can be founded unless the government's authorization be obtained, and its profits applied to the relief of the poor. In order to make it quite clear that it is a state monopoly, article 2 provides for the closing of any establishment, which, during the six months of promulgation of the law has not been authorized as prescribed in article 1, and such establishment must cease its operations and wind up its affairs within one year. The law contained all the necessary powers to inflict heavy penalties on offenders, who could be prosecuted before the police tribunals and condemned to a corporal penalty ranging from 500 francs to 3,000 francs (\$100 to \$600), which could be doubled in case of a second offense. These sentences were independent of confiscation in every case of the goods given as security.

The Empire period (1804), which succeeded the Consulate, ratified the application of the law by a decree of 24th Messidor, Year XII (13 July 1804) providing as follows:—(a) the conditions under which the total reimbursement must be effected of the sums paid by the shareholders into the funds of the pawnshops and their elimination from the administration of the establishment; (b) the administrative organization of the Paris pawnshops; and (c) the rules to be followed by the departmental prefects for the organization of pawnshops in places where they would likely to be of public utility, and for the closing of independent firms in such places.

The privilege of making loans on pledges thus organized in favor of pawnshops is still protected by article 411 of the Penal Code which enacts, against those who have kept or established pledging houses, a term of imprisonment amounting to 15 days minimum and three months maximum, apart from a fine ranging from 100 francs to 2,000 francs (\$20-\$400). The old régime restored by the law of 16 Pluviose and the supplemental decree of Messidor was still further completed by a decree of 8 Thermidor, Year XIII (27 July 1805).

This decree, after prescribing the reimbursement without delay of the shares of the pawnshops, determines the regulations under which the Paris pawnshops will operate thereafter. It is this general regulation which still fixes the principal conditions for the carrying out of loaning operations by pawnshops, and which we will outline in the future in this article. For the present suffice it to say that the terms of the Thermidor decree, by articles 55 and 56, laid down the method of remuneration to be received by the pawnshops from the borrowers, the rates of such remuneration being made up on the one hand, of the interest on the sums lent, and on the other of the expenses of valuation, deposit of security and other general administration expenses. The law of 24 June 1851 defined the legal status of pawnshops and outlined the measures to be taken for better administration. By virtue of this law, pawnshops were recognized as being establishments of public utility, and were governed by the regulations applying to public utility establish-

ments in general, as laid down in the decree signed by the President of the French Republic. The board of directors of pawnshops is presided over by the mayor of the commune, and by the prefect for the department of the Seine for Paris. For Paris the directors are nominated by the Minister of the Interior, and for the departments by the prefect. They are chosen as follows:—one-third from amongst the members of the municipal council, one-third among the directors of charitable institutions, one-third among other citizens domiciled in the commune. One-third of the members are renewed each year. The retiring members may be re-elected. The decree determines the organization arrangements for each one of the pawnshops and the conditions for their management. The manager of a pawnshop, where such exists, or the responsible official, is nominated by the Minister of the Interior, or by the prefect, on the recommendation of the board of directors. In case of refusal by the Minister of the Interior or the prefect, the board of directors is requested to nominate another candidate. The dismissal of the manager is sanctioned by the same authorities. The pawnshops are, as regards their accountancy department, assimilated to charitable institutions, that is to say, they are considered as being governed by the same regulations as the latter.

The endowment of each pawnshop is regulated by article 3 of the law of 1851, and is composed of:—(a) real and personal estate serving for its establishment and those of which it is, or may become later, proprietor; especially donations and legacies; (b) profits and bonuses shown by the annual inventory and capitalized; (c) subsidies which may be granted them out of the communal funds of the department or of the state.

Pawning transactions are effected from:—(a) funds available from the endowment reserve; (b) those obtained by way of loan or which are paid as interest into the treasury.

The conditions of the loans are fixed each year by the administration subject to the approval of the Minister of the Interior or the prefect as the case may be. When the endowment is sufficient either to cover the general expenses or to lower the interest to the legal rate of 4 per cent, the excess receipts are allotted to hospitals or other charitable institutions, by decision of the prefect acting on the recommendations of the municipal council.

A public administrative regulation deals with the appointment and supervision of the intermediary officials nominated to the management of pawnshops. The law of 1851 not only dealt with questions concerning the organization of pawnshops, but prescribed in detail under what conditions the borrowers were authorized to demand the sale of their pledges. Every depositor, after a delay of three months from the date of the deposit, has the right to demand, on the dates of sale fixed by the regulations, the sale of his pledge, before even the date noted on his ticket. The price of the article is handed without delay to the borrower-proprietor thereof, after deduction of the interest due and the amount of expenses fixed by the regulations. New merchandise given as pledge can, however, only be sold after the expiration of one year. Titles of debt, tickets and documents appertaining to the administration of

pawnshops are exempt from fiscal taxes and stamp duties under the law of 1851. This law, however, stipulates that with the exception of exemption from taxes, none of its clauses are applicable to pawnshops established on a purely charitable basis, and which, by means of donations or special endowments, lend money gratuitously or at an interest lower than the legal rate. A transitory article of the law of 1851 provides that the terms of the law shall be applicable to those existing pawnshops which have been founded as pawning establishments as distinct from all others.

The state council, on being consulted regarding the scope of this transitory text, expressed the opinion that it was necessary to divide the pawnshops into three categories:—

(1) those established on a purely charitable basis and which by means of special endowments lend money gratuitously or at an interest lower than the legal rate; (2) those lending money neither gratuitously nor at an interest lower than the legal rate are authorized to retain their excess receipts to constitute or increase their endowments; (3) those lending money neither gratuitously nor at an interest lower than the legal rate pay all or part of their excess receipts into the funds of the charitable institution under which they were founded.

The state council afterward defined the expression "pawning establishments as distinct from others" to the effect that such term was intended to designate pawnshops previously authorized to retain their excess receipts for the purpose of constituting or increasing their endowments; but the law of 1851 could not affect the privileges of the charitable institutions which profited wholly or in part by the excess revenues. As a result of this interpretation, very few of the pawnshops connected with charitable institutions by common interests were able to free themselves from this financial control, which unquestionably hindered their evolution in the way of reduction of tariffs.

The regulations for loans on corporal guaranty is still further defined by the decree of 24 March 1852, and especially by the general rules dated 30 June 1865, the principal provisions of which will be outlined in the first paragraphs of Part II. This decree of 1865 divided, in particular, all pawnbroking businesses into two categories:—firstly, individual firms, the funds necessary for the carrying on of whose business is provided by a single treasury and who have one office only for the transaction of each particular kind of business with the public; secondly, compound pawnbroker's enterprises, the variety and extent of whose transactions either necessitate the establishment of branches or auxiliary offices, or several offices, sections or treasury centres. The pawnbroking business carried on in Paris falls under the latter category. Finally, a law dated 25 July 1891 authorized the Paris pawnshops to loan money on certain fully paid-up scrip to bearer, no operation, however, to exceed an amount of 500 francs (\$100) per borrower. The same law empowers the government to extend, by decree in the form of regulations concerning public administration, the same authorization to such provincial pawnbrokers' enterprises as the government shall deem to be in a position to fulfil the requirements prescribed for this kind

of business. It is no longer a question, as regards loans on scrip, of an exclusive privilege as in the case of loans on corporal security, but of a simple right, limited and carrying with it different facilities, to do business concurrently with banks and other banking establishments.

**Pawnbroking Operations.**—Every application for a loan on corporal security is subject to various formalities including: Valuation of the pledge to be given; offer and acceptance of the loan; the drawing up of a statement of appraisal; official pawnticket; various entries on the books of the deposit office; proofs or authentications required by the regulations; the payment of the loan and delivery of the corresponding pawnticket, or suspension of the payment and delivery of a document respecting the pending loan, or the cancellation of the operation and restitution of the pledge.

In Paris, the valuation of pledges is effected for pawnshops by the public appraisers of the department of the Seine. There are in all 20 of these public appraisers. According to the rules under which they carry out their duties, they have the right to choose their assistants, for whom they are responsible, although they cannot issue official documents without the consent of the administration. The "Compagnie des Commissaires Priseurs" (public appraisers) is responsible to the pawnshops for the results of the valuation and if the proceeds of the sale of a pledge are not sufficient to cover the amount loaned, said compagnie must make up the difference between the price realized by the sale and the valuation on which the loan was based. In the provinces, notably at Lyons and Bordeaux, the valuation is effected by public appraisers also. This, however, is not always the case, as at Lille for instance the appraisal is made by competent valuers attached to the pawnbroking staff. Furthermore, commission agents established in Tourcoing, Armentières, Hallum, Coumunes and Estaires are attached to the Lille pawnshop. Finally, at Nice another system exists, the two pawnshops in this town advancing money gratuitously on gold and silver articles only. The appraisal is made by a jewelry expert attached to the administration, by whom he is remunerated. The amount of the possible advance is fixed according to valuation, and a deposit-receipt to bearer is given. The limit of loans based on the valuations is fixed as follows: For silverware, gold or jewels, four-fifths of the value by weight; for all other articles, two-thirds of their value. The minimum of loans is three centimes and the maximum is unlimited. Loans are made for a period of one year. The foregoing are not, however, the only regulations provided in the decree of 8 Thermidor Year XIII (27 July 1805). For instance, by virtue of article 49, should a doubt exist as to the identity of the depositor, or his legitimate ownership of the articles, or his right to dispose of the goods, the payment of the loan may be temporarily suspended pending inquiries. The borrower has the option, however, of giving surety as to his identity. As the loan document must bear a signature, if the borrower is unable to write, such document may be signed by a responsible party known to the pawnbroking authorities.

**Redeeming of Pledges.**—If at the expiration of the period noted on the loan document, or

before that date, or even after such date, so long as the sale has not been effected, the borrower presents the pawnticket and settles his debt in full, i.e., principal, interest and expenses, his property is restored to him. (Regulations of Year XIII (1804-05) modified by article 69 of the law of 30 June 1865). Any respite from sale allowed to the borrower, at his request is not suspensive of the rates of interest. The rate of interest and administrative expenses payable by borrowers are fixed every six months by prefectorial order, but such rate of interest must never exceed 12 per cent (decree of 24 March 1852). In 1913, the Paris pawnshops charged 3½ per cent interest, the same rate for administrative expenses, plus a special tax of 1 per cent which is always payable whatever the duration of the loan, or a total of 8 per cent. If the borrower loses his pawnticket he cannot redeem his property until the due date of expiration. He must then give a special release, testified to by a responsible resident householder.

**Renewal of Loans.**—When the borrower is unable to redeem his loan and desires to avoid the sale of his property, he can demand the renewal of the loan on the same terms as to interest and duration. No renewal, however, will be granted unless all taxes and interest to date are paid, such sum being calculated on a redeeming basis. The pawnshop is authorized to have the pledge revalued, and if it has declined in value the borrower may be called upon to reimburse a part of the loan. A new valuation is obligatory for the following articles: (1) Shawls and woolen goods on which a loan of .50 francs (\$0.10) or more has been made; (2) pledges which by special orders and provisionally would no longer be accepted for renewal if this formality is not fulfilled.

It is also obligatory for any articles on which a sum of 1,000 francs or more has been advanced. By virtue of article 81 of the Regulations of 30 June 1865, a borrower renewing his loan may demand to see his pledge so as to satisfy himself as to the proper state of preservation of his property. The Montpellier and Douai pawnshops do not grant renewals, but they give every facility for payment.

**Reimbursement by Instalments.**—Borrowers have the option of redeeming their loan before its expiration, by instalments, which, however, must not be less than an amount of one franc and which bear interest at the same rate as that charged by the pawnshop.

These instalments constitute what is called a savings-account, and may be used for the partial liberation of the loan, or the renewal thereof.

Payments made by instalment do not, however, prevent the property from being sold on the expiration of the loan, even if the amounts paid are equal to the sum loaned. The administration is under no obligation to supervise these operations and it is, therefore, incumbent on the borrower to take the necessary steps to redeem his pledge or renew the loan, otherwise his property will be sold.

**Sales.**—Should the loan not be redeemed or renewed at due date, the pledge is sold. Sales take place after the drawing up of an order for pledges to be realized, which order becomes publicly effective upon executive order of the president. Sales are publicly announced 10 days in ad-

vance, and the borrower is also advised when the amount of the loan exceeds 16 francs. No opposition can be made to the sale, but if the borrower so requests, the administration usually grants a respite of three months. Sales are always subject to the supervision of public appraisers, even at the gratuitous pawnshop of the "Fondation Mazurel" of Lille. An exception exists, however, in favor of the gratuitous pawnshop of Nice, where sales are made by sworn experts assisted by the director of the pawnshop, the justice of the peace and the comptroller. As previously stated, if the amount realized by the sale is insufficient to reimburse the pawnshop, the public appraisers must make up the deficit between their valuation and the sale price.

As we have pointed out in Part I, par. 2, the law of 24 June 1851 lays down the conditions under which borrowers are authorized themselves to apply for the sale of their security.

**Bonuses.**—The proceeds of the sale are utilized in the first place to reimburse the pawnshop. If there is any excess it is called a "boni" or bonus, and must be paid over to the borrower (Regulations of 30 June 1865, art. 92). These bonuses are held at the disposal of the parties interested, but if not claimed within three years they revert to the administration (article 93 of same regulations). A claim for a bonus must be accompanied by the pawnticket to bearer. It is not the business of the pawnshop officials to inquire by what means the pawnticket came into the possession of the party presenting it unless it forms the object of a legal attachment. Duval, 'Manuel de Législation,' § 1727.

**Nature of the Privilege.**—Although the privilege of making loans on personal security is reserved for pawnshops it must not be concluded that this is absolutely exclusive. The Civil Code devotes an entire chapter (articles 2073 and following) to the regulations governing the constitution of a private security. But the prescriptions of the Civil Code are very severe and little suited to facilitate this kind of transaction. A public act, or act by privy seal, registered, is required except in cases where the transaction does not exceed a sum of more than 150 francs. Moreover, the secured creditor may obtain payment preferentially on the effects constituting the security, but in this case he must obtain an order from the courts that such effects shall remain his property in payment, and this up to the amount of a valuation made by experts, or that such effects be sold by auction. These protective measures are not, however, the only ones prescribed by the law. Loans on security made between private parties must be distinct and separate transactions, for, as we have pointed out, article 411 of the Penal Code deals severely with persons carrying on business in non-authorized loaning establishments. Jurisprudence has always given the broadest interpretation to the clause contained in the Penal Code in this respect, admitting, notably, that the fact of having loaned money to several people without opening a duly authorized loaning establishment (even without interest) is sufficient to render one liable to the penalties stipulated in article 411 of said Penal Code. On the other hand, pawnshops enjoy an especially favorable régime, such as immunity from fiscal charges

and stamp duties, and above all they have the right to sell the articles deposited as security without being obliged to observe the prescriptions of article 2078 of the Civil Code. It must be admitted that the privilege for making loans on security granted to pawnshops gives them a veritable monopoly in this respect, even as regards the constituting of a private security.

**Loans on Personal Estate.**—The law of 25 July 1891 was not made with the object of allowing pawnshops to encroach on credit or banking houses by authorizing them to loan money on personal estate security, the property of the bearer. The maximum fixed for these transactions, limited to 500 francs (\$100), proves at once that the law merely desired to assist small property holders who had made safe investments, the limited nature of which does not interest large banking concerns, and the facilities granted by pawnshops to undertake this kind of business are more in keeping with the momentary needs of small capitalists. The amount of the advances is calculated on the official rate of the Bourse, taking as a basis the last rate for cash transactions of the preceding day. The amount of the loan is fixed in the following proportions: (1) French rentes, treasury notes and bonds, 80 per cent; (2) securities bearing annual interest and deemed by the prefectural authorities to be good holdings, 75 per cent; (3) "Actions de jouissance,"\* 60 per cent.

The borrower can be called upon, during the duration of the loan, to refund part of the loan if the Bourse rate drops at least 15 per cent, such refund to be made eight days after receipt of notice by registered letter. In case of a drop in the market rate the pawnshop has the right to sell the security on the Bourse in the absence of partial reimbursement, or in the absence of total reimbursement on the expiration of the loan, without being obliged to notify the borrower or carry out any formality. Any deficit resulting from the sale is payable by the borrower; if there is a profit, it is kept at his disposal for 10 years, counting from the date of the sale. After this lapse of time any unreclaimed profit reverts to the pawnshop. The financing of loans on personal security must be effected by means of capital distinct from that used for loans on corporal security. All the clauses contained in the regulations which govern pawnshops and are not contrary to the law of 1891 are applicable to transactions concerning loans on scrip.

**Responsibility of Pawnshops in Case of Loss of Goods Pledged.**—The Decree of 8 Thermidor Year XIII (27 July 1805) gives borrowers who have not exceeded the date limit fixed for the sale of their pledges the right to claim an indemnity if their property is not restored to them. This indemnity is based on the estimated value of the property at the time of deposit plus one-quarter thereof. (Article 60 of the General Regulations of said Decree). As a general rule, no other claim can be made by the borrower. Exception, however, is made in the case of loss of the pledge as the result of fraud or gross negligence on the part of an employee. In such case ordinary law becomes applicable and the courts decide the amount of

indemnity to be awarded, due consideration being taken of cases of "force majeure" when such exist.

The risks of safe keeping of pledges, principally fire, must be covered by the pawnshop, and by virtue of article 67 of the Thermidor Decree all real estate and working capital may be held to constitute the guarantee for depositor's pledges.

**Resources and Present Situation of Pawnshops.**—No pawnshops, with the exception of those of Arras, Besançon, Boulogne-sur-Mer, Douai and Nancy, possess sufficient funds of their own, and they are obliged to borrow to meet their business needs. The working funds of these establishments are derived from annual loans made to them under decree of 8 Thermidor Year XIII. In Paris, loans are effected as required by voluntary deposits of sums of a minimum of 100 francs (\$20). The rate of interest on such investments is fixed yearly, or oftener if any modification is necessary, under the ruling of the prefect of the Seine after approval by the Conseil de Surveillance. (Decree of 25 March 1852, art. 7). Different rates are fixed, based on the date of expiration of the "Bons" (notes) delivered to the security-holders, which notes may be discounted by the pawnshop. To these sums should be added amounts paid to the pawnshops as "cautionnements" (surety) and deposits.

As regards gratuitous pawnshops, they derive their funds from foundations or gifts made to them. These establishments form, however, an exception, as we have already pointed out. The present status of pawnshops in France, or let us say their status before the war, can be seen from the general statistics published in 1910, which are given in another part of this article.

**GOVERNMENT PRINTING OFFICE, United States,** established in 1861 as the official printing and publishing plant of the United States government, occupies a seven-story fireproof brick building in Washington, D. C., built for it in 1902. Its frontage is 408 by 175 feet on two streets and it has an interior court, 30 by 167 feet. An annex later built in corresponding height and style houses the office of the superintendent of documents. Connection with the adjoining city post-office enables it to deliver its enormous mail shipments there direct from the workrooms. A vault capable of storing 2,000,000 electrotype and stereotype plates extends out under the street pavements. The main building was put up under an appropriation of \$2,249,000. It has its own power plant and individual motors, without belting or shafting, operating all machinery, elevators, etc., throughout the building. It is equipped with linotype and monotype machines and with all other devices, apparatus and machinery to enable it to turn out at the highest grade and in the largest quantity, and especially with the greatest rapidity, a great variety of work, including bound books, pamphlets, periodicals, forms, specifications, ledgers, loose-leaf binders, envelopes, money-order blanks, postal cards, catalogue cards, in fact, every kind of job printing, binding and book making that Congress and the government offices can use or issue. It is fitted with every device for the aid, safety and comfort of the workers, including automatic

\*Such shares do not exist in English or American companies. Sometimes they are translated by the term "dividend shares."

carriers pneumatic tube distribution, electric fans, bubbling fountains of cooled and filtered water and a complete hospital with medical attendance day and night. The cost of the machinery in use 30 June 1915 was \$2,475,538.86.

The Government Printing Office employs about 4,000 workers, of whom about one-third are women. It runs continuously day and night, especially while Congress is in session. The title of the head is Public Printer. He is appointed by the President, but reports to Congress. All other employees are appointed by him, under examination and regulation by the Civil Service Commission. Although most of the workers belong to unions, yet the government has affirmed it to be an open shop. The only supervision is by the Joint Committee on Printing of the two houses of Congress, under which body the office contracts for paper, and which body has power "to remedy any neglect or delay in the execution of the public printing." A branch printing office and bindery do the work of the Library of Congress is in that building, and a smaller branch in the State, War and Navy building, are operated under the Government Printing Office. The scales of wages paid are somewhat in advance of those in commercial establishments, and in addition each employee is given, for each year of service, thirty days' leave of absence with pay.

The work of the Government Printing Office which differs from that of any other combined job printing and book and periodical publishing house—except that this is the largest in existence—is that done for Congress in abnormal requirements of speed and varying amounts. This is largely done between 7 or later P.M. and noon of the next day. Considering the intervals of slack and rush according as Congress is sitting or not, the totally incalculable and enormously varying amount of printing for each day's session which must be rushed through for immediate use, together with the confidential printing, a government printing plant seems a necessity. On account of its own exceptional needs, and also because established under Congress in the beginning, that body is slow in relinquishing a share in the management to other departments of the government, although under its control no 10-year period has passed without an expensive investigation of alleged looseness in administration. Printing for non-Congressional branches of the government being now two to three or more times the quantity done for Congress, it would seem that a directorate representing all branches of the government, with the addition of non-governmental expert membership, might be the solution of the problem of government printing administration.

The office of the superintendent of documents, created in 1895, was made a subordinate bureau of the Government Printing Office. Its functions are to act as a clearing-house and storehouse of United States publications; to distribute them by gift to libraries, especially to those designated as depositories, and by sale to individuals; and to make catalogues and lists of them. Its library, in which is preserved one copy of every edition of everything published by the government, contained 30 June 1916 a total of 193,533 pieces. Complete centralization of distribution in this office has, however, not yet been effected. It delivers to

the nearly 500 depository libraries an average of 1,000 publications yearly. It issues a list of new publications each month; an index to the documents and reports of Senate and House each session; and at the end of each Congress a full analytical dictionary catalogue of everything published during the two years.

Appropriations for the Government Printing Office and the public printing and binding for the year ending 30 June 1915 were \$5,907,051.30. Of this sum \$331,395 was for salaries and expenses of the office of the Superintendent of Documents. There came under the trimming machine 64,151,813 books and pamphlets. Case-bound books totaled 1,744,335. Money order books were shipped to the number of 677,542. Of postal cards there were produced 1,038,063, 199.

Consult reports of the Government Printing Office, 1853-date, which include, 1895-date, the reports of the superintendent of documents. For divisions of the office, personnel and salaries, consult the United States Census Bureau, Official Register, latest issue. Reports on operations of the main building were made, 1899-1904, by the officer of the Engineer Department in charge. (Consult entries in document catalogues, issued by the superintendent of documents, for those years. Also brief notices in annual reports of Engineer Department). For description of office consult *Pan-American Union Monthly Bulletin*, November 1910, pp. 737-755; many illustrations; Whelpley, 'The Nation's Print Shop and Its Methods,' *Review of Reviews*, 28:556-563, 1903; Rossiter, 'Problem of the Federal Printing,' *Atlantic*, 96:331-344, 1905. For administration consult United States Printing Investigation Commission, Report, 1906.

## GOVERNMENT OF THE UNITED STATES. See UNITED STATES.

### GOVERNMENTAL POLICIES, Executive Influence Upon. See EXECUTIVE.

**GOVERNOR**, in the States, Territories and acquired possessions of the United States. Before the attainment of independence by the English colonies in regions that now form part of the United States, the term "governor" denoted the chief executive of each colony, either appointed by the Crown, or by the proprietor or—as in the case of Connecticut and Rhode Island, and of Massachusetts till it lost its charter in 1684—chosen by the freemen of the colony (compare an article by the late John D. Long, Governor of Massachusetts 1890-81, in 'Cyclopedia of American Government,' Vol. II, p. 91, New York and London 1914). In each State the governor is now a constitutional official, elected by the qualified voters; his functions and powers are determined by the State constitution. In some States there is elected on the same ballot a lieutenant-governor. Associated with the governor in a few of the older States there is an advisory executive council, each member of which is elected by popular vote from a "councillor district." In Massachusetts their approval of appointments is required, and the governor's responsibilities are shared with them in other ways. "The pardoning power is lodged in the governor's hands. In a few New England States he cannot exercise it except with the concurrence of the executive council, but in most States, as in the

Federal government, it is vested solely in the chief executive." A tendency is noted to restrict the governor's executive power by assigning to commissions, the appointment of which rests with him, supervision and control of such departments of the public service as railroads, water-supply, lighting, etc. "He is still commander-in-chief of the military forces of the State, and has the appointment of his military staff, but usually the other officers of the militia are now elected by vote from within the various military lines." In a few States the governor still appoints the judges. His participation in the labors of the legislative branch is to a certain extent direct. Thus, he can call the legislature together for extraordinary sessions; he possesses (save in North Carolina) the power of vetoing enactments, with the exception of constitutional amendments. But not less important—in time of crisis, indeed, even more important—is the governor's influence in shaping legislation "altogether beyond the limitations of his strict constitutional range" by the legitimate exercise of powers inherent in leadership, expressing and enforcing by his utterances the views, the demands and the judgment of his State.

The official standing of governors of the Territories or acquired possessions of the United States is sharply contrasted with that of governors of States. The former receive appointment from the President of the United States and are removable at his pleasure. Moreover, adaptation to varying conditions and circumstances is often required. For example, in the naval government of the island of Guam (a naval station) the governor combines executive with legislative powers. See EXECUTIVE.

**GOVERNOR**, a device which regulates the admission of steam to a steam-engine, according to the rate of motion. The intention is to maintain uniform velocity, and any acceleration of speed above a given rate causes a valve to be partially closed, diminishing the area of steam passage. The favorite form of governor has a pair of balls suspended from a vertical shaft, so as to swing outward when the shaft is rotated. The greater the speed the greater the centrifugal force, and consequently the farther the balls depart from the axis of rotation; the inclination of the ball arms is made effective in working the valve. See STEAM-ENGINE.

**GOVERNORS, Terms of Office, Age Limit, etc.** See ELECTORAL QUALIFICATIONS.

**GOVERNORS' CONFERENCE.** The factors that brought about the establishment of the governors' conference in the United States were the three following: (1) the growing centralization of power at Washington; (2) the shifting, uncertain status of State's rights, and (3) the lack of uniform laws. It was felt by many that the nation was confronted by a grave crisis. Vital problems affecting the general welfare of all the people remained unsolved, though they had reached the acute state where solution was imperatively demanded. In 1908 a meeting of governors was held at the White House, Washington. It was called by President Roosevelt, and the principal subject considered at that time was the conservation of natural resources. Early in the following year a second meeting, also at Washington, was held to consider topics coming under State,

and constitutionally not under Federal, administration and jurisdiction—such as the questions relating to marriage and divorce, child labor, capital punishment, initiative, referendum and recall, etc. In 1910 a third conference was held at Frankfort, Ky. In 1911, at Spring Lake, N. J., the governors' conference debated with special interest the general subject of intrastate commerce; and the doctrine of State sovereignty, involving control by the several States in such matters, was maintained in protest against the decision of Justice Sanborn, of the Court of Appeals of the United States, in the Minnesota Railway Commission injunction case. A meeting of Western governors was held in 1912; and in the same year conferences were held at Richmond, Va., and Washington, D. C.; followed by a session at Colorado Springs in 1913. The conference at Boston, 24-27 Aug. 1915, merits special attention, although the attendance was not large and it is quite true that, as has been said, "the high hopes that were aroused at the time of the first conference of governors have unfortunately not been fully realized." One of the subjects—the most vital of all—discussed at the Boston meeting indicates lines of activity along which genuine progress can be made and the public interest faithfully served by the States' chief executives (see article GOVERNOR). That subject was "The Relation of the State to the National Defense." Finally, the functions of the governors' conference are officially declared to be: "Exchange of views and experiences on subjects of general importance to the people of the several States, the promotion of greater uniformity in State legislation, and the attainment of greater efficiency in State administration."

**GOVERNOR'S ISLAND.** N. Y., small fortified island in New York Bay, south of the Battery, and at the entrance to East River. It is separated from Brooklyn by Buttermilk Channel. In 1621, under the name of Nutten Island, it was a station of the West India Company. Later it was used as a residence by the colonial governors of New York, hence its present name. Wouter Van Twiller was the first governor (1637) to use the island for a country residence. In 1708 it was in use as a quarantine station, and in 1784 Gov. George Clinton leased the island to a company who used it for a summer resort and a racetrack. Lord Cornbury in 1702 and Governor Hardy in 1756 urged the erection of batteries on the island; but no definite action was taken until 1794, when there were rumors of a war with France, the State of New York appropriated \$250,000 for the erection of a fort and earthworks. The general government appropriated \$31,117, and the money was expended for the construction of Fort Jay in the centre of the island. Other sums were used later in improving the fort, but in 1801 the work ceased until 1806-07, when from "an enclosed work of earth and wood" the fort was improved and faced with permanent masonry at a cost of \$30,000, and was named Fort Columbus, as at present. The designs for Fort Columbus, also Castle Williams, were made by Jonathan Williams, Lafayette's chief engineer of the army. The plans called for 104 guns for Fort Columbus and 100 guns for Castle Williams. The

latter fort exists to this day practically as it was when completed in 1811. Its area is three-fifths of a circle which is 200 feet in diameter, and the walls are 40 feet high. In 1861-65 Castle Williams was used as a prison for Confederates; at one time there were as many as 1,000 prisoners. After the War of 1812 a fortification called South Battery was built at a place to command Buttermilk Channel. Governor's Island is the army headquarters of the Department of the East, a most important military post, embracing the coast from Maine to Florida and including Porto Rico. It has less the look of war than many smaller forts, but it has a garrison usually of three companies, and it is used as a military prison, nearly all the prisoners being deserters. A little church, under the care of Trinity parish, Manhattan, residences for the officers and some storage places are the only buildings in addition to the forts. At the beginning of the 17th century the island was 1,500 feet long and 900 feet wide with an elevation above high-water of 20 feet. Its whole area then was 100 acres. The tide-waters have washed away a large portion of the island. The War Department began in 1903 the work of reclaiming from the sea the land washed away and the island is now restored to about its former area. The need of modern forts and better defensive equipment on Governor's Island no longer exists since an excellent system of fortifications has been established at the entrance to The Narrows and along the shores of Long Island Sound.

**GOVERNOR'S ISLAND, Mass.,** fortified island belonging to Suffolk County, in Boston Harbor. It is just north of the main ship-channel and of Castle Island. The fortifications form part of the system of defense of Boston Harbor. Fort Winthrop, the keep or redoubt, is an enclosed quadrangular fort with open barbette batteries.

**GOWER, John,** English poet: b. probably about 1325; d. London, October 1408. But little is known of his life save that he was rich and well educated, did not marry till late in life and became blind about 1400. His tomb is still to be seen in Saint Saviour's, Southwark. He was a personal friend of Chaucer, who, in dedicating to him his 'Troilus and Cressida,' addresses him as the 'moral Gower'—an epithet that has indissolubly linked itself with his name. Gower wrote three large works in as many languages; the 'Speculum Meditantis,' in French verse, long supposed to be lost, but discovered by G. C. Macaulay and published in his edition of the poet's works. The 'Vox Clamantis,' a tedious poem in Latin elegiac verse, written 1382-84, describing the rising of the mob under Wat Tyler; and the long poem entitled 'Confessio Amantis,' written 'in our English . . . for England's sake,' the date uncertain, but at least the poem was in existence in 1392-93. 'Confessio Amantis' consists of a prologue and eight books, written in verses of eight syllables, rhyming in pairs. The long prologue gives a sombre account of the state of the world at that time, and the poem opens by introducing the author himself in the character of an unhappy lover. It ends with the lover's petition in a strophic poem addressed to Venus, her judgment, and finally the lover's cure and absolution. With-

out originality—in J. Russell Lowell's phrase he "raised tediousness to the precision of a science"—narrative power, pathos or humor, Gower yet commands respect for the laborious equality of his verse, and his work remains a splendid monument of English. Consult Pauli's edition (1857); Henry Morley's serviceable reprint in the 'Carisbrook Library' (1889); his 'Complete Works,' edited by G. C. Macaulay (3 vols., New York 1899-1900); and Dodd, W. G., 'Courtly Love in Chaucer and Gower' (New York 1913).

**GOWER, LORD Ronald Sutherland-**, English author and sculptor: b. 1845; d. 9 March 1916. He was the second son of the second Duke of Sutherland. Educated at Trinity College, Cambridge, he sat in Parliament for Sutherlandshire, and also became known as the sculptor of such works as 'The Old Guard at Waterloo,' and the Shakespeare monument at Stratford-on-Avon. Among his writings are 'My Reminiscences' (1883), a work of much interest; 'The Tower of London' (1901); 'Old Diaries'; 'Records and Reminiscences' (1903).

**GOWRIE** (gow'ri) **CONSPIRACY,** an unexplained episode in Scottish history. On 5 Aug. 1600, James VI, afterward James I, of England, came to Gowrie House, the residence of the Earl of Gowrie, in the suburbs of Perth, having been lured thither, according to one account, by the report of a suspicious person there held in custody. After dining, the king was led aside by Alexander Ruthven, younger brother of the earl, and the king's attendants were told that his majesty had left the castle. An attempt was made by Ruthven, either to murder or to bind the king, who struggled desperately and shouted for help. His retinue coming to his rescue slew Ruthven and Gowrie. The motives of the two brothers have been variously explained. The current belief is that they intended to capture the king and either give him up to England or administer the government in his name in the interest of that country and in that of the Scotch Presbyterian leaders. Others supposed that their object was merely to avenge the death of their father, who had been executed a few years previously. The heavy indebtedness of the king to Gowrie was another cause of irritation. Gowrie House was destroyed and the estates confiscated.

**GOYA Y LUCIENTES,** gō'ya ē loo-thē-ān'tās, **Francisco José** de, Spanish artist, caricaturist, etcher and designer: b. Fuendetodos, Aragon, 30 March 1746; d. Bordeaux, France, 16 April 1828. Goya's name ranks with those of Velasquez and Murillo in the history of Spanish art. Of peasant birth, he led an early roving and somewhat dissipated life, his brilliant talents as an artist and a musician with the gift of song making him a favorite both with the wealthy and poorer classes. With the latter he was obviously more in sympathy, and from their daily life drew the picturesque subjects and motives which he turned out in a profusion of sketches, paintings, water colors, portraits, genre pictures, caricatures, designs and etchings. He was equally gifted in all lines of his art and his works in the satirical grotesque are described by Théophile Gautier as "a mixture of Rembrandt, Watteau and the comical dreams of

Rabelais,<sup>9</sup> while Champfleury compares him to Daumier, the greatest of modern French caricaturists. His early training in art began under Martínez at Saragossa, near his native village, and afterward at Madrid under Bayeu, whose daughter he subsequently married. To broaden his experience, he joined a traveling troupe of toredors so as to reach Rome, where he spent a profitable period in the examination of the great art collections and in mingling with the everyday life of the people. In 1772, signing his sketch 'Pupil of Bayeu, painter to the King of Spain,' he received second prize in a competition from the Academy of Parma. On his return to Spain he began his professional career by painting from 1772-74 the 'Adoration of God,' ceiling frescoes of the church of Santa Maria at Saragossa, and the frescoes of the 'Life of the Virgin' at the Carthusian Convent, Cartuja Aula Dei, six miles north of Saragossa. From 1775-91 he designed cartoons of contemporary Spanish life for the royal manufactory of tapestries at Santa Barbara, Madrid; in 1808, long after his death, 43 of these were discovered in a cellar of the royal palace. In 1788 he was elected honorary member of the Academy of San Fernando, and was appointed painter of the chamber to King Charles IV, in 1798 becoming chief royal painter. In 1793 he had replaced Calleja as lieutenant director of the Academy of San Fernando. Spain's political unrest interfered with his career from 1808 until 1813, and later he was compelled to leave Spain. He visited Paris in 1822, returned for a short period to Madrid in 1827, but spent the few last years of his life at Bordeaux where a monument marks his grave. His greatest work is the series of cupola frescoes portraying the life of Saint Anthony, completed in 1798 for the church of San Antonio de la Florida, near Manzanara. He excelled in portraiture and notable are the paintings of Charles III; equestrian portraits of Charles IV and Queen Maria Louisa; a family group of Charles IV; a family group of the Duke of Ossuna; a portrait of himself in the Academy of San Fernando, where also is his famous double portrait of 'La Maya,' a lovely young female, slightly draped, and nude. In the museum of the Hispanic Society in New York is the portrait of his innamorata, the beautiful Duchess of Alva, also a portrait of General Forastera and several drawings. His 'Jewess of Tangier' and his portrait of Don Sebastian Martinez are in the Metropolitan Museum of New York city. His work is more popularly known through his numerous etchings, descriptive and satirical, widely reproduced, especially the bull-fighting series, insurrection street fights, folk picture, genre subjects and by his later essays in lithography of which the 'Bulls of Bordeaux' is a well-known example. 'Los Proverbios' (Proverbs) and 'Los Caprichos' (Caprices), virile, weird, grotesque caricatures of established society and religion, with hidden meanings known only to the initiated, are his chief etchings. Consult Hofmann, 'Catalogue of Goya Etchings' (Vienna 1907); Hunter, 'Tapestries' (New York 1912); Vilaamil, 'Los tapices de Goya' (Madrid 1870); also biographies by Brunet (Paris 1865); Calvert (London 1908); Hind, 'Great Engravers' (London 1911); Muther (London 1905); Stokes (New

York 1914); Von Loga (Berlin 1903); Yriarte (Paris 1867); Zapater (Saragossa 1868).

**GOYANA**, gô-yân'ná, Brazil, city in the state of Pernambuco, on the Goyana River, about 20 miles from the Atlantic. It is a shipping port for sugar, alcohol, dyewoods, cabinet woods and cotton. Pop. 30,000.

**GOYAU**, gô'yô', Pierre Louis Théophile Georges, French editor and author: b. Orléans, France, 31 May 1869. He was educated at the Orléans Lycée, the Lycée Louis le Grand and the Higher Normal School, Paris, and the French School at Rome. Since 1895 he has been associate editor of the *Revue des Deux Mondes*. He married the daughter of President Félix Faure. In 1898 he was awarded the Prix Bordin and in 1908 the Prix Vitet by the French Academy. He is a Fellow of the University of Paris and has published 'Le Pape, les catholiques et la question sociale' (1893); 'Autour du catholicisme social' (5 vols., 1896-1912); 'L'Allemagne religieuse, le protestantisme' (1898; German trans.); 'L'école d'aujourd'hui' (2 vols., 1899; 1906); 'Le francmaçonnerie en France' (1899); 'L'endemain d'unité: Rome, royaume de Naples' (1900); 'L'idée de patrie et l'humanitarisme, essai d'histoire française' (1902); 'Les nations apôtres, vieille France, jeune Allemagne' (1903); 'L'Allemagne religieuse, le catholicisme, 1800-1870' (4 vols., 1905-09); 'Mochler' (1906); 'Jeanne d'Arc devant l'opinion allemande' (1907); 'Ketteler' (1907; translations in Spanish and Italian); 'Sainte Mélanie' (1907); 'Autour du catholicisme social' (4th and 5th series, 1910; 1912); 'Bismarck et l'Eglise: le kulturkampf' (4 vols., 1896-1912); 'Le Vatican,' with Perate and Fabre (1895; German trans.). He contributed several articles to the Catholic Encyclopedia.

**GOYAZ**, gô-yáz', Brazil, state completely enclosed between the states of Maranhão, Piauh, Bahia, Minas Geraes, São Paulo, Mato Grosso and Pará. Its area is estimated at 747,311 square kilometers, or, say, 288,536 square miles; but, as a large part of the Araguaia-Tocantins Basin is unexplored, a precise statement in regard to the extent of its territory cannot be justified. The Goyaz plateau with the Pyreneus Mountain range constitute the watershed which divides the basin of the Tocantins and Araguaia rivers from the São Francisco and Paraná basins; the headwaters of the Araguaia and the Paraguay are near one another; and thus the point of divergence of great river-systems is found within this state. The climate of the plateau is excellent; among the mountain extremes of heat and cold are felt; and large districts are well adapted to agriculture. Forests extend along the river-courses, while the elevated lands of the interior have only occasional clusters of trees. The chief products are tobacco, rubber and cattle; the gold and diamond washings which at one time were supposed to be important now yield very little. The capital, Goyaz, formerly called Villa Boa, has about 25,000 inhabitants. The population of the state was given as 340,000 in 1911; of that number nearly 25,000 were Indians or Mestizos. The special interest attached to this state is due to a circumstance which is mentioned in a geographical sketch of Brazil (Washington

1901; compiled by the Bureau of the American Republics), in the following terms: "This state enjoys a splendid climate, and has been selected for the site of the future capital of the republic, the constitution providing for its location on the plateau of Goyaz. A special commission, at the head of which is the director of the observatory of Rio de Janeiro, has already marked the site for the new capital, which is a space 14,400 kilometers square (about 5,500 square miles) on the Upper Tocantins, in the Pyreneus range of mountains. It has an elevation of from 200 to 300 metres above the level of the plateau and is drained by numerous streams of pure water, being the centre of the three hydrographic systems of Brazil. . . . It is here, near the point of divergence of her three great rivers, that Brazil wishes to establish the national capital." But the site thus selected has no natural means of communication with the Brazilian coast. The Tocantins-Araguaya is navigable for only about one-tenth of its entire length; its course is broken by falls and rapids, and as it approaches the Gulf of the Amazon it becomes very shallow. Canals and railways would be required in order to make the rivers commercial highways; moreover, the state is without seaboard—is, indeed, far inland. The isolation of the proposed capital suggests that of Bogotá.

MARRION WILCOX,

*Editor Encyclopedia of Latin America.*

**GÓZAN**, Mesopotamia, a district or province called Guzanu in the Assyrian inscriptions, and known as Gauzanitis by Ptolemy. It was situated on both banks of the Khabur River, occupying the upper part of the country which was later the kingdom of Osroene. Its history seems to have been a stormy one. It became part of the Assyrian Empire in the 9th century B.C., revolting against Adadnirari V. in the 7th century. In the following century it revolted again, but was put down by Asurdan III. Gozan was also the name of a city in the same district, generally supposed to have been the capital of the province of Gozan.

**GOZZI**, Carlo, Italian dramatist, younger brother of the brilliant essayist Gaspare Gozzi: b. Venice, 13 Dec. 1720; d. 4 Apr. 1806. On account of his father's financial embarrassments Gozzi spent three years in Dalmatia, seeking a career as a soldier of fortune (1741-1744). On his return to Venice he tried unsuccessfully to bring order into the chaotic family affairs. His natural bent for literature led him to join the Academy of the Granelleschi and to take part in the quarrels that divided the Venetians into the rival literary camps of the partisans of the dramatists Goldoni and Chiari. He attacked both these writers with equal vigor, the former for his fondness for the newer philosophy and for his leaning toward foreign influences in the theatre, the latter for his bombast and ignorance, in 'La Tartana degli Influssi per l'anno bisestile 1756', a sort of comic almanack, and in a satirical poem, 'La Marfisa bizzarra'. In order to prove to Goldoni that any novelty, even the most silly, could attract people to the theatre, and that he could succeed with any fairy tale whatever, he wrote the 'Amore delle tre melarance' (The Three Oranges), drawn from Basile's 'Cunto delli

Cunti', a 17th Century collection of popular stories. Produced in January, 1761 by Sacchi's troupe of comedians, bringing back on the boards the stock characters of the earlier Italian comedy of masks, and satirizing the two rivals Chiari and Goldoni, the one under the guise of a fairy and the other as a magician, Gozzi's fantastic play won him a magnificent triumph. Between 1761 and 1765 a rapid succession of *fiabe* dramatized from Neapolitan and Oriental fairy tales appeared on the stage, 'Il Corvo' (The Raven), 'Il Re Cervo' (King Stag), 'La Turandot', 'Zobeide', 'Aucellin Belverde' (The little green bird), 'Zeim re dei Geni' (Zeim, King of the Genii), etc. In many cases only an outline of the scene is given; in other scenes the entire action is worked out in prose or in verse. In his later plays Gozzi wrote dramas imitated in the main from the Spanish of Calderon, Tirso de Molina, Rojas and Moreto. His 'Memorie inutili della sua vita' (1797) contains very interesting memoirs. Gozzi's fame rests on his *fiabe*, of which 'Il Corvo' is the best. Written in the Venetian dialect, they are a capricious mixture of reality and fantasy, of popular forms and *commedia dell'arte*, of allegory and satire, of supernatural beings and stock stage characters. More esteemed abroad than in Italy, Gozzi's reputation spread quickly in France and Germany. Goethe, Tieck, Schlegel praised his work, Schiller adapted his 'Turandot'; Mme. de Stael, Sismondi and Musset admired his bold fancies and his whimsicalities. Consult Magrini, G. B., 'I tempi, la vita e gli scritti di Carlo Gozzi' (Benevento 1883); Masi, E., 'Le Fiabe' (Bologna 1885); Symonds, J. A., 'The Memoirs, . . . Gozzi's life, the dramatic fables' (London 1890).

ALFRED G. PANARONI.

**GRABEN** (German, grave), a term applied to a block of the earth's crust which has dropped between two adjacent faults; also used to describe a valley or lowland on the site of such a block. The Rhine Valley between the Black Forest and the Vosges, and the Jordan Valley and Dead Sea depression in Palestine afford well-known examples. See **FAULT**; **HORST**.

**GRACCHUS**, grāk'ūs, Tiberius Sempronius and Gaius Sempronius, two Roman statesmen: b. about 163 B.C. and 159 B.C.; d. 133 B.C. and 121 B.C. In their attempts to obtain reforms favorable to the commons, they awakened popular commotions of which they themselves became the victims. Tiberius served under the command of his brother-in-law, the younger Scipio, at the siege of Carthage, and was the first man to mount the walls. He was subsequently quaestor to the army of the consul Mancinus, who at that time waged war against the Numantines in Spain. After the defeat of Mancinus, he concluded a treaty with the Numantines, which, without being disgraceful to the Romans, secured to the Numantines their independence. This treaty, however, was opposed by the aristocratic party and repudiated by the Senate. Tiberius, nevertheless, upheld by the populace, in 133 B.C. was elected tribune of the plebs, and sought to reform the condition of the poorer citizens who were without land, and since the great estates of the wealthy were cultivated by slaves, also

largely, without employment. He endeavored to attain his object by the revival of the Licinian Rogations. It had been decreed, on the proposition of the tribune, Licinius Stolo, "that no one should possess more than 500 acres (*jugera*, each 28,000 square feet) of the public domain (*ager publicus*), and that the overplus should be equally divided among the plebeians." This law, which was now called the Gracchan, the Sempronian, or by way of eminence the Agrarian Law, he revived, but with the introduction of several softening clauses. The proposition of Tiberius Gracchus was met with the most determined opposition by the ruling party. To counteract his plans the Senate gained over one of the tribunes, Marcus Octavius; and when Tiberius, after having, according to custom, exposed his law 19 days to the public view, proceeded to take the votes of the assembled people upon it, Octavius interposed with his veto, and thus seemed at once to have defeated the whole undertaking. Tiberius now exerted all the prerogatives of his office, sealed up the treasury and forbade all the authorities the discharge of their several offices. He saw, however, that this was of no service to his plan. He therefore took a step till then unheard of in Roman history. At the next assembly of the people he obtained the expulsion of Octavius from office, as faithless to the cause of the people. The bill was thus passed, and a committee consisting of Tiberius himself, his brother Gaius and his father-in-law, Appius Claudius, appointed to carry out its various provisions. All the difficulties which stood in the way of the law now appeared in their full light. Even the preparatory business of ascertaining which was the public land, and which private property, was found to have its full share. Outcries and complaints were made from every part of Italy. When June of the following year came on, in which the tribunes for the next year were to be elected, Tiberius, who had endeavored to regain the favor of the people by some new propositions, offered himself again as a candidate for the office. The aristocrats used every effort to prevent his election, and the ferment in Rome was carried to the highest pitch. One election day went by without any election being made. On the next a vast multitude beset the forum, and the Senate assembled in the neighboring temple of Faith (*Fides*). Tiberius strove in vain to speak, and was killed in the tumult which followed. The place of the murdered Tiberius was filled by Licinius Crassus, father-in-law of Gaius Gracchus; and on his death Carbo, Fulvius Flaccus and Gaius Gracchus constituted the committee appointed for the enforcement of the law.

In this way the parties had struggled with varying success, when, in 123 B.C., the younger Gracchus, who, as *quaestor*, had been with the army in Sardinia, obtained the tribuneship. With more varied and shining talents than his brother, he united a stormy eloquence, which carried away his hearers. In the discharge of his office as tribune he first of all renewed his brother's law, which had meanwhile fallen into disuse, and revenged his memory by expelling many of his most violent enemies from the city. At the same time he carried through a law "that every month corn

should be sold to the poor at a low fixed rate," and by another law effected some alleviations in the rigor of the military service, and ensured for the soldiers clothing, besides their pay. The people were animated with an unlimited enthusiasm for their favorite; his enemies were terrified and weakened; hence he obtained the renewal of his office for the following year with ease. His attempt to introduce 300 knights into the Senate failed; but on the other hand, at his proposal the administration of justice was taken from the Senate and transferred to the equestrian order. This gave rise to a new political power in the Roman commonwealth, which, holding a station intermediate between the Senate and the people, had a most powerful influence in its subsequent history. The Senate now resorted to a new but sure means of destroying Gaius. Livius Drusus, a tribune gained over to their interests, had the art to withdraw the affections of the populace from Gaius by making greater promises to them, and thus obtained a superior popularity for himself and the Senate. Hence it resulted that Gaius did not obtain a third tribuneship, and Opimius, one of his bitterest enemies, was chosen to the consulate. In the ensuing civil disturbances Gaius was slain by his slave, at his command. Consult Beesly, 'The Gracchi: Marius and Sulla' (London 1878); Mommsen, 'History of Rome,' Vol. IV (New York 1903-05); Oman, 'Seven Roman Statesmen of the Later Republic' (London 1902); Underhill, 'Plutarch's Lives of the Gracchi' (London 1892).

**GRACE, William Russell**, American merchant: b. Queenstown, Cork, Ireland, 10 May 1832; d. New York, 21 March 1904. In 1846 he worked his way on a sailing vessel to New York; in 1850 went to Callao, Peru, where he became a clerk in the shipping office of Bryce & Company, and later partner in the firm, which eventually assumed the style of Grace Brothers & Company. He organized the firm of W. R. Grace & Company, now the leading American house in the South and Central American trade, with main offices at New York, and branches at London, San Francisco, Lima, Callao, Valparaiso, Santiago and Concepcion. In 1891 he also established the New York and Pacific Steamship Company. He was Democratic mayor of New York in 1881-82 and 1885-86. His philanthropies were numerous, including the gift of one-fourth the cargo of the United States steamer *Constellation*, dispatched to the aid of the Irish famine sufferers of 1880; and large sums for the building and maintenance of the Grace Institute, established by him in 1897 at New York for the instruction of women in domestic arts and sciences, trades and occupations. He became a member of the American Museum of Natural History and the American Geographical Society, and organized and was elected president of the Nicaraguan canal syndicate, an organization of capital for securing to the United States control of the waterway.

**GRACE OF GOD**, an expression borrowed from Saint Paul's writings. The apostle frequently employs the term *grace* in the sense of a gift which enables those who have it to do what they could not do without it. In common parlance we use such expressions as the "gift of

music," the "gift of poetry," as belonging to one who might acquire many accomplishments, but could never acquire what is meant by a gift for anything. Saint Paul, speaking of his own conversion, his calling to the apostolate and his many labors, says: "By the grace of God I am what I am." Again he addresses his followers in these words: "By grace are ye saved; not of yourselves, it is the gift of God."

The Church of England and the Protestant Episcopal Church in the United States teach that grace is the assistance given by God to those who believe in Him, so that they may please Him and keep His commandments. All the Reformed churches agree on this point and they also agree that no man can do good works "as God hath willed and commanded them to be done" (39 Articles), that is, from a right motive and in a religious spirit of devotion, without the grace of God. They also teach that the principal means of grace is prayer, and study of the Scriptures, which latter make a man "thoroughly furnished unto all good works" (1 Tim. iii, 17). To these means of grace the Catechism in the Book of Common Prayer adds the two sacraments, of Baptism and of the Lord's Supper, which are not only means of grace, but also "outward and visible signs" and "pledges" of the grace received by those who participate in them. As defined by the eminent Roman Catholic theologian, Perrone, grace is "that gratuitous inward aid (*auxilium*) which God affords to fallen man through Christ's merits, to enable him to perform supernatural acts, so that he may attain justification and persevere therein" (Prælect. Theol., c. d. Gratia). The Roman Catholic Church's doctrine of grace is opposed on one side to the teachings of Pelagians, who denied the necessity of grace, and on the other to the teachings of those who held that without grace every act of man is a sin, and specifically that "the constancy of Socrates, the continence of Xenocrates . . . must be regarded, not as virtues but as vices" (Melanc. Loc. Theol.); and that "from man's corrupt nature proceeds naught that is not worthy of condemnation" (damnable: Inst. i, 2). Roman Catholic doctrine holds the middle ground between these extremes. As against the Pelagians the Roman Catholic Church teaches that for all acts conducive to salvation (*salutares*) the inner grace of the Holy Spirit is necessary (Conc. Trid. Sess. VI, can. ii, 3). As against Melancthon, Baius and the Jansenists, the same Church teaches that fallen man, before he receives the gift or grace of faith, can perform acts that are morally good. Further, the Roman Catholic Church, in opposition to the teaching of Calvin, holds that a man once justified may fall from that state. Again, the Roman Catholic Church teaches that in all his acts conducive to salvation (*salutaribus*) man is free; in other words, grace imposes on man no necessity.

The Council of Trent in Can. iv of Sess. VI, thus defines the Roman Catholic doctrine of the freedom of man's will while co-operating with grace: "If one shall say that man's free will, moved and stirred by God, co-operates not, by giving assent to God so inciting and calling, toward disposing and fitting himself for grace of justification; or that he cannot, if he wishes, dissent; but that like some lifeless thing he cannot do anything at all and is wholly passive; be he anathema." The Roman

Catholic Church further teaches that the state of grace and holiness in which man was constituted in Paradise was supernatural, something added to the perfection of his human nature; in contradiction to those who teach that this state was in the same sense natural to him as any of his mental or bodily faculties. In consistency with this view such teachers hold that in his fall Adam lost all power and faculty for doing any good act, and that whatever he did was sin. All these views seem to have been influenced by the pre-pagan conception of the graces who bestowed upon man the favors of the gods, without which one could show no special gifts, such as oratory, music and poetry. Thus man, in so far as the graces were concerned, was fated. Christian theologians, among them Saint Paul, thinking in the terms of their day and looking upon religion as a special gift, were naturally guided by Roman philosophy in describing it. Thus the terms *forcoordination* and *predestination* seem to have formed a part of the conception of certain religious sections of Christianity from very early days.

**GRACES** (Greek, *Charites*, translated by the Romans *Gratiae*), the goddesses of grace, from whom, according to Pindar, comes everything beautiful and agreeable, through whom alone man becomes wise and glorious. They were the goddesses of heavenly light and seem to have been connected with bloom and fertility, which would account for their being patrons of marriage and might also explain the fact that it was customary to swear by the graces who brought prosperity and probably would refuse to be personally favorable to one who swore falsely in their name. According to Hesiod, and most poets and mythologists, Zeus was their father, and Eurynome their mother. Hesiod gives them the names of *Aglaia* (brilliance), *Thalia* (the blooming), and *Euphrosyne* (mirth). Homer mentions them in the 'Iliad' as handmaids of Hera (Juno), but in the 'Odyssey' as those of Aphrodite. He conceived them as forming a numerous troop of attendant goddesses, whose office it was to render happy the days of the immortals. Later poets considered them as allegorical images. They not only improve corporeal charms, they have an influence also upon music, eloquence, poetry and other arts; and the execution of acts of benevolence and gratitude is likewise superintended by them. Saint Paul uses the word grace in the old sense of the term, when he speaks of "the grace of God," that is the gift of God. He had in his mind the meaning current in his day when the graces were still believed to be the bestowers of special gifts which we now designate as talents. In the earliest times the statues of the Graces represented clothed forms; at a later period they were represented as nude. They had many temples in Greece, partly dedicated to them alone, partly in common with other deities, particularly Aphrodite, the Muses, Eros, Hermes and Apollo. Their festivals were called, in Greece, *Charisia*; and libations of wine were offered them at meals. The most celebrated Graces of modern sculpture are those of Canova and Thorwaldsen.

**GRADATION**, that process of dynamical geology by which the external forces of wind,

frost, running water, waves and glaciers tend to tear down the earth's surface at one place and build it up at another. The tearing-down process is degradation, erosion or denudation; the building-up process is aggradation or deposition. See **EROSION** and **GEOLOGY**, particularly section on *Dynamical Geology*.

**GRADE CROSSINGS, Elimination of.**—Separation of the grade of a railroad devoted to engine and car traffic from the grade of a street or highway for pedestrian and vehicular traffic has long been a public problem. After 1908, when in that year 832 persons were killed and 1,755 injured at grade crossings, the problem received increased attention. Besides accidents and the vexatious interference with street traffic, the aggregate amount of time lost at grade crossings by pedestrians, vehicles, automobiles and street cars was enormous. Elimination of grade crossings is effected by: (1) elevation or depression of the street with no change in the grade of the railroad; (2) partial elevation or depression of the railroad combined with the partial depression or elevation of the street; (3) complete elevation or depression of the railroad with a minimum change in the grade of the street. While ensuring a perfect roadbed for railroad operation, with a minimum of interference with the streets, the cost of warning signs, bells and signals, the maintenance of gates and the employment of flagmen is also eliminated, and the railroad is relieved of a large expense due to personal injury claims. The chief advantage to the railroad is increased speed and freedom of operation. By a law passed in 1889 in Connecticut, each road is practically required to eliminate at its own expense one grade crossing each year, for every 60 miles of road owned or operated. In Chicago where extensive grade separation operations were necessary, the railroad was required to bear the entire cost of track elevation including the cost of bridges and the reconstruction of the streets; the city paid only the property damages, which in most cases were small. In Massachusetts, the railroad pays 65 per cent of the cost, the city not more than 10 per cent, the street railway company using the crossing, not exceeding 15 per cent, and the State the remainder. Unless a street railway is involved, the State's proportion is 25 per cent. State aid laws also exist in Vermont and New York. Consult Bassett, E. M., 'Grade Crossings' (in *New York Public Service Commission, Third Annual Report 1909*); Whitten, R. H., 'Methods of Railway and Street Grade Separation in Cities' (in *Engineering and Contracting Vol. XXXVI*, pp. 442-445, 1911).

**GRADIENTIA**, grā-dī-ēn'shā. See **URODELIA**.

**GRADUAL** (Lat. *Graduale*), in the liturgy of the Roman Catholic Church, an antiphon which is sung by the choir or recited by the celebrant of the Mass, immediately after the intoning or the reading of the Epistle (first lesson). The gradual nearly always consists of two or three verses from the Psalms, suggestive of thoughts pertinent to the office of the day. Thus the gradual for the festival of Holy Innocents (28 December) is from the 123d

Psalms (in the English Bible 124th): "Our soul is escaped even as a bird out of the snare of the fowler; the snare is broken and we are delivered; our help standeth in the name of the Lord who made heaven and earth." *Graduale* or *Liber Gradualis* is also the name of a service book of the Latin Church's liturgy: it takes its name from the gradual as just explained, and contains all the graduals for the Sundays and festivals of the entire year, for the use of the choir.

**GRADUATION ACT**, of 4 Aug. 1854, "An Act to Gradually Reduce the Price of the Public Lands to Actual Settlers." All public lands which had been in the market for 10 years and upward prior to the passage of the act were to be sold for \$1 per acre; all 15 years, 75 cents; all 20 years, 50 cents; all 25 years, 25 cents; all 30 years, 12½ cents—except United States reservations, grants to States for railroad purposes or mineral lands held at over \$1.25 per acre. No one was to have over 320 acres, including lands previously taken up.

**GRADY, Henry Woodfin**, American journalist and orator: b. Athens, Ga., 24 May 1850; d. Atlanta, Ga., 23 Dec. 1889. He was graduated from the University of Georgia in 1868, studied at the University of Virginia in 1868-70, began his journalistic career with contributions to the *Atlanta Constitution*, and for that journal in 1870 described a press tour of Georgia and the resources and possibilities of the State. At Rome, Ga., he edited the *Courier*, and later established and edited the unsuccessful *Daily Commercial*. In 1871 he became Georgia correspondent of the *New York Herald*, and in the same year purchased an interest in the *Herald of Atlanta*, publication of which was suspended in 1876. He then established the *Courier*, which did not long continue, and in 1880 bought a quarter interest in the *Constitution*, of which paper he remained until his death editor and part owner. He was an able journalist, writing for the *New York Herald* some noteworthy letters, including an account of the Hamburg riots in South Carolina; and while editor of the *Constitution*, publishing in its columns vivid descriptions of the Charleston earthquake, and in various magazines articles on the condition and promise of the South. He also became locally known for his oratory, largely through his lecture, 'Just Human,' given at Atlanta. In 1886, at the annual banquet of the New England Society in New York, he made a distinguished address on 'The New South,' which was widely printed and at once gave him a national prominence. Other well-known speeches by him were one on prohibition at Atlanta in 1887, one at the Texas State Fair in Dallas in 1888, and his final and greatest effort, 'The Future of the Negro' (December 1889), before the Merchants' Association of Boston. Grady was the first to present to the North the views of the more enlightened portion of the reconstructed South,—its belief that the "struggle between the States was war and not rebellion," but at the same time its readiness to identify itself with the united progress of the nation. His eloquent services in this behalf were of much importance. He aided in the establishment of the Confederate Veterans' Home, the election of Gen. J. B. Gordon as governor of the State and the organization

of the Atlanta expositions of 1887 and 1889. He declined public office, but was frequently mentioned for nomination to the United States Senate. Consult the 'Life,' by Lee (1896).

**GRAETZ**, grêts, **Heinrich**, historian: b. province of Posen, Germany, 1817; d. 1891. He was largely self-taught. In 1853, on the publication of his history of the Jews which won him immediate fame, he was appointed on the staff of the Breslau Jewish Seminary, where he labored 38 years, and later became professor at the Breslau University, which position he held for 20 years. His history in 12 volumes, completed in 1875, has been translated into many languages, and constitutes his chief work. With a genius for construction out of mere fragments and scattered sources and a style picturesque and trenchant, the history gained him a place among the foremost historians of his age. Its defects are not to be denied—a personal bias at times and a want of poise. As a biblical critic, he secured high rank by his erudition and sagacity, marred at times by a fondness for hypothesis and a too ready acceptance of theory for fact. His critical edition of the Psalms (1882-83) is possibly his most notable exegetical work; he wrote also on the 'Song of Songs' and on 'Koheleth.' A complete bibliography of his writings is given in *Jewish Quarterly Review*, Vol. IV, p. 194. His son **LEO GRAETZ**, born 1856, professor at University of Munich since 1893, is a physicist of note, through his successful methods in heat and electricity and his published works.

**GRAFFITI**, gräf-fé'tê, the name given by archæologists to the rude designs and inscriptions of popular origin drawn or engraved with the style upon the walls of ancient towns and buildings, particularly of Rome and Pompeii. Many of these are valuable for the light they throw on popular habits and modes of thought, and the illustrations they often in consequence afford of ancient authors. Graffiti have been found in Greece and Egypt. Some are traced with chalk or plaster, but the majority are scratched on stone or plaster with the stylus, which helps to account for their preservation. Those in Pompeii are found in the Latin, Greek and Æolian languages, showing that the ancient language of Campania was still extant among a portion of the populace. The inscriptions are most frequently amatory or humorous, sometimes malicious or obscene. In Rome they occur frequently in the catacombs, particularly of Sancta Agnese and San Calisto. Many of these are by Christians, some by Pagans, in ridicule of Christianity. See **GRAPHITTOLOGY**.

**GRAFTAGE**, the process and practice (origin unknown) of propagating plants by the insertion in one of a bud (stock) or twig (scion) of another. It also includes the discussion of all questions relating thereto. The stock may be a complete plant, as in peach budding, or only a part, in which case it may be either a root or a stem part. In some instances (inarching, see below) both plants may have roots. Since the process is dependent upon the coalescence of the cambium (q.v.) of stock and scion the first essential is to make these two surfaces abut; the second is to check evaporation from the cut surfaces.

The many scores of styles of graftage fall naturally into three main groups:

1. *Inarching, or grafting by approach*, the uniting of two plants before the severance of the scion from the plant upon which it grows. After union the scion is severed below the point of contact and the parts of the stock above this point are removed. The method is rarely practised except with subjects hard to graft by more popular methods and for correcting defects of form, such as Y-crotches in fruit trees, a living brace being formed between the two arms. Since it is the only graftage found in nature, it is supposed to be the progenitor of modern methods.

2. *Budding or bud-grafting*, the inserting of a single bud beneath the bark of the stock or in some cases (for example, annular or ring budding) in the place of a piece of bark removed. It is always practised upon small stocks preferably under two years old, and always when the bark readily separates from the wood as in spring or late summer. Since spring is a very busy season in nurseries, budding is practically all done during summer. The universally popular method is the shield, so-called from the shape of the scion. It is practically the only method employed in propagating the stone fruits—peaches, plums, etc. The seedling stocks, which are usually not less than one-fourth inch in diameter, are stripped of their leaves close to the ground, are cut through the bark twice on the shady side, the cuts forming a T, the bark lifted gently with the specially formed ivory knife-handle, and the bud inserted and tied with raffia, bast or cotton. A small portion of the bark and a little of the leaf stalk accompany the bud, the latter to act as a handle. In about two weeks, if the bud has taken, the binding is cut on the side opposite the bud to prevent "strangulation." In case of a failure other attempts are made. No visible growth occurs during that season, but in the spring the bud should become a shoot and the original top of the seedling stock should then be cut a few inches above the union, and later, when the union is firm, this stub is cut off short. At the close of that season the tree is ready for sale.

3. *Grafting proper*, the inserting of a twig into a stock. The methods under this heading may be divided according to the maturity of the scion whether dormant or growing, and also as to the position the graft occupies, whether upon the root, the crown, the stem or the branches. By far the largest amount of grafting is done with dormant wood, and probably upon roots, though grafting upon the branches is widely popular. In *whip-grafting*, which is the one most practised with roots, especially in the nursery propagation of apples and pears and performed in early winter, the seedling roots are specially grown and are as nearly the size of the scions as possible. Both stock and scion are formed alike, two cuts being made, one rather long, diagonally across, and the other parallel with the direction of growth, thus forming a sort of tongue. The tongue of each is then fitted into the slot of the other, the pieces wrapped with waxed string, and stored in a moist, cool place until spring, when they are planted in the nursery. Usually they are sold after two seasons' growth.

*Cleft-grafting* is most frequently used upon

parts of trees above ground or with grapes just below the surface. The stock is sawed across at right angles to the direction of growth, split with a knife and held open with a wedge until the twigs (scions) bearing two or three buds and whittled to a wedge form below are inserted, one at each end of the slit. The wedge is then removed and the wounded surfaces waxed. This method is practised most upon stocks too large for whip-grafting, limbs even as large as three inches in diameter being sometimes used. As a rule small stocks give more satisfactory results. The method is universally employed to change long-established trees to other varieties.

Some other frequently employed methods are: (1) *Bridge-grafting*, which is used for saving young trees that have been girdled by mice or rabbits or otherwise deprived of their bark. The edges of the injured surface are trimmed above and below, and scions, with wedge-shaped ends, are fitted beneath the bark at each of these points. The whole is then covered with wax. Any sprouts that appear are rubbed off so as to force all growth into the stem. The scions soon unite upon their sides as well as to the original trunk. (2) *Veneer-grafting*, which is widely used in greenhouses, consists in inserting a scion upon the side of the stock, binding and protecting it from the air. The method is practised with both ripened and immature wood.

Protection from the air is gained in budding by bringing the bark of the stock in close contact with the scion and by bandages; in grafting, by applying a bunch of damp moss (a greenhouse practice) or covering of grafting wax, grafting clay, etc. (outdoor practice). One of the most popular waxes is made as follows: Melt and thoroughly mix together 3 pounds of mutton tallow, 5 of beeswax and 10 of resin; pour into cold water and work with the hands until the color of pulled molasses taffy. Apply closely while warm enough to spread readily by pressure of the hand. For use in *whip-grafting* balls of woolen yarn are soaked in melted wax and wound around the grafts. Soft waxes are less useful, since they are likely to melt on warm days and in warm climates. No horticultural practice except that of cuttage can compare with graftage in extent of usage and apparent necessity. Like cuttage, its strong points are ease and certainty of operation, maintenance of a variety "true to type" with the comparatively rare exceptions of bud variation, and the modifications which it permits in the habits of plants. Some of the more important of these last are dwarfing, produced by grafting a strong growing scion upon a small growing stock, as pear upon quince; hastening or increasing fruitfulness, as when scions from bearing wood are top-grafted or budded upon young established trees already in the orchard; to counteract injuries (see *bridge-grafting* above); to change poor or unproductive trees into useful ones (see *cleft-grafting* above); to make possible the growing of certain trees upon uncongenial soils, as peaches budded upon plum stocks for heavy soils and plums upon peach stocks for light soils, etc.

Much popular misconception exists as to the limits of grafting. In many instances the possibilities have been found wholly within the individual species; that is, various different but re-

lated species fail to unite and grow. Generally, however, the limits are within the genus; for example, plums, peaches, cherries, apricots, etc., readily thrive upon one another. Again there are a few instances of different genera which unite, as among cacti. Genera are, however, arbitrary, man-made groups. Permanent unions between oaks and roses, grapes and pears, and similar widely separated plants have not been reported by reputable horticulturists. Consult Bailey, 'Cyclopedia of American Horticulture' (New York 1900-02); id., 'Nursery Book' (id., 1896); Fuller, 'Propagation of Plants' (id., 1894); Baltet, 'L'Art de Greffer,' and its English translation, 'Budding and grafting.'

**GRAFTON**, Mass., town in Worcester County, on the New York, New Haven and Hartford and the Boston and Albany railroads, about six miles southeast of Worcester and nine miles northwest of Milford. In 1728 the first permanent white settlement was made, and the town was incorporated in 1735. As early as 1660 John Eliot (q.v.) established here a settlement of Indians whom he had converted. The manufactures are cotton goods, threads, boxes, boots and shoes, emery, and underclothing. The government is regulated by annual town meetings. Pop. 5,705. Consult Pierce, 'History of Grafton' (Worcester 1879).

**GRAFTON**, N. Dak., city, county-seat of Walsh County, on the Park River, the Great Northern and the Northern Pacific railroads, 15 miles west of the Red River of the North. It is in the great wheat region, and is the trade centre of Walsh County. It has grain elevators, flour-mills, a creamery, machine shops and cattle-yards, and manufactures farming implements. It is the seat of the State Institute for the Feeble-Minded, contains a hospital and a Carnegie library. The city owns the water-works and electric-lighting plants. Pop. 2,229.

**GRAFTON**, W. Va., city and county-seat of Taylor County, located in the northern part of the State, 100 miles southeast of Wheeling, and 100 miles east of Parkersburg and on the Tygart Valley River and the Baltimore and Ohio Railroad. The city is the terminus of four branches of the Baltimore and Ohio and owes its importance to the establishment there of the Baltimore and Ohio Railroad machine shops. Grafton has flour and planing mills, a pottery, foundries, cigar and glass factories, and is also engaged in mining and agriculture. There are 10 churches, public and parochial schools and four banks, with a combined capital of \$300,000; two weekly and one daily newspapers. A national cemetery is within the city limits containing 1,265 graves, 600 of which are nameless. Municipal affairs are administered by a mayor and two city commissioners elected for three years. The city owns its waterworks. Grafton was founded in 1854, incorporated in 1856 and received its charter as a city in 1899. The population are mainly German and English. Pop. about 9,000.

**GRAHAM**, grām, **Charles Kinnaird**, American civil engineer: b. New York, 3 June 1824; d. Lakewood, N. J., 15 April 1889. He entered the navy in 1841, during the Mexican War, served with the Gulf squadron, after study of engineering was appointed constructing engineer of the Brooklyn navy yard, whose

great dry-dock and landing-ways were built by him. At the outbreak of the Civil War, he volunteered in the Federal army, and during the war he was twice wounded at Gettysburg and there taken prisoner; commanded the gun-boat flotilla in General Butler's expedition up the James River, and was brevetted major-general of volunteers (1865). He was successively chief engineer of the New York dock department in 1873-75, surveyor of the port in 1878-83 and naval officer in 1883-85.

**GRAHAM, George Perry**, Canadian statesman; b. Egansville, Ontario, 31 March 1859. First employed as a teacher, which profession he abandoned for journalism. He entered the provincial legislature of Ontario in 1890, was provincial secretary 1904-05 and leader of the opposition 1907. He entered the Canadian House of Commons in 1907, and was Minister of Railways and Canals in the Laurier administration, 1907-11.

**GRAHAM, Hugh**, **BARON GRAHAM** of Montreal, Canadian newspaperman; b. Huntingdon, province of Quebec, 18 July 1848. He was educated at Huntingdon Academy. His career forms one of the romances of modern journalism. At 15 he entered the office of the *Montreal Daily Telegraph*, of which he became manager two years later. At 19 he was able to buy a half interest in the *Montreal Star*, a paper which he founded, and two years later was sole proprietor. He has devoted his life to the paper, and made it one of the most influential journals in the Dominion. He has been closely identified with the principal patriotic movements in Canada for the past 30 years, is an ardent imperialist and is closely identified with many charitable institutions, especially those of Montreal, to which he has been a liberal benefactor. In 1908 a knighthood was conferred on him, and in 1917 he was raised to the peerage—the first newspaperman in the British overseas dominions and the first native Canadian to be so honored in this way.

**GRAHAM, Isabella (Marshall)**, American educator and philanthropist; b. Lanarkshire, Scotland, 29 July 1742; d. New York, 27 July 1814. From 1774 she was a teacher in Scotland, where, in Edinburgh, she inaugurated the work which led to the organization of the Society for the Relief of the Destitute Sick. In 1789 she removed to New York, and there for several years conducted a successful school. Her philanthropies were many, and were particularly in the interests of education, religious and secular. She founded in 1814 the Society for the Promotion of Industry Among the Poor.

**GRAHAM, James Duncan**, American topographical engineer; b. Prince William County, Va., 4 April 1799; d. Boston, 28 Dec. 1865. Graduated from the United States Military Academy in 1817, he entered the corps of topographical engineers, in which he attained major's rank in 1838, was astronomer to the survey which determined the boundary line between the United States and the republic of Texas (1839-40), and later United States astronomer in the joint survey of the boundary between the United States and the British provinces. In the determination also of the boundary between the United States and Mex-

ico he held a similar post. Subsequently he directed harbor improvements in the lakes of the North and Northwest, in which he was the first to detect the presence of a lunar tide, and was superintending engineer of the Boston harbor sea-walls and of repairs in various harbor-works along the Atlantic Coast.

**GRAHAM, John**, **VISCOUNT DUNDEE**, commonly called **CLAVERHOUSE**, Scottish commander; b. near Dundee, Scotland, about 1649; d. Killiecrankie, 27 July 1689. He was educated at the University of Saint Andrews, went abroad and entered the service, first of France and afterward of Holland, distinguished himself at the battle of Seneff in 1674, but returned to Scotland in 1677, where he was appointed captain of a troop of horse raised to enforce compliance with the establishment of Episcopacy. He distinguished himself by an unscrupulous zeal in this service, and waged an exterminating war against conventicles. The Covenanters were driven to resistance and a body of them defeated Claverhouse at Drumclog on 1 June 1679. The Duke of Monmouth, however, defeated the insurgents at Bothwell Brig on 22 June, and Claverhouse was then sent into the west of Scotland with absolute power and exercised it in such a manner as to lead to the belief that in addition to the persecuting policy of his superiors he was actuated by personal revenge. The more terrible he made himself to the Covenanters the more acceptable his career was to the government. He rose to the rank of major-general and became a member of the Scottish Privy Council. In November 1688, after William had landed, he received from James in London the titles of Lord Graham of Claverhouse and Viscount Dundee. When the king fled he was in London, but was permitted to proceed to Scotland. He made his escape from Edinburgh with a small company of horse, declared for the king and speedily got together an army of Highlanders, 2,500 strong. He was followed by Mackay, on behalf of the Convention of Estates, whom he finally encountered in the pass of Killiecrankie and thoroughly routed, but was himself slain in the hour of victory. After that, his army melted away. Attempts have been made by Sir Walter Scott and others to throw a halo of romance and heroism around his character; but he was the willing instrument of a cruel government, of the worst government that ever ruled in Scotland, and had himself little sentiment or softness in his nature. Consult Napier, 'Memorials and Letters of John Graham of Claverhouse' (1859-62); biographies by Barrington (1911); Mowbray Morris (1887); and Terry (1905); and Scott's 'Old Mortality' for the Cavalier point of view.

**GRAHAM, Sylvester**, American reformer; b. Suffield, Conn., 1794; d. 1851. He studied at Amherst College, was ordained to the ministry of the Presbyterian Church about 1826 and became known as a lecturer on temperance and dietetics. His proposed cure for alcoholism was based upon a vegetarian diet. The article of food made of unsifted wheat flour and known as Graham bread was introduced by him into general use. His writings include 'Bread and Bread-Making,' and the 'Graham Lectures on the Science of Human Life' (1839).

**GRAHAM, Thomas**, Scottish chemist: b. Glasgow, 20 Dec. 1805; d. London, 11 Sept. 1869. He was educated at the University of Glasgow, and in 1828 communicated to the Royal Society of Edinburgh the results of experiments on the absorption of vapors by liquids. In 1831 he laid before the Royal Society of Edinburgh the result of a series of experiments on 10 different gases, from which he arrived at the conclusion that gases tend to diffuse inversely as the square root of their specific gravities, a conclusion which has been received as the law of the diffusion of gases, and was the inventor of "Graham's tube." From 1837-55 he was professor of chemistry in the University of London; in 1840 he received the gold medal of the Royal Society, and in the same year was chosen first president of the Chemical Society, which he had assisted in founding. He now began to be employed as consulting chemist in various mercantile and public undertakings, and it was by his recommendation that wood-spirit, or methylic alcohol, was used to render spirits sold free of duty for trade or scientific purposes unfit for consumption as a beverage. In 1846 he assisted in founding the Cavendish Society, of which he was elected president, an office he retained till the close of his life. At the same time he was engaged in investigations on the diffusion of liquids and was the earliest to fully develop that theory. He was appointed master of the mint in 1855. He made many other important discoveries, and was the author of 'Elements of Chemistry' (1842) and various professional papers.

**GRAHAM, William Alexander**, American politician: b. Lincoln County, N. C., 5 Sept. 1804; d. Saratoga Springs, N. Y., 11 Aug. 1875. He was graduated from the University of North Carolina in 1824, was admitted to the bar in 1826 and entered practice at Hillsboro. From 1833 he was repeatedly elected to the House of Commons, of which in 1839-40 he was speaker. In 1840-43 he was in the United States Senate, in 1844 and 1846 was elected Whig governor of North Carolina, declined a third term, and in 1850-52 was Secretary of the Navy, in which capacity he organized Perry's expedition to Japan. Though at first opposed to secession, he later identified his fortunes with those of his State, and in 1864 took his seat in the Senate of the Confederacy. Subsequent to the war he was an executor of the Peabody fund for the promotion of education in the South and a member of the commission for settlement of the undetermined boundary line between Virginia and Maryland.

**GRAHAM LAND**, a tract of land, the northern extension of Antarctica, discovered in 1832 by Bisco, master of a British sealer. In 1894 Larsen, a Norwegian, reported the discovery of a continent, one portion of which he named King Oscar II Land and another part Foyn Land. Both proved to be on the coast of Graham Land. The Belgian expedition of 1897-98 explored the west coast, and gave it the name of Palmer Land, in honor of Nathan Palmer, an American sealer, who discovered this coast in 1818. Otto Nordenskjöld spent two years in Graham Land (1901-03); and Charcot, the French explorer, made a series of important surveys between 1905 and

1909. Graham Land is a political dependency of the Falkland Islands. Whaling has within recent years attained importance. A meteorological station has been established by the Argentine government.

**GRAHAMITE**, a jet black native hydrocarbon or asphalt occurring in veins in various rocks. It is used mostly for roofing materials, also for varnish, rubber substitutes and filler for building blocks. When softened with asphalt it is more rubbery and elastic than gilsonite and less affected by changes of temperature. Occurs in Atoka, Le Flore; Pushmataha and Stephens counties, Okla., and near Granby, Grand County, Colo. Formerly extensively produced in Ritchie County, W. Va., 25 miles south-east of Parkersburg. The production in 1916 was 8,431 short tons, valued at \$92,555.

**GRAIL, The Holy.** The cup or bowl from which Christ drank at the Last Supper. The history of the grail as given in most romances is substantially as follows: After the Last Supper the cup came into the possession of Joseph of Arimathea, who caught in it some of the blood that flowed from the wounds of the crucified Saviour. Being miraculously conveyed to England to escape persecution, he carried the precious vessel with him. Throughout his life it furnished him with food and drink, and with spiritual sustenance as well; and at his death he charged his successor to guard it faithfully. It was handed down from generation to generation, the Fisher King being a descendant of Joseph. This vessel is the grail. According to other versions, the grail chooses its own knights. It possesses miraculous properties, and at times is instinct with divine life. To discover its abiding-place and become one of its guardians is the ambition of good and valiant men, but only the pure in heart may find it. One form of the legend represents three of Arthur's knights, Galahad, Perceval and Bors, as being blessed with a sight of the holy relic. Galahad is said to have had it in his possession, who at his death transferred it to Perceval, and after the death of the latter the cup was taken up into heaven. Students of folklore connect Perceval of the Christian legend with the Siegfried of early German literature and Celtic mythology, but the account of a sacred spear and bowl, as given in the grail romances, appears to be mainly of Christian legendary origin, and to be based upon the lives of saints and certain apocryphal books of the New Testament, principally the Gospel of Nicodemus. It is probable that the Perceval story was familiar, in one or more of its many different forms, to the people of western Britain, before their conversion to Christianity. When the French romancers of the 12th century began to develop the grail idea,—the idea of a sacramental symbol, dwelling among men but discoverable only by the brave and pure,—they wove into their narrations tales of chivalry, mysterious adventures and legends of folklore. Chretien de Troyes, who was possibly the first writer from whom a grail romance has come down to us, was evidently intending to fuse certain elements of the grail and Perceval legends. He began his work about 1189, but died without completing it. Chretien's poem was taken up by several other French writers after his death. An introduction was fitted to it,

in which a violent attempt was made to reconcile the Christian and heathen elements. Many thousands of lines were also added, by various hands, in the early years of the 13th century. Meanwhile, probably before the end of the 12th century, Robert de Borron had written, in Old French verse, a trilogy, 'Joseph,' 'Merlin,' 'Perceval,' of which the 'Joseph' and part of the 'Merlin' have been preserved. It was he especially who gave to all the material a Christian character. There are also later prose adaptations of his work. Great difficulty is occasioned by our ignorance of where to place the French prose romance, the 'Queste del Saint Graal,' generally attributed to Walter Map, or Mapes, and another, the 'Grand Saint Graal,' often accredited to Borron. In these the Christian symbolizing tendency is strong, and the story of Perceval is buried under many complicated tales of knight-errantry. They were, however, probably written before 1204. The 'Queste' having been one of the romances followed by Malory in his 'Morte Arthure,' the Galahad story has had a marked influence upon later literature. There are several other members of the early cycle of grail romances, but only one is of great importance,—the 'Parzival' of Wolfram von Eschenbach. The 'Parzival' is his *magnum opus*. It is also the finest narrative poem of which the authorship is known, between the era of classical antiquity and the 'Divine Comedy' of Dante. Furthermore, it is the most complete, and virtually the final, mediæval handling of the two great themes which are involved in the legend of the holy grail, and which Wolfram more thoroughly blends than any other poet.

During the next 250 years it was the mission of the legend of the holy grail to be the spiritualizing tributary of a broader stream of literature, the full current of Arthurian romance. It then remained in obscurity until the 19th century. Modern English and German poets, in reviving the story of the grail, have been moved by the same moral earnestness as Wolfram von Eschenbach, and by the same desire to show the way to seekers after the spiritual life. The best known of the many modern embodiments of this legend are Tennyson's 'Holy Grail' in the 'Idylls of the King,' and the text of Wagner's musical drama 'Parsifal.'

**GRAIN**, the seeds of cereals cultivated for the production of meal, flour or other forms of cereal food, and for the feeding of livestock. The principal grains are wheat, oats, corn, barley, rye, rice, emmer, einkorn, spelt, millet,

proso and sorghum. Buckwheat, though not a true grain, is usually included. All kinds of grain contain nutritious substances of a similar character, although they vary, both in quantity and proportion, in various grains. These elements are: (1) Gluten, which affords the tissue-building nourishment for the animal body; (2) Fecula or starch, which provides the bodily heat and energy; (3) A sweet mucilage called dextrin, which is more nutritious than starch, but is small in quantity, and renders the grain liable to the vinous and acetous fermentation; (4) A small proportion of fat, ranging from 1 per cent in barley to 6 per cent in oats; (5) A digestible, aromatic substance contained in the hulls, which consist of fibrous matter; (6) Moisture, which is predominant even in the driest grain, and increases the weight of the mass, although it lessens the specific gravity; it affords no nourishment, hastens the decomposition of all kinds of grain, if they are not kept very dry, and influences germination.

According to the 1910 census, grain constituted 48.6 per cent of the total value of all farm products in the United States. The grains are used principally for human food, although very large quantities are fed to poultry and cattle and other farm animals. The greater part of the oat crop goes to feed horses, and a large portion of the corn crop is used in fattening swine. It has been estimated that grain products supply about 43 per cent of the nitrogenous part of human food, 9 per cent of the fat and 62 per cent of the starch. Besides being ground to make flours and meals, and a variety of cereal food preparations, quantities of grain are used in making beers and other malt liquors and distilled liquors. Other quantities are made into glucose and vinegars, besides the multitudes of smaller quantities used in the arts.

The efforts to improve the food quality of the grain crop and to increase its acre-yields are unremitting. In Germany alone there were before the European War 46 breeders of rye, 84 breeders of wheat, 64 breeders of barley and 53 breeders of oats. In the United States and Canada every agricultural experiment station is busy with the same problems, and with such success that the possible yield of grain has been raised within a few years, through the introduction of new varieties, by four bushels for every acre sown.

Grain is so large a part of the world's food that its collection and distribution is an important part of the world's business. In the United States and Canada it is usually handled in bulk, although in a few localities, notably on the Pacific coast, it is generally marketed in bags. From the grain farms it is hauled in the farmer's wagon to the nearest railway siding, where the grain is emptied into the chute of a "receiving house" or railway elevator holding about 5,000 bushels. It passes through a cleaner which removes all dirt, grass and bits of straw and sticks, into the "boot" of the elevator "leg"—a tube in which an endless belt carries attached buckets to the top, or head, of the elevator. From there it is distributed to one of the grain bins. Freight cars are run in under the spouts of the elevator, the grain is carried up to the elevator head again, thence into a hopper where it is

weighed, and then loaded into the cars. These cars are made up into trains for Kansas City, Saint Louis or Chicago, as the case may be. Arrived at one of the great elevators the grain is again weighed and carefully graded, and a warehouse receipt issued for it. Through this receipt it goes into commerce, and the grain may be sold and resold many times with the transference of the receipt. From these central elevators it is eventually loaded into cars, barges or steamships, depending upon its destination.

Grain is sold generally by sample. Each grain has its particular grades—as, for instance, of wheat: white winter, red winter, hard winter, hard spring, western red, western white, etc. These are market divisions, and more or less arbitrary, as there are no fixed standards. All grain is inspected as it comes into the market, and again as it goes out into commerce. This inspection may be done by a local board of trade or officially by the State.

In the United States a series of reports on the current condition of the grain crops of the country is issued every year by the Bureau of Crop Reports. They begin with a report in March upon the amount of grain still in the hands of the farmers at that time. The April report tells the condition of the winter wheat and rye. In May another report on the winter grain crop tells the acreage which has been abandoned as not worth harvesting. In June the report gives the condition figures for the growing winter grain, and the acreage and prospects of spring wheat. The July report gives the acreage of corn planted and the stocks of grain at that date remaining in the farmers' hands, and also another set of condition figures by which the crop about to be harvested may be very closely estimated. In September the official estimate of the wheat and rye crops is given, and in October the official estimate of the corn crop and the spring grains. In December the actual yields of all grains are given. Aside from the government reports, the grain exchanges and the large commission houses throughout the country receive reports from their own correspondents resident in the grain regions, and there are also special experts who travel about the grain country making estimates and reporting privately to their principals, the grain dealers.

The world's production of the principal grains, according to the latest figures of the United States Bureau of Crop Estimates, is as follows: Oats (1915), 4,783,778,000 bushels; wheat (1915), 4,216,806,000 bushels; corn (1914), 3,864,279,000 bushels; rye (1915), 1,711,158,000 bushels; barley (1915), 1,542,972,000 bushels. The grain crop of the United States in 1915 was: corn, 3,054,535,000 bushels; oats, 1,540,362,000 bushels; wheat, 1,011,505,000 bushels; barley, 237,000,000 bushels; rye, 49,190,000 bushels. See articles under the names of the different cereals. Consult Bailey, E. H. S., 'The Source, Chemistry and Use of Food Products' (Philadelphia 1914); Carleton, M. A., 'The Small Grains' (New York 1916); Sherman, H. C., 'Food Products' (New York 1914).

**GRAIN ELEVATOR**, a structure equipped with adjustable elevating machinery for the purpose of unloading and storing grain,

which is subsequently loaded directly into railway cars, canal boats or grain-carrying vessels for transportation. In addition to these primary services the modern grain elevator has machines for cleaning the grain, drying it if necessary and weighing it.

The smaller or "country" elevator consists generally of a building or "house" surmounted by a smaller structure called the "cupola." The house is divided into a series of deep storage bins, while the cupola contains the machinery for operating the "elevator leg," the turnhead spouts, the garners, the weighing machines and the cleaning machinery. It is usually constructed of timber with brick outside walls for the house, and corrugated sheet iron for the roof and walls of the cupola. Many elevators,

practically fireproof, are built with solid brick walls enclosing steel bins surmounted by steel framed cupolas roofed with terra-cotta or sheet iron, while in others the construction is of structural steel encased with concrete. Further protection is obtained by housing the steel storage bins and the operating machinery in separate fireproof buildings, the grain being handled between them by a system of pneumatic conveyers. Since 1902-05, a period of experimentation with not a few failures, the preferred material for grain elevator construction has been reinforced concrete, even for the smaller buildings. The first cost is usually 20 per cent higher than for wood, but the very large saving in insurance and depreciation soon account for that difference. The larger plants are now built with a "working house" and a storage section adjacent. In the working house is gathered all the machinery, and it often contains considerable storage room. The concrete bins are cylindrical and built touching each other, and the spaces between them are also used as storage bins. The largest grain elevator

# GRAIN ELEVATORS

1 and 3 Grain Elevators

2 Concrete Silo

of this type in the world has recently been completed for the Armour Grain Company, on the Calumet River at Chicago, at a cost of \$3,500,000. The working house has 93 bins 14 feet in diameter and 74 feet high, with a capacity of 931,000 bushels. The main storage bins are 130 in number, 22 feet in diameter and 104 feet high, with a combined capacity of 4,383,000 bushels. The working house has six receiving legs, six shipping legs, eight cleaner legs, five clipper legs, three screening legs, six drier legs and three bleaching legs. Each leg has a capacity of 10,000 bushels per hour. The walls of the storage bins are uniformly 7 inches thick. Some of the great Canadian elevators have bins over 30 feet in diameter and 8 inches thick.

There are two distinct types of grain elevating machinery: that in which the grain is carried up by buckets attached to an endless belt traveling in the "leg," and the pneumatic elevator, in which the grain is sucked up a tube by a current of air. In the first type the leg is a two-chambered construction, the endless belt carrying the buckets running up one chamber and down the other, the whole being capable of vertical adjustment—hoisted high so as to pass over the side of a great ship, or lowered so as to touch the bottom 40 feet or more below. In operation the leg is lowered into the cargo of grain and swiftly running belt scoops up the grain in its buckets and empties it in a receiving chamber. Here it is taken by another belt called the lofting belt and carried to the top of the elevator to a hopper known as the garner. Immediately below the garner is the weighing apparatus into which the grain falls through a spout, and from which it is sent onward to the cleaners if necessary and then to the storage bins. In the pneumatic system there is no leg, but the suction tube hangs from the end of a hollow crane-like boom which can be swung over the vessel to be unloaded. This tube is flexible and telescopic, so that it can be made to reach any level and into the farthest corner of the vessel's hold. A powerful vacuum pump at the inner end of the boom exhausts the air in the tube, and the air in the hold of the ship rushes up to fill the vacuum, taking the grain along with it to the vacuum chamber. From here it is directed to the scales, cleaners and bins. There are several advantages in the pneumatic system not possessed by the other. The suction tubes are flexible and extensible, and may be moved to any point in a ship where the grain may be: the elevator leg is rigid and the grain must be brought to its foot by hand labor or by supplemental machinery. In the matter of the health and comfort of the laborer also the pneumatic system leads, as it produces neither the dust nor the heat of the bucket elevator. On the other hand, the operation of the pneumatic elevator is considerably more expensive and this has militated against its installation in many of the newer and larger elevators. The pneumatic system has been very successfully used to transfer grain long distances and in this it has no competitor.

Unloading and storing from cars is accomplished as follows: The grain-laden cars are usually run up along the side of the building so that each car is placed directly under an elevator leg. Two men in each car, operating shovels by ropes from a steam-driven shovel shaft, shovel the grain into the pits of the

elevator leg, and thus fill the buckets of the conveyor, which, operating continuously, carries it up to the cupola, where the buckets are tipped over automatically and their contents discharged into the turnhead spouts. From these the grain passes by gravity into the garner, thence into the hoppers of the weighing machines, thence to the cleaners if desirable, and finally through a system of spouts to the storage bins.

When transferring grain from ships to railway cars the elevator legs are swung outside the house and their feet lowered into the hold of the vessel through the hatchways. The conveyors carry the grain to the turnhead spouts from which it passes to the storage bins, and thence through the floor valves of the bins to the cars placed beneath them. Under such conditions they are called "marine elevators," and when the mechanism is mounted on a barge or float to permit of its being moved from place to place, it is commonly known as a "floating elevator." A carload of 1,200 bushels is delivered in about three minutes.

To load grain from an elevator into the grain-carrying vessels of the Great Lakes, the vessel is made fast alongside the house, and its hatches being removed, the grain is poured by gravity in a perfect torrent into its hold through great spouts which extend to the hatchways from the floor valves of the bins. The discharging capacity of these spouts ranges from 12,000 to 60,000 bushels per hour and load vessels of the greatest capacity in two or three hours. In the largest elevator, where the working house is separate from the storage house, the grain is spouted from the bottom of the bin on to a belt conveyor by which it is carried to the top of the working house where it is weighed and then delivered to the loading spouts.

The loading and storing capacities of individual elevators vary greatly according to their location. Innumerable small structures capable of handling only a few thousands of bushels each are located along the lines of railway traversing the grain-bearing regions of the Western States. These are owned and operated by the railroads. But at the large centres of flour manufacture and grain transportation, such as Minneapolis, Duluth and Chicago, are elevators of mammoth proportions, with individual capacities ranging from 500,000 to 5,000,000 bushels. One of the medium-sized elevators at Duluth is 285 feet long, 85 feet wide and 150 feet high. Nine belt conveyors driven by a 200 horse-power steam engine lift the grain to a height of 145 feet to the turnhead spouts. Each belt carries 125 buckets having a capacity of one peck each, so that the total load at any working instant is about 270 bushels or 15,000 pounds, representing an unloading capacity of 12,000 bushels per hour. The cleaning machines have an individual capacity of 3,000 bushels per hour, and the dryer house passes 2,000 bushels per hour. In many of these larger elevators the motive power is electricity, each machine having its own special motor.

Throughout the grain-producing regions of the West the co-operative elevator has become a very considerable factor in the handling of the country's grain crops. The movement began to take on substantial proportions in the

year 1900. Since then these farmers' co-operative elevator associations have steadily increased until at the present time it is estimated that they handle nearly 40 per cent of the grain sent to market. These elevators are all small, but pay their owners dividends, which range up to 7 per cent, although the average would be nearer 3 per cent. Consult *Grain Dealers' Journal* 'Plans of Grain Elevators' (Chicago 1913); Ketchum, M. S., 'The Design of Walls, Bins and Grain Elevators' (New York 1911); Zimmer, P. G., 'Mechanical Handling of Materials' (New York 1905).

**GRAIN INSECTS.** Stored grain, corn, nuts, and the like, are frequently infested and injured by various insects. About 40 kinds of weevils (q.v.) lay their eggs upon dry grain, and their grubs bore into and devour the kernel, so that when they are numerous great damage may ensue. It has been estimated that the annual loss in the United States from this cause alone is about \$40,000,000. The most important of these pests are the granary-weevil (*Calandra granaria*) and the rice-weevil (*C. oryza*). The former is wingless, evidence that it was domesticated ages ago. It multiplies so rapidly, developing from egg to adult in about six weeks, that five or six generations might be produced annually in a warm temperature. The rice-weevil has well-developed wings, which it seldom uses, showing a strong tendency to become wingless in time. Much injury to stored grain is also caused by other beetles, particularly by three species (*Sitona surinamensis*, *Cathartus gemellatus* and *C. advena*), but they usually follow the attacks of other insects. The cadelle (*Tenebroides mauritanicus*) is to be included in this category, as it has a pernicious habit of gnawing into kernels of grain and destroying the embryo or germ. Great harm in granaries is done also by small moths related to the clothes-moth, whose caterpillars bind the grains together, forming clots, which both spoil the edible quality of the cereal and clog mill machinery. The most familiar of these is the European *Gelechia cerealella*, often called Angoumois grain-moth, but known as "fly-weevil" in the Southern States, where it is so prevalent that grain can nowhere be stored for a long time. Another imported grain-moth, troublesome in the United States since about 1890, is *Ephestia kühniella*; and a third (*Tinea granella*), is especially harmful to wheat in Europe, but not prevalent in America. Injury by the Angoumois grain-moth and the rice-weevil, which obtain entrance to the grain in the fields, can be largely prevented by early harvesting and by threshing as soon as possible. The standard remedy for all grain insects, however, is bisulphide of carbon, applied at the rate of one or two ounces to every 100 pounds of infested grain, which is effective in proportion to the tight closing of the bins. Exposure should last as long as possible, unless the seed is desired for planting, when an exposure of 24 hours is sufficient and will not detract from the germinating power. In buildings that cannot be tightly closed a larger quantity of the insecticide must be used, and repetition of treatment is necessary in warm weather at intervals of six weeks or more. Frequent stirring about of the grain is helpful against these insects; and granaries whenever emptied should

be thoroughly cleaned and whitewashed. See FLOUR AND MEAL INSECTS.

**GRAIN-POISONING.** See ERGOTISM.

**GRAIN STANDARD ACT.** This act of 11 Aug. 1916 authorizes the United States Secretary of Agriculture to investigate the handling and grading of grain and to establish standards for corn, wheat, rye, oats, barley, flaxseed and other grain. On the establishment of any such standard the law prohibits the shipment, or delivery for shipment, in interstate or foreign commerce originating in the United States, of any grain sold, offered or consigned for sale by grade without previous inspection and grading by a licensed inspector, at the place of shipment, at the destination or at some point in transit, provided there is a licensed inspector located at the point of shipment or destination. In this latter case the grain may be shipped without inspection; and if there is any dispute over the grading of it, the matter may be referred to the Secretary of Agriculture by either of the parties to the transaction. The act provides for a public notice of not less than 90 days in advance of the date on which any new standard shall become effective. The object of the law is to provide a uniform system of grading staple crop products, and in this way affording the farmer incentive to improve the quality of his product by the careful selection of varieties, skilful culture and effective methods of harvesting and handling. Many of the States have passed similar laws and ranged themselves by the side of the Federal legislature for the improvement of standards in grain.

**GRAINING.** (1) In leather manufacture the process of rubbing leather with a board to raise the grain. The leather having been shaved to a thickness at the beam and daubed is hung up to dry, and is then folded, grain side in, and rubbed on the flesh side with a pommel or crippler to give the leather a granular appearance and render it supple. The hide is then extended and rubbed on the grain side. This is termed bruising. Also a process for giving markings to the surface of leather to imitate the wrinkled appearance of morocco, hog-skin and some other leathers.

(2) In painting, the imitation of the natural grain of wood by means of tools. Combs, brushes, rollers and the corner of a folded rag are used in making the various patterns.

(3) In lithography, a mode of giving a certain texture to the face of a stone. One stone is laid on another with a quantity of sifted sand of a given fineness, and by a peculiar oscillation and gradual progression the surface is cut into a set of fine prominences more or less deep and distant, according to the character of the work to be placed on the stone.

**GRAKLE**, grāk'l, the name of several kinds of birds. In the United States the black-birds (especially the larger ones) of the family *Icterida*. (See BLACKBIRD). In India and eastward a mina-bird (q.v.) or some related bird formerly classified in the miscellaneous group *Gracula*.

**GRAMINEÆ**, grā-mīn'ē. See GRASSES.

**GRAMMAR** is the systematic treatment of the expression of thought by means of language. Grammar is often called a science, but in its present state it cannot rank with sciences

like astronomy, or chemistry, for instance. For one thing, it has not the power of prediction. Adams and Le Verrier, the one in France, the other in England, were able, from observed disturbances in the solar system, to determine that there must be a yet undiscovered planet, and to calculate its orbit and position so accurately that observers, turning their glasses on the specified locality in the heavens, found the planet Neptune. Grammar has no such power. All the linguists of Europe could not have predicted in advance of discovery what the Chinese language would be like; nor could all the linguists of the world determine what would be the language of some people of unknown origin who might be discovered to-morrow. The laws of chemistry appear to be universal. The same elements exist in the stars, the planets and the sun, as upon the earth, and so far as our knowledge yet reaches, only the same. Helium was first discovered by the spectroscope in the sun, but by later research found upon the earth. Hydrogen and oxygen will combine in the very same proportions to form water in India as in Europe. But grammar can command no such certainty. Its facts change from tribe to tribe, from dialect to dialect and with most puzzling and baffling variations. The crossing of a mountain or a river throws the scholar into some new system of grammatical construction. Hence grammar for practical purposes must be viewed chiefly as a constructive art. In no department of learning is there less room for dogmatism. The scholar cannot say what shall be, or what should be. He does well if he can discover and clearly explain what is. The "rules" of grammar in any language can be no more than the statement of the existing facts of that language, as scholarship has discovered, and has been able to co-ordinate them.

It is obvious that language must have existed long before grammar. Man would find means of intelligent expression long before he could give systematic explanation of the reason for various forms of expression. In fact, the earliest grammar known to the modern world is the Sanskrit grammar of Panini (about 300 a.c.), giving in 8 books, with 3,000 sections, the rules for classical Sanskrit. But Panini himself enumerates 64 grammatical predecessors, and the oldest Sanskrit literature is conventionally placed at 1500 a.c., though undoubtedly much older. A language, however, must exist in a tolerably complete form before a literature can be composed in it, so that the Sanskrit language reaches beyond the earliest Sanskrit literature far back into a dim antiquity. The language had existed for unknown centuries, and had been the medium of a great literature for probably a thousand years before its grammar began. The impulse of the Sanskrit grammar was religious, for on the correct rendering of any verse of its sacred books salvation might depend. Greek grammar had an independent and later origin. Its impulse was philosophical and literary. The Homeric poems were the monuments it most eagerly studied. But those poems are placed at 1100-900 a.c., while the first notable, though disconnected, observations on grammar were made by Plato (427-347 a.c.), and Aristotle (384-322 a.c.), carried grammatical analysis so far as to distinguish *nouns*, *verbs* and *connectives*. It

was not until Dionysius Thrax ("The Thracian"), who taught in Rome in the 1st century a.c., composed his 'Art of Grammar,' that the grammar of the Greek language had full development. Thus again about a thousand years elapsed after the fullness and power of the Greek language had been revealed in the 'Iliad' and 'Odyssey,' before grammatical analysis was ready to explain what the language had long since done. The record of English grammar is similar. The first really English grammar was claimed by William Bullokar, who published in 1586 'A Brief Grammar for English,' which he said was 'the first grammar for English that ever was, except my grammar at large.' Ramsey, 'English Language and English Grammar' (pt. I, ch. 3, p. 49).

In 1652 John Wallis published his 'Grammatica Linguae Anglicanae,' explaining English usage in Latin, as did other so-called English grammarians, who still esteemed Latin, as the only scholarly tongue. The earliest of these works was written 500 years after the Norman Conquest and two centuries after Chaucer had shown what the English language by itself could do. Everywhere we find grammar working upon a language already made, and rich enough in words and forms to be the vehicle of a literature before the grammarians submitted it to examination and analysis. Everywhere the office of grammar has been, not to fix what a language should be, or must be, but to explain what an already existing language is. Grammar is explanatory and not creative.

So considered, grammar may be defined as the art of expressing thought by means of connected words. Grammar has nothing to do with unconnected words. We may have a very extensive list of words without grammar, as the names in a city directory; but when we connect them in statement,—as if we say, "George Jones precedes John Jones in alphabetic order,"—grammar at once begins.

Some very learned authors have stated as an axiom that "The sentence is the unit and starting-point of speech." How this idea originated is difficult to understand. It is not a self-evident truth, for one may say, as some have said, that "the name of an object is the unit and starting-point of speech," and this statement is as good as the other until the contrary is proved. The account in Genesis reads: "And out of the ground the Lord God formed every beast of the field, and every fowl of the air, and brought them unto Adam, to see what he would call them: and whatsoever Adam called every living creature, that was the name thereof." Gen. ii, 19.

There is nothing illogical or absurd in this idea that language began with the names of objects. Others have thought that *verbs*, expressing action, came first. Still others have preferred to think that language began with involuntary exclamations, which we now call *interjections*. No one of these theories is self-evidently true or false. The statement that "the sentence is the unit and starting-point of speech" is equally far from being a self-evident truth. In fact, it is a late result of complicated reasoning. If true, it must be proved to be true,—what are the proofs? In every generation millions of children, starting with absolutely nothing, learned their native language. Now, in the acquirement of the modern

European languages, at least, children everywhere learn the language by isolated words. It is a triumph when the little one can say, "Papa" or "Mama," or whatever is the accepted equivalent of either, and apply the name intelligently to the right person. This is the most usual "starting-point of speech," and there is no thought or imagination of a "sentence" about it. Then come names of familiar objects, as "water," "bread," "milk," etc.; then names of common animals, perhaps called according to the sounds they utter, as "doggie" or "bow-wow," "kittie," "birdie," etc. Whoever sees much of the home life of other peoples will find the French, German or Italian mother teaching her baby in precisely the same way, word by word, object by object. It is an event when the little one passes beyond this, and forms its first sentence, as "Mama come," "doggie run" or the like. The construction of a sentence marks a distinct advance of the baby's thought after a considerable store of separate words has been acquired.

The same is true of the learning of a foreign language by an adult. The "conversation-books" of ready-made sentences are the standing joke of travelers. In real life the sentence one has carefully memorized never fits the actual circumstance, and the person addressed never gives the reply that the book prescribes, so that in a moment all is mental confusion. But one who will learn useful isolated words of a foreign language can make himself understood long before he can construct a coherent sentence. If the English-speaking man entering Italy, for instance, will learn certain simple words, as *acqua* (water), *caffè* (coffee), *latte* (milk), *pane* (bread), *Camera* (room), and some 30 to 50 other words or simple phrases, with the numerals and names of coins, he can go all through Italy, communicating sufficiently for ordinary purposes, and gradually learning to construct sentences.

Grammar thus treats almost wholly of the forms, relations and connection of words. The matter is thus stated by one of the most philosophical of modern grammarians: "Grammar, or the doctrine of language, treats of the laws of speech, and in the first place of the *Word, as its fundamental constituent*," Maetzner, 'English Grammar,' Vol. I, p. 12.

There is no grammar of sentences, except when two or more sentences are united in one complex or compound sentence. Pages may be covered, or a volume might be filled, with perfect sentences, no two of which are grammatically connected, and—as *finished sentences*—grammar has nothing to do with them. The first thing that grammar does to a sentence is to take it to pieces to break it up into its component parts, the words of which it is framed, and then to show how these are connected to form that composite thing which we call the sentence.

Words, so viewed, are appropriately classified as "parts of speech." These parts of speech may vary in different languages, but in the Indo-European languages, including Greek, Latin, Italian, French, German, etc., in the Semitic languages, as Hebrew and Arabic, and in other groups, they are practically identical, showing that the division so widely prevalent is a natural and logical one. In English grammars, and in grammars which English-

speaking men have compiled for other languages, these parts of speech retain, with slight change of form, the names given them by the ancient Latin grammarians. The parts of speech are, in the order of their importance:

1. *The Noun*, or name of an object, whether a material object manifest to the senses, or immaterial, manifest only to the mind. The distinction between *concrete* and *abstract* nouns is metaphysical, but not grammatical. Grammar treats the names of abstract conceptions like *love, hate, kindness*, precisely as it treats the names of material objects like *rock, fish, flower*. All alike are nouns. Whatever one can think of as existing may be named by a noun.

2. *The Pronoun*.—A word that may, on occasion, stand in place of, or as the representative of, a noun.

3. *The Adjective*.—According to its name, an *added word*, expressing some quality of an object, while leaving the noun unchanged to stand for the general type.

4. *The Verb*.—This may be described in general phrase as the *action-word*. Even those verbs that express a state of being express it with a suggestion of action or movement, so that "Time *exists*" presents to the mind a more vivid and living idea than the noun-phrase "The *existence* of time." The importance ascribed to this part of speech is shown by the name which the old grammarians gave it. The Latin *verbum* means simply "word" and they called the action-word *Verbum*—pre-eminently "The Word" as controlling in all expression of thought. No sentence can be constructed and no complete thought be expressed without a verb.

5. *The Adverb*.—A word which intensifies or shades down the meaning of a verb and has a like effect on an adjective or on another adverb. It has an especial office as denoting place (as *here, there, everywhere*) or time (as *now, then, never*). In such use adverbs often become connectives, binding clauses together (as *where, when, whence, etc.*), and are then often called "conjunctive adverbs."

6. *The Preposition*.—A particle, often very slight in form (as the English *of, in, with*; Greek *ek* or *ex, en, syn*; Latin *ex, in, cum*), showing some relation of a noun or pronoun to almost any other part of speech, as to a noun, pronoun, adjective, verb or adverb—indicating any one of various relations, as of direction, origin, dependence, etc.

7. *The Conjunction*.—A particle simply joining words, not as expressing relation, but addition or contrast (of which simple forms in English are *and* and *but*). Conjunctions also connect phrases or sentences (clauses), either in the relation of equality (*co-ordinate conjunctions*, as *and, but*) or of dependence (*sub-ordinate conjunctions*, as *if, since, though, unless*).

8. *The Interjection*.—One of the spontaneous utterances of emotion, as of joy, grief, anger, surprise, etc. It is a dictum of grammar that "The interjection is independent of all grammatical relation," yet it often strongly influences the entire meaning of a sentence, as in the exclamation, "Oh, that my people had hearkened to my voice!" where the omission of the "Oh" would make the sentence almost meaningless.

These parts of speech and their uses vary

in many ways in different languages. Thus the Latin or Greek noun can often dispense with the preposition, the meaning of which is expressed by a changed form of the noun. The Latin verb can largely dispense with the pronoun, since person and number are sufficiently indicated by special forms of the verb. The verb in some languages has more modes (or moods) than in others, as the Greek *optative* (the *wishing* mode) is not found in Latin or in English. The number of tenses varies greatly. While the Greek, Latin and English tenses mark quite strictly the divisions of time, as past, present and future, the tenses of the Semitic languages, as Hebrew and Arabic, denote only completed or uncompleted action. The Anglo-Saxon, too, had but one form for the present and future, as we still say, in English, "I sail for Europe to-morrow." But, though the details are different, the general scheme is one. The department of grammar that deals with the parts of speech has received the conventional name of *Etymology*.

**Syntax** (from the Greek *syn-tasso*, to "arrange in order," as the ranks and divisions of an army, is the name given to the department of grammar that treats of the due ordering of words in the construction of the sentence. Here the one demand that must in some way be met in every language is, that the sentence shall clearly indicate: (1) What is spoken of; (2) What is said about it.

These indispensable constituents of the sentence we name the *subject* and the *predicate*. All the devices of grammar have no other end but to keep these absolutely clear, adding incidentally to either such force or effect as may be possible.

In seeking this result one of the chief elements to be determined is, whether the subject of the sentence is to be viewed as the subject or the object of the action; as, "The *engine* draws the train," or "The train is drawn by the *engine*." This gives for the verb the *active* and the *passive* voice and for the noun or pronoun the various *cases*, as the *Nominative* or the *Objective* (also called the *Accusative*) case. Other cases may indicate other relations. In an inflected language like Greek, Latin and others, the cases are indicated by the form of the noun or pronoun, which may, accordingly, be placed almost anywhere in the sentence. In an uninflected language, like English, as there is little distinction of form, the case-relation is ordinarily determined only by the position of words, so that the *order of words* becomes a grammatical element of supreme importance. In the inflected languages it is necessary to learn a vast number of forms (declensions, conjugations, etc.) in order that the meaning intended may be correctly expressed. In an uninflected language grammar spends its force in the due adjustment of largely unchanging forms for the same purpose, that the meaning intended may be correctly expressed. The task and the triumph of grammar in any language is to teach such combination of words in sentences that the thought of speaker or writer shall be conveyed without change or loss to the mind of hearer or reader. See GRAMMAR, ENGLISH; LANGUAGE, SCIENCE OF.

JAMES C. FERNALD,

Editor, 'The Students' Standard Dictionary.'

**GRAMMAR, English.** The first principle here to be established is that in English grammar we are dealing with the English language. English grammar cannot be built up by inferences from other languages. For instance the Greek had a definite, but no indefinite, article; the Latin had no article whatever. Would English have one article or none? The Anglo-Saxon had two articles. Would English follow that? The Anglo-Saxon had a dative case and many another modification which English has dropped. How do we know that English may not have also dropped the article? Conjecture and inference give us no result. We are driven back to a study of facts. What does English have? So we learn that, as matter of fact, English has two articles, the definite and the indefinite. The same might be shown in numberless instances. English grammar is not a system that can be built up by a priori reasoning, but is simply the correlation of the observed facts of English usage.

It has been the misfortune of the English language that in all the early days its grammar was not so treated. The grammatical treatment of the language was begun about the time of the Tudors by Latin scholars and the first textbooks were even written in Latin. English was still regarded as an inferior language—"the vulgar tongue"—and must be shaped as nearly as possible to the model of classical Latin. Even Lindley Murray in 1795 contrasts English with "the learned languages," which for him were notably the Latin and Greek. But English differs from the ancient classical tongues as it does also from most of the leading modern languages, in an almost complete absence of *inflection*—that is, of changes in forms of words to indicate their relations. The eminent English scholar, Dr. George P. Marsh, says in his 'Origin and History of the English Language': "A truly philosophical system of English syntax cannot be built up by means of the Latin scaffolding, which has served for the construction of all the continental theories of grammar, but must be conceived and executed on a wholly new and original plan."

The long-prevalent and futile attempt to shape an uninflected language upon an inflected model cannot be too soon nor too completely abandoned. English must be recognized as a grand language which has started anew in the world, which is built upon a model of its own, not to be shaped to the pattern of any other; and which has proved its right to an independent place by a noble literary history of 500 years, including in its array of masters of

philosophy and science, of statesmen, historians, orators and poets, some of the greatest names of all time; and which has proved itself an effective means of communication by its extension over more than one-fourth of the habitable earth and its use as their vernacular by some 180,000,000 of its inhabitants.

Here stands among the nations the language which has done all this. What are its methods of expression? The rational and direct answer to that question constitutes English grammar. A sufficient definition is that *English grammar is the correct use of English words in English sentences.*

We find, then, as matter of fact, that English possesses the eight parts of speech common in other European languages: *noun, pronoun, adjective, verb, adverb, preposition, conjunction and interjection.* This can be shown to be a very logical division of words, but we accept it, not because it is logical, but because it exists. Some competent grammarians count nine parts of speech by treating the article as separate from the adjective. Nouns and pronouns are credited with the four properties of *gender, person, number and case.*

*Gender* in English is strictly limited to the distinction of sex or of the lack of it. Thus there are three genders. Males are *masculine*, females are *feminine* and inanimate objects, as of no sex, are *neuter*. That is all there is of gender in the language. But it is sufficient. One of the greatest achievements of the English language is the abolition of what is called *grammatical gender*, which in other languages generally prevails. The triumph is so complete that an English-speaking person does not see how any other system could be possible, until he learns what is actually done in other languages.

Grammatical gender is gender arbitrarily imposed upon words without the slightest reference to sex. In French, Italian and Spanish there are but two genders, so that every noun must be either masculine or feminine, even though it may denote an inanimate object. German has three genders, but they are applied in the most indiscriminate way, without any reference to sex in the objects named. Thus, *weib*, meaning "woman, wife," is neuter; so is *Mädchen*, "maiden." *Kopf*, "head," is masculine; but *Auge*, "eye," is neuter; *Arm*, "arm," is masculine, but *Hand*, "hand," is feminine, while *Finger*, "finger," is masculine.

"A German gentleman writes a masculine letter of feminine love to a neuter young lady with a feminine pen and feminine ink on masculine sheets of neuter paper, and encloses it in a masculine envelope, with a feminine address to his darling, though neuter, Gretchen. He has a masculine head, a feminine hand, and a neuter heart. A masculine father and feminine mother have neuter children."—Earle, 'Philology of the English Tongue' (ch. VII, p. 377).

How such a system was ever fastened upon any language is one of the puzzles which the most eminent linguists have not been able to solve, but from the entire complication English has shaken itself free. To know the gender of an English noun, it is only necessary to know its meaning.

The most obvious relations of sex are denoted by independent words; as *man, woman;*

*husband, wife; boy, girl; son, daughter; brother, sister;* etc. But *wife* is not a feminine form of the word *husband*, nor *daughter* a feminine form of *son*, nor *sister* of *brother*. The words are not at all related in form, but only in meaning, and we know them as masculine or feminine only by knowing what they mean.

A small number of special feminines are formed directly from masculines by the ending *ess*, derived from the French; as, *abbot, abbess; actor, actress*, etc. From *hero* we have *heroine*, derived from the Greek. We have also a very few rarely used words from the Latin in *tor*, which form feminines in *trix*; as *executor, executrix*. But these endings do not of themselves constitute feminine nouns, for we have *address, fortress, mattress, quarantine, cicatrix*, which are all neuter. No English noun can be classed as masculine, feminine or neuter, merely by its termination.

The number of nouns with special feminine endings is constantly diminishing. In the time of Queen Elizabeth such words as *butleress, warrioress, waggonness* and many similar forms were used, which have long since disappeared. Others are constantly falling into disuse. It is not now good form to say or write *author-ess, poetess* nor *songstress*. We refer to the woman, like the man, as *author, lecturer, poet, singer*, etc. The genius of the language tends strongly to the disuse of all distinctively masculine or feminine terminations. We even speak of a woman as the *chairman* of a meeting, or as a *postmaster* in the United States mail service. In literary work a woman may be an *editor*, but never an *editress*. In a college she may be *president* or *professor*, but never *presidentess* nor *professoress*.

A small number of masculines and feminines are made by masculine or feminine prefixes, as *he-goat, she-wolf, man-servant, maid-servant*, etc. But this method is passing out of use, so that the number of such forms remaining is now very small.

Even in nouns denoting living beings, English minimizes gender. There is a great class of nouns like *friend, neighbor, stranger, citizen, patriot, assistant, helper*, etc., that unquestionably denote living beings, but give no indication of sex. If a person says, "My friend started for home yesterday," it is impossible to judge from that statement whether the "friend" was man or woman, boy or girl. But we cannot say that the noun "friend" is of neuter gender, like "rock" or "tree." The noun "friend" simply waives the question of gender, makes no affirmation about that matter, but leaves the gender undetermined or indeterminate.

Thus we have a multitude of such familiar nouns as *accountant, acquaintance, advocate, amanuensis, assistant, associate, attorney, citizen, clerk, companion, comrade, cousin, enemy, foe, friend, historian, interpreter, maniac, monarch, nurse, patient, person, physician, relation, relative, reporter, secretary, sovereign, witness*; practically all the uncounted nouns in *er*, the number of which is increased without limit at any one's pleasure; as *buyer, doer, driver, giver, hearer, interviewer, intruder, invader, joker, keeper, locker, maker, mocker, packer, prowler, questioner, reader, receiver, singer, speaker, stenographer, stranger,*

*voyager, worshipper, writer*; all nouns in *ist* as *antagonist, artist, chemist, copyist, geologist, pianist, psychologist, zoologist*; most nouns in *or*, as, *author, contractor, counsellor, doctor, editor, orator, visitor*; most names of animals; as *ape, bear, beaver, bird, butterfly, deer, elephant, elk, fowl, goat, locust, monkey, mule, ostrich, robin, shark, sparrow, swallow*, and innumerable others quite innocent of gender. This non-gender terminology is becoming the prevalent style in English. The fullest list of unrelated word-pairs denoting gender contains only about 70 such words, while the nouns with feminines in *ess* or *tris* do not probably number more than 75 now in approved use. It will be seen that these are incalculably outnumbered by the nouns denoting living beings without specifying gender, of which the list given in this paragraph furnishes but a few specimens.

These nouns indeterminate in gender are often said to be of *common gender*,—a phrase to which there is no special objection, and which has the advantage of being widely and generally understood, as signifying that the word it describes may be either masculine or feminine.

This use, which has limited place in many languages, but which is predominant in English, is in accord with the law of practical efficiency, *not to load down our speech by mention of unnecessary things*. If we say, "That is an error of the *typewriter*," it is not of the slightest importance whether the "typewriter" is a man or a woman. Any one who should explain the sex, and say "That is an error of my typewriter who is a young man,"—or, "who is a young lady,"—would make himself ridiculous. Why, then, should he be required to give this useless information by a *masculine* or *feminine* form of the word? The very thing for practical purposes is a word that has no gender, and gives no indication of sex. The entire tendency of the English language is to banish from its grammar all distinctions of gender except where such distinction is absolutely necessary. This is a great advantage on the score of freedom and simplicity, as well as of the highest linguistic efficiency.

*Person*, in English nouns, is practically negligible. No noun can be used in the first person without a pronoun of the first person accompanying it. Such forms as "I, Paul, say unto you" are correct, but very rare; "Paul say unto you" would be impossible. No noun will be understood to be in the second person, unless by some plain indication of direct address. Nothing in the form of the noun can mark it as of first or second person. That is, *all nouns are in the third person unless an accompanying pronoun or other special indication marks them as of first or second*.

*Number*, as singular or plural, is indicated with special care. On the threshold we meet a conflict of definition, some authorities defining the plural as "denoting more than one"; others, as "denoting two or more." Between these definitions come certain fractional quantities. Shall we say "One and a half ton was delivered" or "One and a half tons were delivered"? The prevailing usage is certainly in favor of the latter form in accordance with the predominant authority of the best modern dictionaries which treat the plural as denoting *more than one*.

The general or regular form of the plural of nouns is obtained by adding *s* to the singular. Where the singular ends in a sibilant sound as *ch, s, sh, x* or *z*, an *e* is inserted for the sake of euphony, as in *churches, bushes, gases, foxes*, etc. This formation of the plural by adding *s* or *es* is so general and so simple that children readily learn it, and incline to use it for all nouns, saying, for instance, *mouses* until taught to say *mice*. There is a very small list of irregular plurals; there are also certain exceptional ones, as of foreign nouns, which may be readily learned by some portion of the pains and care required for learning anything.

*Case* in English nouns is very slightly indicated. There are but two case-forms, and but one change of form for case in either singular or plural. This will startle many who have learned that every noun has three cases, *nominative, possessive* and *objective*. But a moment's thought will show that the regular or common form of the noun undergoes but one change in the singular as, *fox, fox's*. We use the regular or common form as the subject of a verb, or as the object of a verb or of a preposition at pleasure, but in so using it we do not change it in the slightest degree. The only change of form for case in the singular number is by the adding of *'s* for the possessive. The possessive of a regular plural differs from the nominative only by the slight addition of the apostrophe (*'*) in writing or printing. Even this disappears in the spoken language, where *foxes'* is indistinguishable in utterance from *foxes*. A few irregular plurals form their possessives by adding *'s*, as to a singular. Thus we say or write *men's hats; children's shoes*, etc.

The pronoun is the stronghold of *gender*. But for the pronoun, gender might be wholly ignored in English grammar. The two sentences "The *man* spoke" and "The *woman* spoke," differ in meaning, but they do not differ at all grammatically; in each we have a noun as the subject of a verb. But the moment we use a personal pronoun, gender becomes important: "The *man* spoke *his* mind", "The *woman* spoke *her* mind." The pronoun alone has English gender in its keeping.

Yet gender is indicated in pronouns only in the personal pronoun of the third person and singular number. Pronouns of the first person,—*I, my* or *mine, me, we, our* or *ours, us*,—or of the second person,—*thou, thy* or *thine, thee, you, your* or *yours*, are utterly indeterminate in gender. It is only when we come to the forms of the third person that we find gender in *he, his, him, she, her, hers, it, its*,—and there only in the singular number. The moment we pass to the plural,—*they, their* or *theirs, them*,—we lose gender again. Pronouns other than personal, as demonstrative, relative or interrogative,—*this, that, who, which, what*, etc., give no sign of gender. All notification of gender that grammar need take cognizance of is found in the eight pronoun-forms, *he, his, him, she, her, hers, it, its*.

*Case* is fully developed only in the pronoun. Six pronouns, the personal pronouns,—*I, thou, he, she, it*, with their plurals, and the relative pronoun *who*, are the only English words that have distinct forms for the objective case. The only objective forms in the English language are *me, us, thee, him, her, them* and

*whom*,—seven in all. The neuter pronoun of the third person singular, *it*, and the plural of the second person, *you*, are the same in nominative and objective, in modern use. The older English would have added *you*, the nominative being *ye*, but that usage is now obsolete. The seven objectives above named are the only words that can be in the objective case independently of position in an English sentence; as:

*Him th' Almighty Power  
Hurled flaming, headlong from th' ethereal seats.*

*Whom* he would he slew, and *whom* he would he kept alive.

The English *adjective* has no gender, number, person nor case. How much this means, the English-speaking man never realizes until he studies some foreign language, where he finds that, however well he may know a noun, he is powerless to use it with article or adjective, until he knows the gender of that noun, and has settled that one of the varying forms of adjective or article which may properly be used for that noun in that particular gender, number, and case,—which is almost an endless study. By sweeping gender absolutely away from all adjectives (including the definite and the indefinite article) English has completed the emancipation of the language from the oppressive burden of grammatical gender. By the absolute simplicity of the contrivance, all perplexity is banished, and error is made impossible. This is a wonderful linguistic triumph.

The English *verb* has very little inflection. A few verbs undergo some internal change in the past tense and past participle; as, *go, went, gone*. The prevailing system simply adds *d* or *ed* to the present to make the past tense and past participle (which are thus identical in form). The first system has been called, after Grimm and other German philologists, the *strong*, and the second the *weak* conjugation—fanciful names, not generally favored by leading English and American grammarians, but often severely condemned. A common and more intelligible classification designates the forms in *d* or *ed* as *regular*, because they follow the prevailing rule or custom, and those otherwise made as *irregular*, because they are few in number, and vary in arbitrary ways, for which no rule can be given. The irregular verbs afford one of the best illustrations of the statement that English grammar is simply the study and mastery of concrete facts. Those verbs can be learned only by arbitrary memory. It is no more possible to reason out the forms of an irregular verb than to reason out the name of a stranger who is passing on the sidewalk. But there are very few of them. Out of at least 8,000 verbs in the English language all but about 200 form their past tense and past participle by adding *d* or *ed* to the root-form. Every new verb is at once and without question so conjugated; as, *telegraph, telegraphed; corral, corralled*, etc. Also, the number of irregular verbs is constantly, though silently, decreasing. In one list of 215 irregular verbs, 47 are marked as having also the regular form, so that we may say either *awaked* or *awoke, burned* or *burnt*, etc.; and it will be found that in many of these the regular is fast supplanting the irregular form.

Aside from these variations for the past

tense and past participle, the most numerous and constant inflections occur in the use of the second person singular—the forms with *thou*. But it is precisely those forms that modern English has discarded. *Thou*, with its associated verb-forms, has passed entirely out of common English speech or writing, being found only in the older literature, in the language of Scripture, of prayer, etc., and rarely in poetic, oratorical or literary style that is intentionally made archaic. It is found that all these forms can be adequately taught and easily learned in a special department of "The Ancient or Solemn Style," and the ordinary conjugations of the verb flow on unvexed by their inflections. Thus the past tense of *do* is the one word *did*, and of *have* the one word *had*, for all persons and numbers in present use.

Omitting, then, the forms used with *thou*, we find that in dispensing with verb-inflections the English language has broken all precedent. The varying forms of Latin and Greek verbs are counted by hundreds. But (omitting, as above stated, what may be called the "thou system"), the most complicated English verb, the verb *be*, has but eight inflected forms, *be, am, is, are, was, were, being, been*. The verb *be* is alone in this number of inflected forms. No other irregular verb has more than five inflected forms; as, *give, gives, gave, giving, given*. A regular verb has but four inflected forms; as, *love, loves, loved, loving*. The modes and tenses, that express the manner and time of action, are for the most part formed by auxiliary verbs, *be, can, do, have, may, must, shall, will*; and when the forms and combinations of these eight auxiliaries are once learned, they are the same for all our thousands of English verbs.

English syntax is determined by the lack of inflection in the language. An inflected language, as the Latin or the Greek, for instance, could put a noun almost anywhere in the sentence, because the form of the noun would show whether it was the subject or the object of the verb or otherwise accounted for. But in English whether a noun is subject or object of a verb can ordinarily be known only by its position, as subject when preceding, or as object when following the verb. The same is true of most pronouns, seven objective pronoun-forms—*me, us, thee, him, her, them* and *whom*—being alone independent of this rule, since these alone show by their form the relation they bear to the verb or to a preposition. Since in English the adjective has no change of form for masculine, feminine or neuter, for nominative, possessive or objective, singular or plural, the connection of the adjective can likewise be known only by its position, as immediately preceding or following its noun. So the adverb must be placed as close as possible to the verb, adjective or other adverb it is to modify. Many ridiculous constructions arise from a neglect of this requirement.

Some view such an exposition with amazement that is almost dismay. They are ready to exclaim, "Is this all that English grammar has to offer—position?" Hence many carelessly say the "English has no grammar," and Richard Grant White deliberately entitled it "The Grammarless Tongue." This is as if one whose whole idea of numerical notation had been formed by Roman numerals were to be sud-

denly introduced to the Arabic system. He has been accustomed to writing a special letter or group of letters for each number, I, II, III, IV, V, VI, VII, VIII, etc., and you tell him that the figure 1 has no meaning except by position; that it may mean one unit or ten or a hundred or a million or a million million units, according to its place in the line; or that, on the contrary, it may mean one-tenth, one-hundredth or one-millionth of a unit in a certain position after the period. Instead of his complicated system you offer him 10 digits and *position*. In fact, it took the world a considerable time to become sure that this simple system would be adequate. Now mathematicians tell us that the stellar distances could never have been computed by the Roman numerals. The simple decimal system of notation by position is a necessity for intricate calculations; yet, because of its simplicity, children learn it in a surprisingly short time. English speech has rules, just as the Arabic notation has rules; and they are not in either case less imperative because they are simple.

In every sentence there is an *essential subject* (often called the *grammatical subject*), without which the group of words would not form a sentence. This essential subject is commonly known by its position, just as the 1 in 1,000,000 has value by its position. Something is settled by elimination, as the object of a preposition cannot be the subject of the sentence. We say, "The man with his friends *was* (not were) present" because "friends," as the object of the preposition "with," cannot affect the verb. Similarly the object of a participle cannot be the subject—"The writer, seeing the difficulties, *gives* (not give) his consent." "Writer" is there the only possible subject.

In like manner there is some one verb (often called the *predicate verb*) which is the *essential predicate* (or the *grammatical predicate*), without which the group of words would not form a sentence. Around the *essential subject* and around the *essential predicate* may be grouped other words or phrases, forming the *complete subject* and the *complete predicate* respectively. When these are settled we have exhausted the grammar of the simple sentence. If two or more simple sentences are conjoined, we have only to settle the construction of each as a *simple sentence* (commonly then called a *clause*); after which we have only to see that these *simple sentences* are properly combined to form the most extended *compound* or *complex sentence*.

The process is not the less worth while because it is simple. The very perfection of our best systems of efficiency is their simplicity. No manager would recommend his system as admirable because it was complicated. English grammar is the systematic ordering of English words for expression of thought, and the proper knowledge of that system is the best aid to clearness, force, and beauty in the expression of thought.

JAMES C. FERNALD,  
Editor, 'The Students' Standard Dictionary.'

**GRAMMAR SCHOOLS.** The term grammar school is generally used at the present time to denote a school maintaining a full elementary or preacademic course and housed in a building or buildings by itself separate from the high

school or academic department. Less frequently a school having only the seventh and eighth grades is called a grammar school. The term is usually not employed except in a city or large village.

The course of study in a grammar school is essentially the same as that commonly prescribed in the rural school or the elementary department of the village high school which usually includes both elementary and academic departments. The difference is in the number of studies offered, the length of time given to class periods, and, in rural schools, the number of classes or grades instructed by a single teacher.

The subjects usually taught in the grammar school are reading, arithmetic, elementary English (including composition, oral and written, grammar and literature), geography, elementary United States history, physiology and hygiene, drawing, music, and in the more fully equipped schools, cooking, sewing and manual training. More or less physical training is also usually included in the course of study. In an occasional grammar school there are taught the beginnings of certain subjects which in the past have ordinarily been considered as belonging in the high school. These subjects are Latin, modern languages, algebra and elementary general science. Graduation from the grammar school implies adequate preparation for high school work.

The typical grammar school offers eight years or grades of work, with, in many instances, a year in the kindergarten where pupils, usually not more than six years of age, are given preliminary training before beginning the regular first year school work. An occasional grammar school has nine grades, at times using nine years to complete the work ordinarily done in eight, and more frequently including some high school work in the grammar school course.

The number of teachers varies greatly. There are seldom less than eight, one to a grade, although in small outlying schools one teacher may instruct two grades. A typical city grammar school has from 16 to 32 teachers. Each of the eight grades is divided into sections according to the number registered, and a teacher is assigned to each section. The number and arrangement of sections varies greatly to correspond to local needs. According to common practice, one or more sections of each grade does the first half of the year's work while the remaining section or sections is doing the second half. This organization makes possible a series of 16 steps rather than eight in the course, and permits closer adjustment to the needs of individual pupils.

The size of a school depends chiefly on two factors: The density of population, since little children cannot be expected to walk far to school, and the number of teachers whose work can be effectively supervised by one principal. If the number is less than about 16 it is not good economy to pay the salary required to secure the highest type of supervising principal; if it is more than 32 it will be impracticable for one man to supervise properly unless assisted by departmental supervisors. With such assistance, the number of teachers may be largely increased.

Registration in each room normally varies

from 25 to 50. The ideal registration is probably from 30 to 35.

Recent developments in school organization tend to change the number of grades in the elementary school from eight to six and to organize a so-called junior high school consisting of what has been in the past the two upper grades of the elementary school and the first year of the high school. For a full explanation of the reasons for this change see the article on the JUNIOR HIGH SCHOOL.

RANDOLPH T. CONGDON.

**GRAMME**, the standard unit of French measures of weight. A gramme=15.432 grains troy. See METRIC SYSTEM.

**GRAMOPHONE**. A sound-reproducing apparatus invented by Emile Berliner and the basis of all disc phonographs. In principle it is similar to the phonograph (q.v.) and the graphophone (q.v.), but in its original form differed from these by employing a glass disc coated with lamplack instead of a cylinder of wax for its record. This disc carries a stylus connecting with a diaphragm which is vibrated by the sound-waves, and records those vibrations upon the lamplack surface in the form of a long spiral, as the disc is revolved in a horizontal plane. Unlike the record cylinders of the phonograph or graphophone, the disc cannot be used directly to reproduce the sounds thus recorded, and for that purpose a corresponding disc of hard rubber, prepared from a metal die photo-mechanically etched from the original markings on the lamplack coating of the glass disc is employed. In its subsequent development the method of making and reproducing records has been assimilated to that for cylinder phonographs.

**GRAMPIANS, GRAMPAN HILLS**, or **GRAMPAN MOUNTAINS**. (1) The chief mountain system of Scotland, extending across the country from southwest to northeast, for a distance of about 150 miles, and roughly regarded as the dividing line between the Highlands and Lowlands. Its limits are not well defined, but it may be said to commence near the southwest end of Loch Awe, on the west coast of Argyshire, where the main ridge runs, in a well-marked course, along the northern boundaries of Perthshire to Cairn Ealer, where it separates into two distinct branches—one stretching north-northeast on the north side of the Dee, and terminating near Huntly; the other running nearly due east on the south side of that river, and terminating in the neighborhood of Stonehaven. Among its peaks are Ben Nevis, the highest mountain in Scotland, 4,406 feet; Ben Cruachan, 3,689 feet; Ben Lomond, 3,192 feet; Ben Lawers, 3,984 feet; Schiehallion, 3,547 feet; Ben Macdui, 4,296 feet; Cairngorm, 4,084 feet; Cairntoul, 4,241 feet. The more remarkable passes are those of Aberfoyle, Glenshee and Killiecrankie. The principal rivers rising in the Grampians are the Tay, Forth, Spey, Don and Dee. The range takes its name from the Graupius Mons of Tacitus, the scene of Agricola's defeat of Galgacus in 86 A.D. (the site of which is unknown) and its mistaken rendering "Grampius."

(2) A low range of mountains in the western part of Victoria, in Australia, are called Grampians.

**GRAMPUS**, or **COWFISH**, a genus of porpoises of the family *Delphinidae*. The species inhabiting the North Atlantic (*Grampus griseus*) reaches a length of about 12 feet. The head is globose, with a slight indication of a beak; the lower jaw shorter than the upper; dorsal fin high and falcate. The upper surfaces of the body are gray in color, the belly grayish white. The body is usually marked with numerous, irregular, light-colored lines which are believed to be due to the attacks of the cuttlefish. The young have the front of the head yellowish white, and six or seven vertical white lines on the sides. There are from 6 to 14 rather large, blunt teeth in the lower jaw, but none in the upper jaw. On the Atlantic coast of North America the grampus occurs singly or in small schools, ranging southward to New Jersey. It also occurs on the coasts of Europe. A closely allied species (*G. Stearnsi*) inhabits the north Pacific, and the genus has been reported from the Cape of Good Hope and New Zealand. The grampus feeds upon cuttlefish, and yields oil of superior quality. The name grampus (from the Italian *gran pesce*, meaning simply "large fish") is applied also to various other cetaceans, and especially to the killer whale (*Orcinus orca*) and to the blackfish (*Globicephala*).

**GRANADA**, Fray Luis de, Spanish writer and orator: b. Granada 1504; d. Lisbon, 31 Dec. 1538. His father died while Luis was still a child leaving the family without resources and his mother did the washing at the monastery of Santo Domingo, the inmates of which extended help to her in other ways. The boy showed an early precocity which attracted the attention of Count Tendilla, who gave him permission to study with his own children. At the age of 20 Granada joined the Dominican order and giving up his family name of Sarria, he assumed that of his native city, Granada. In the monastery which was, in those days, a sort of university, Granada followed all the courses given and outdistanced all of his fellow students. He showed special talent as an orator. Even among the brilliant students of the monastery he became so noted for his numerous talents that he was crowned with the greatest honor the institution could bestow upon him. In June 1529, after finishing his course at the monastery, he was elected honor student of his alma mater in the College of Valladolid. On the completion of a brilliant course, broad, far-reaching and deep in its significance, he returned to the monastery of Granada as a teacher of higher studies, especially philosophy and theology. In Granada he soon acquired a reputation as a preacher and orator that surpassed that already acquired as a student and teacher. Thousands of all classes flocked to hear him and among his hearers he made many influential friends who served him in good stead when he was appointed head of the dilapidated monastery of Scala Caeli in the mountains of Cordoba. In the latter Fray Luis gathered about him a body of earnest young monks zealous for the good of the Dominican order, and with their aid and that of his influential friends and the good will of the community, he succeeded in making Scala Caeli one of the most notable monastic centres of Spain. There he composed some

of his most important works. After eight years of labor there he was appointed preacher and priest to the Duke of Medina-Sidonia at his palace in Sanlúcar. This position he relinquished to undertake the task of founding a great Dominican monastery in Badajoz, in which he was brilliantly successful, due principally to his oratorical ability and his talent for organization. In this new convent he wrote 'Guia de pecadores,' a work which met with great favor not only in Spain but in all Christian countries. Scarcely had he finished his task in Badajoz when Fray Luis was invited to Portugal by the royal cardinal archbishop of Evora. So great was his success as an orator in Portugal that the Portuguese showered upon him all the favors permitted by the order; and in 1557 he was elected to the high position of provincial of Portugal, which made him head of all the Dominican monasteries and establishments in the country. At the end of his term of office during which he was very active in erecting and improving monasteries and otherwise advancing the interests of the order, Fray Luis returned to Lisbon to convent life, having refused the appointment of archbishop of Brega offered him through the queen of Portugal whose confessor he had been. He died shortly afterward of a fever contracted through mal-nutrition, the result of his ascetic life.

Fray Luis de Granada set a higher standard of Spanish prose than any of his contemporaries or predecessors. Among his published works are 'Guia de pecadores'; 'Libro de la oración y meditación'; 'La vida Cristiana'; 'Símbol de la Fe'; 'Doctrina Cristiana'; 'La vida del Padre Maestro Avila'; 'Vida de Milicia Fernández'; 'Vida de Dona Elvira de Mendoza'; 'Conceptus Mundi'; 'La escala espiritual de San Juan Climaco.' For works and biography see Volumes VI, VIII and XI of the *Biblioteca de autores españoles* (Ravedeña).

**GRANADA**, grā-nā'dā, (1) an ancient kingdom, subsequently a part of southern Spain, bounded by Andalusia, Murcia and the Mediterranean. It was included in the Roman province of Boetica, and after the Saracen invasion became an independent Moorish kingdom until it was conquered by Ferdinand and Isabella in 1492, when it became one of the 13 old provinces; it had an area of 11,100 square miles, and since 1833 is divided into the provinces of Granada, Almería and Málaga. (2) The modern province, with a coast line of 66 miles on the Mediterranean, has an area of 4,928 square miles. It is picturesquely diversified by mountains and valleys, the chief range being the Sierra Nevada, which attains a maximum altitude of 11,781 feet in the Cerro de Mulhacen, the loftiest summit in Spain. The province watered by the Guadalfeo, the Jenil and Darro is comparatively fertile and well cultivated; and abounds in mineral wealth. Pop. (1900) 402,460; in 1917 about 534,000. The capital is (3) Granada, the ancient metropolis of the Moors. It is romantically situated on the rivers Darro and Jenil, at the foot of the snow-capped Sierra Nevada, which forms a background to the crescent-shaped city, with its terraced streets, turrets and gilded cupolas rising above each other, the whole crowned by

the Alhambra (q.v.), the famous citadel-palace of the Moorish rulers. After the Moors had been forced to abandon the rest of their Spanish dominions they held out for 250 years in the old kingdom of Granada, and during that period were able to adorn their capital with this famous palace, which represents the highest achievement of Moorish art in Spain, just as the mosque at Córdoba stands for the Arab genius. "Though the one style proceeds out of the other," Mr. Royall Tyler writes, "and the superficial resemblances are many, the real differences go very deep. If nobility be the ideal, there is no doubt as to which is the greater; and nature has done well to enhance Granada's charms by the wonderful setting furnished by the Sierra Nevada, for otherwise the struggle would have been too unequal. As it is, the Alhambra will remain for most people the culminating glory of all Spain." The gardens of the Alhambra are surpassed by those of the Generalife, a delightful place on a neighboring hill. The city itself contains very few vestiges of Moslem times, but has a lovely Renaissance cathedral, by Diego de Siloe, which possesses much good sculpture by Alonso Cano and others. Adjoining it is the Capilla Real, which shelters the tombs of Ferdinand and Isabella. The Granadine school of painters and sculptors in the 16th and 17th centuries included, beside Alonso Cano who has been mentioned above, Pedro de Mena, José de Mora and Atanasio Bocanegra, whose work may be studied not only in the cathedral but also in the churches of San Juan de Dios, San Jeronimo and the Cartuja. Other noteworthy buildings are the archiepiscopal palace and the residence of the provincial captain-general. Granada is the seat of a university founded in 1531, of several colleges, a normal school and a school of art. It has various manufactures of local importance only, such as silks and woolsens, leather, paper, hats, etc. Founded by the Moors before 800, near the site of the ancient Illiberis, and from 1036 to 1234 included in the kingdom of Córdoba, in 1235 it became the capital of a new kingdom, and attained almost matchless splendor. In 1491 it remained the last stronghold of the Moors in Spain, and mustered 60,000 men to resist Ferdinand and Isabella. The defense proved unavailing and the besiegers took possession in 1492. A year later it was made the seat of an archbishopric. The great body of its inhabitants still were Moors, and its prosperity continued almost without diminution till 1610, when it declined with the decree expelling the Moors from Spain. Pop. about 78,000.

**GRANADA**, Nicaragua. (1) City, capital of the department of Granada, on Lake Nicaragua and the Pacific Railroad of Nicaragua. It was founded in 1524 and was formerly the chief town of the republic, but has suffered greatly from the civil wars. It is a trading centre for dyewoods, cacao, gold and silver filigree hand-made ornaments and hides. Pop. 17,002. (2) The department of Granada lies between the Pacific and Lakes Nicaragua and Managua; area about 2,600 square miles; highest peak, Mount Mombacho, an extinct volcano.

**GRANADILLA**, the edible fruit of certain tropical species of passion-flowers (q.v.).

**GRANARY**, The, an ancient burial ground in Boston, Mass., in Tremont street. Here are buried Paul Revere, Samuel Adams, John Hancock, Peter Faneuil, Chief Justice Sewall and several of the old colonial governors of Massachusetts.

**GRANBERRY**, John Cowper, bishop of the Methodist Episcopal Church South: b. Norfolk, Va., 5 Dec. 1829; d. Ashland, Va., 1 April 1907. Graduated Randolph-Macon College in 1848, he entered the Methodist ministry in that year, was a chaplain in the Confederate army in 1861-65 and in 1875-82 professor of moral philosophy and practical theology in Vanderbilt University. His publications include 'Twelve Sermons' (1896) and 'Experience the Crowning Evidence of the Christian Religion' (1900).

**GRANBURY**, Tex., town, county-seat of Hood County, on the Brazos River, the Fort Worth and Rio Grande Railroad. The chief manufactures are flour and farm implements. It has a cotton-gin, oil mill, ice plant and is a trade centre for the products of the surrounding agricultural region. Pop. 1,336.

**GRANBY**, Canada, town on the Yamaska River in Shefford County in the province of Quebec, on the Central Vermont Railway, 55 miles southeast of Montreal and also on the Montreal and Southern Counties Electric Railway. There are rubber, comb, sash and door and chair factories, and carriage works. Pop. 4,750.

**GRANBY TOKEN** (1737), a private copper coinage issued by John Higley of Granby, Conn., where there were copper mines afterward used as Tory prisons and workshops. The obverse was a deer, with the legend 'Value Me as You Please'; Roman numerals III and crescent. The reverse was three hammers on a triangular field, each surmounted by a crown, and with the legend 'I Am Good Copper.'

**GRAND**, Sarah, pseudonym of FRANCES ELIZABETH CLARKE, English novelist: b. Ireland. When 16 she married Lieutenant-Colonel M'Fall (d. 1898), with whom she traveled in India, China and Japan; in 1901 she visited the United States. She has been active in the woman's movement in England. The first novel that gave her reputation was 'The Heavenly Twins' (1893). Her other writings include 'Singularly Deluded'; 'A Domestic Experience'; 'Our Manifold Nature' (1894); 'The Beth Book' (1897); 'The Modern Man and Maid' (1898); 'Bals the Impossible' (1900); 'Emotional Moments' (1908); 'Adam's Orchard' (1912); 'The Winged Victory' (1916).

**GRAND ARMY OF THE REPUBLIC**, a patriotic association, organized in the interest of the surviving representatives of the military and naval forces of the Civil War, the families of those dead, and such objects as they think cognate with these. The membership is of soldiers and sailors of the war, honorably discharged or continuing, and State militia on active duty subject to national call during that time. It was organized in Illinois in the winter of 1865-66, by Dr. B. F. Stephenson and Rev. W. J. Rudolph, the surgeon and the chaplain of the 14th Illinois Infantry; the

first post was organized at Decatur, Ill., 6 April 1866; the first national "encampment" was held at Indianapolis, 20 Nov. 1866. Its assigned objects are fraternity, commemoration and assistance among the above classes; and it has aided in establishing soldiers' homes and memorials, and maintaining and educating soldiers' orphans. It also caused the institution of Memorial Day. It ruled in 1869 that it should not be used for partisan work, nominations or debates, but naturally it has been a powerful factor in political calculations and the shaping of party conduct regarding both nomination of candidates for office and legislative action. It has also given out strong utterances against restraining liberality in pension legislation, and has used its influence to prevent official restriction in the expenditure of money under such legislation. It has headquarters in Cincinnati, and in 1916 reported 5,452 posts throughout the country, almost every State being a department with a commander. The membership was 159,863; it was once over 400,000. The deaths, during the year ended 31 Dec. 1914, were 11,434. There is a national council of administration of 44 members. It holds annual meetings or encampments in the chief cities; the uniform is dark blue with black slouch hat. Its badge is a bronze star hung from a strap and ribbon flag; on the star in relief are a soldier and sailor clasping hands in front of a figure of liberty, with two freemen in the foreground, the United States flag on the sides. Consult Beath, R. B., 'History of the Grand Army of the Republic' (New York 1889) and Wilson, O. M., 'The Grand Army of the Republic under its First Constitution and Ritual' (Kansas City, Mo., 1905). See WOMAN'S RELIEF CORPS.

**GRAND CANYON**, Ariz., also called the grand canyon of the Colorado River in Arizona to distinguish it from the grand canyon of the Yellowstone (see YELLOWSTONE NATIONAL PARK), from the profound gorges cut by the Green and Grand rivers, from Marble Canyon, etc. It was set aside 11 Jan. 1908 as one of the "national monuments" administered by the Agricultural Department; the area of the reservation is 806,400 acres; the gorge is 217½ miles in length, 4,000 to 6,000 feet deep, and in width at the top varies between one or two miles and quite 15 miles. If we include the Marble Canyon, its less profound neighbor, the chasm's total length is increased to 283 miles. A publication of the Department of the Interior contains an excellent account of Major Powell's famous adventure which culminated here. For hundreds of miles the Colorado and its tributaries form a mighty network of mighty chasms which few had ventured even to enter. Of the Grand Canyon, deepest and hugest of all, tales were current of whirlpools, of hundreds of miles of underground passage and of giant falls. The Indians feared it. Even the hardest of frontiersmen refused it. It remained for a geologist and a school teacher, a one-armed veteran of the Civil War, John Wesley Powell, to dare and to accomplish. That was in 1869. Nine men accompanied him in four boats. There proved to be no impassable whirlpools in the Grand Canyon, no underground passages and no cataracts.

But the trip was hazardous in the extreme. The adventurers faced the unknown at every bend, daily embarking upon swift rapids without guessing in what great falls such rapids might terminate. Four men deserted, hoping to climb the walls, and were never heard from again—and this happened the very day before Major Powell and his faithful half dozen floated clear of the Grand Canyon into safety. Charles Dudley Warner called the chasm "by far the most sublime of all earthly spectacles." Professor Van Dyke wrote: "More mysterious in its depth than the Himalayas in their height, the Grand Canyon remains not the eighth but the first wonder of the world." To geologists it seems primarily a masterpiece of erosion. See NATIONAL PARKS AND MONUMENTS.

**GRAND CANYON OF COLORADO RIVER.** In crossing the high plateau region of southern Utah and northern Arizona, the Colorado River has cut the greatest canyon in the world. It is more than a mile deep in places and the deeper portion is about 200 miles long. It is not only the most notable scenic spectacle of its kind, but a remarkably clear and impressive exposition of geology, presenting many features that can be readily understood. The rocks are bare, and while most of them are in thick beds lying nearly level some are tilted at various angles. They represent a long portion of geologic time from the Archæan, or oldest known, to the late Carboniferous, but deposits of Ordovician, Silurian and most of the Devonian ages are absent. These rocks constitute cliffs and buttes of great variety of form and much brilliancy of color, forming a most stupendous and beautiful spectacle. The features presented illustrate most clearly the titanic process of nature's sculpturing, not only in the present configuration but in the former land surfaces of earlier geologic times.

The term Grand Canyon is applied to that portion of the canyon of the Colorado River which lies in northern Arizona. It is in the midst of a wilderness and inaccessible from most directions, but the Atchison, Topeka and Santa Fe Railroad has a branch line to its southern rim at a locality where some of the finest features are visible. Here are hotels from which trips can be made along the rim and down trails to the river's edge. Some views in this vicinity are given in the plates herewith. The altitude here is 6,866 feet above sea-level; at the river just north it is 2,355 feet; on the farther rim to the north it is 8,000 feet.

Few persons can realize on first view that the canyon is nearly a mile deep and from 8 to 10 miles wide. The cliffs descending from the rim form a succession of huge steps, each 300 to 500 feet high, with steep rocky slopes between. These cliffs are the edges of hard beds of limestone or sandstone, while the intervening slopes mark the outcrops of softer shales. These beds are more than 3,500 feet thick and they lie nearly horizontal. Far down in the canyon is a broad shelf caused by a basal hard sandstone; it is deeply entrenched by the narrow inner canyon cut a thousand feet or more into the underlying Archæan "granite."

The rocks of the canyon walls vary in color from white and buff to bright red and dull green. They present a marvelous variety of

picturesque forms fashioned mainly from erosion by running water, the agent which has excavated the canyon.

The Colorado River, one of the largest in North America, rises in the Rocky Mountains in Colorado and Wyoming and empties into the Gulf of California. In the Grand Canyon it is about 300 feet wide and 30 feet deep, flowing about 2 miles an hour with an average volume of 20,000 cubic feet a second. During freshets the depth, velocity and volume are greatly increased. In its course of 42 miles through the central or deeper part of the canyon the river falls about 500 feet or 12 feet to the mile. The water contains much sediment, especially in time of flood. Every rain fills the side canyons with rushing torrents which carry into the river a heavy load of debris from the adjoining slopes. Thus has the canyon been excavated and the deepening and widening is still progressing. It began at the surface of the plateau and it will continue until the river reaches a grade so low that it can no longer move the debris; meanwhile the side streams will widen the canyon until its sides become gentle slopes. Under present conditions and without further uplift of the country this will require a million years or more.

The rocks exposed in the walls of the Grand Canyon underlie a wide area of the Arizona Plateau and most of them extend far beyond. The first 3,700 feet of beds, all of which lie nearly horizontal, are as follows:

LIST OF STRATA FROM RIM TO GRANITE, ETC., IN WALLS OF GRAND CANYON.

	Feet
Carboniferous { Limestone, light colored, partly cherty, mostly massive (Kaibab).....	800
{ Sandstone, light gray, massive, cross-bedded, (Coconino).....	300
{ Sandstones and shales, all red (Supai formation).....	1,100
Carboniferous { Limestone, massive, light blue-gray, but surface mostly stained red (Redwall).....	550
{ Shale, with limestone and sandstone layers.....	
{ Sandstone, hard, dirty gray to buff (on granite).....	150
{ Tonto group.....	800

These formations are readily recognized by their color or character as they are practically uniform in aspect and relative position from all points of view.

The relations of these rocks are shown in the views and in the following cross sections: Fig. A.—Section across Grand Canyon from El Tovar Hotel through Buddha Temple to Kaibab Plateau. Fig. B.—Section across Grand Canyon near El Tovar, looking west.

The top limestone, Kaibab, caps the plateaus on both sides and the highest buttes. The outcropping edge of the Coconino sandstone is marked by a distinct band of light gray all along the canyon walls and capping some buttes 700 to 800 feet below the top. The red beds of the Supai formation everywhere constitute the middle slopes and many buttes, usually presenting a series of relatively small terrace-like steps. The conspicuous cliff below these, and stained red by their wash, is the hard massive Redwall limestone. It projects in many flat-topped spurs, buttresses and outliers isolated by erosion. The Tonto group, next below, forming slopes and a platform, is recognized by its greenish color.

For many miles the shelf of this sandstone of the Tonto group is cut through by a steep

inner gorge which descends to the river 800 to 1,000 feet below, and exposes granite and gneiss of the original earth crust. At certain localities Algonkian rocks lie between the Tonto and the granite and they occupy a wide area northeast of Grandview. They consist of 42,000 feet of limestone, sandstone, red shale and lava, known as Unkar and Chuar group. These beds dip at moderate angles and on their irregular surface, which was land in earlier Cambrian time, lies the shale of the Tonto Group.

The first white men to see the Grand Canyon were Cardenas and his 12 companions, who were guided to the rim by Hopi Indians in 1541. Nearly 330 years later the first trip ever made down the river was accomplished by Maj. J. W. Powell. He left Green River, Wyo., 24 May 1869, in small boats and had a perilous and exciting but entirely successful passage. A memorial to Major Powell has been erected by the government on the rim at Sentinel Point. Since his pioneer effort this hazardous journey has been made by a few others, among them a party surveying for a proposed railroad, a proj-

**GRAND FALLS, or COLEBROOKE,** Canada, port of entry, in Victoria County in New Brunswick, on the Canadian Pacific and Grand Trunk Pacific railways, 202 miles from Saint John. It is on the Saint John River, which is navigable to this point. The falls, which give the name to the place, are about 80 feet in height. Considerable trade is carried on in agricultural products. It is a tourist and sporting centre. Pop. 1,280.

**GRAND FALLS,** a cataract of the Grand River, in Labrador, British America. These falls are in a canyon of the Grand River, 25 miles long and nearly 500 feet deep. About four miles above the falls the river begins a rapid descent of 200 feet to the falls, where the precipice is 320 feet deep and 200 feet wide. Below the falls is another rapid descent of about 300 feet, and then a gradual descent to the ocean. The total descent from the beginning of the first above the falls to the ocean is about 2,000 feet. This canyon was discovered in 1839 by a Hudson Bay Company official named McLean; but no further report being made, its

Sections across Grand Canyon of Colorado River near El Tovar Looking West.

ect since abandoned. The Grand Canyon is included in a forest reserve and has also been created a national monument administered by the United States Department of Agriculture.

**Bibliography.**—For further descriptions and details the reader is referred to the following books: Darton, N. H., 'Guidebook of Western United States' (Santa Fe Route, Bulletin 613, United States Geological Survey) and 'Story of the Grand Canyon of Arizona'; Dellenbaugh, F. S., 'Romance of the Colorado River' (1902) and 'A Canyon Voyage' (Narrative of the second Powell expedition, 1908); Kolb Brothers, 'The Grand Canyon of Arizona' (1913); Powell, J. W., 'Exploration of Colorado River of the West' (Explorations in 1869-72, under Smithsonian Institution, Washington 1875) and 'Canyon of the Colorado' (1895); Wharton, James S., 'In and Around the Grand Canyon of Arizona' (1900) and 'The Grand Canyon of Arizona, How to See It' (1912).

N. H. DARTON,  
Geologist, United States Geological Survey.

existence became a memory until 1891, when it was rediscovered and in 1894 surveyed by the Canadian Geological Survey. See **GRAND RIVER**.

**GRAND FORKS, N. D.,** city, county-seat of Grand Forks County, on the Red River of the North and the Red Lake River, and on the Northern Pacific and the Great Northern railroads, about 25 miles west of Crookston and 320 miles northwest of Saint Paul. It was settled in 1871 and incorporated in 1881. It is situated in an agricultural, cattle and hog-raising and dairying region. Its chief manufactures are meats and packing-house products, flour, sash and doors, candies, creamery products, foundry products, bricks and steam-boilers. The United States census of manufactures for 1914 showed within the city limits 32 industrial establishments of factory grade, employing 462 persons; 343 being wage-earners receiving annually \$288,000 in wages. The capital invested aggregated \$1,346,000, and the year's output was valued at \$1,816,000; of this, \$819,000 was the value added by manufacture. In addition to

the trade in its manufactured articles it has a large trade in live stock, wheat, oats and potatoes. The city has five banks with an aggregate capital and surplus of \$800,000. It is the seat of the North Dakota State University, opened in 1884, the Wesley College of Music, Saint Bernard's Academy and the Grand Forks School of Music. Two large business universities are located here also. The public school system is excellent and progressive. Saint Michael's Hospital, the city building, the government building, the Y. M. C. A. building, Saint Michael's Catholic Church, the public library and the Presbyterian Church are among the principal buildings of the city. The city owns the electric-light plant for street lighting and the waterworks. In the last decade Grand Forks increased in population over 50 per cent. Pop. 15,000; including East Grand Forks, Minn. (directly across Red River), 17,426.

**GRAND HAVEN**, Mich., a port of entry, county-seat of Ottawa County, on Lake Michigan, at the mouth of Grand River, and on the Grand Trunk, Pere Marquette and Grand River, Grand Haven and Milwaukee railroads. It has an excellent harbor open the year around with steamship connections to Chicago and Milwaukee. The Grand Trunk operates two car ferries between Grand Haven and Milwaukee. A big trade is carried on in machinery, leather, fruits and grains. The principal manufactured products are automobile leather, steam engines and hoists, refrigerators, pianos, brass and iron castings, stampings, files and rasps, steel boilers and vessels. Large quantities of smoked fish, berries, grapes and celery are produced. The city was founded in 1835; it has three popular summer resorts, Highland Park, Spring Lake and Grand River. The form of city government is a modified commission plan with a mayor and city manager. It has municipal waterworks, electric plant, a public library, fine parks, electric railroad and radiating system of good roads. Fine high school and Akeley College for girls. Pop. 8,000.

**GRAND ISLAND**, Neb., county-seat of Hall County near the Platte River, on the Burlington & M., the Union P., the Saint J. & G. I. railroads, about 97 miles west of Lincoln and 144 miles southwest of Omaha. The first permanent settlement was made in 1862, and it was incorporated in 1872. It is situated in a fertile agricultural region. The chief manufactures are beet sugar, flour, canned fruits and vegetables, machinery, brooms, mattresses, fencing materials and chemicals. The United States census of manufactures for 1914 showed within the city limits 49 industrial establishments of factory grade, employing 608 persons; 460 being wage-earners receiving annually a total of \$342,000 in wages. The capital invested aggregated \$1,750,000, and the year's output was valued at \$2,101,000; of this, \$685,000 was the value added by manufacture. Large railroad shops for the Union Pacific Railroad are located here. There is an extensive trade in live stock and grain. The city is one of the largest horse and mule markets in the world, the sales annually amounting to about 40,000 head. Grand Island contains a number of wholesale establishments and is the distributing centre for a large section of the northwest of Nebraska. The State Soldiers' and Sailors' Home and

Saint Francis' Hospital are located here. It is the seat of Grand Island College, opened in 1892 under the auspices of the Baptist Church, and it has a large free library. The present city charter, of 1901, provides for the election of a mayor every two years and a city council, in whom is vested the government. The city owns the waterworks and light plant. Pop. 11,505.

**GRAND JUNCTION**, Colo., city, county-seat of Mesa County, at the junction of the Grand and Gunnison rivers, and an important point on the Denver and Rio Grande and the Colorado Midland railroads. It is 4,560 feet above sea-level. It is nearly midway between Denver and Salt Lake. It is situated in a very fertile tract known as Grand Valley, and fruit, vegetables, alfalfa, beets and grain are raised in abundance. There are also a number of manufacturing industries, including a beet-sugar factory, flour mill, canning factory and meat packing factories, and there is a thriving trade in coal, lumber and bricks; a Carnegie library and Saint Mary's Hospital and a Y. M. C. A. and post-office. There are several fine parks. The city is surrounded by some of the most noted scenic points in Colorado. The waterworks are owned and operated by the municipality. Pop. 10,000.

**GRAND JURY**. See **JURY**.

**GRAND LAKE**, La., one of the shallow bodies of water in the southern part of the State, about 50 miles long. Its maximum width is about nine miles. Its chief inlets are Atchafalaya and Grand rivers, and Lake Vermet. Its outlet is Myrtle Bayou, which flows into Atchafalaya Bay, an arm of the Gulf of Mexico.

**GRAND MANAN**, mā-nān', an island at the entrance of the Bay of Fundy, off the coast of Maine. It belongs to Charlotte County, in New Brunswick, Canada; area, 36,552 acres. On the north coast, at Indian Beach, is a settlement of Indians. Fishing is the chief occupation, but the large forests still furnish material for ship-building and some lumber. The island is a favorite summer resort, because of its climate and the abundance of small game. Pop. 2,644.

**GRAND MÈRE**, grān mār, Canada, town in Champlain County, province of Quebec, on the north side of the Saint Maurice River, 21 miles north of Three Rivers, on the Canadian Pacific and Canadian Northern railways. It is situated in a good farming district with excellent water-power facilities. Pulp and paper mills, sash and door factories, stove manufacture and bookmaking are the industries. Pop. 4,783.

**GRAND OLD MAN**, The, a name popularly applied to W. E. Gladstone (q.v.).

**GRAND PRIX DE ROME**, grān prē dê rôm, prize given annually by the Academy of Fine Arts in Paris to the most successful competitor in painting, music, sculpture, architecture, etc. The winners of the prize become the charge of the government for four years and are sent to Rome to reside at the Villa Medici, the seat of the Académie de France à Rome. Each prizeman receives about \$800 for his expenses, and is exempted from military service. The Prix de Rome was instituted by

Louis XIV in 1666 for the purpose of educating young painters and sculptors by a study of the Roman antiquities. Architects were admitted to competition in 1720. The institution was suspended for a time during the Revolutionary period, but was opened again in 1803 by Napoleon who enlarged it to admit musicians, medalists, engravers. During the Napoleonic régime the school was removed to the Villa Médici. Consult Baltard, *'La Villa Médicis à Rome'* (Paris 1847). See *ÉCOLE DES BEAUX ARTS*.

**GRAND RAPIDS, Mich.,** city and county-seat of Kent County, second in State to Detroit in population and importance, is situated on both sides of Grand River, about 35 miles by rail from Lake Michigan, 152 miles from Detroit, 180 miles from Chicago; lat. 42° 57' 49.02" N., long. 85° 40' 1.65" W. Area 18.25 square miles.

**Railroads.**—The first railroad into Grand Rapids was the Detroit and Milwaukee (now a part of the Grand Trunk system), from Detroit to Grand Haven, in 1858. Since then have been built the Grand Rapids and Indiana, the Michigan Central, the Lake Shore, the Pere Marquette and three interurban lines. These roads radiate in 11 different directions, with through trains to all important Michigan cities and New York, Chicago, Cincinnati and Toledo. The Grand Rapids and Indiana and the Pere Marquette have extensive shops.

**Industries.**—Grand Rapids is the base of supplies and the distributing point for western and northern Michigan. It has large wholesale and jobbing houses in groceries, provisions, clothing, dry goods, millinery, carpets, crockery, drugs, paper, cigars, boots and shoes, knit goods, sporting goods, hardware, mill supplies and in other lines. The chief industry is the manufacture of furniture (see *FURNITURE INDUSTRY*). New York and Chicago in their order exceed Grand Rapids in the volume of their furniture production, but Grand Rapids is regarded as a leader in design, finish and quality. Semi-annually, in January for the spring season, and July for the fall, buyers come here from all parts of the United States and from foreign lands to inspect the new styles and to place orders. Between 300 and 400 manufacturers of furniture and kindred lines in other parts of the country semi-annually send their samples here for the buyers to inspect. The outside manufacturers occupy large furniture exposition buildings built for their use, in the heart of the city. Other important industries are the manufacture of plaster from gypsum beds under and near Grand River, knitting mills and textile industries, brass works, printing, manufacture of flour, machinery, carpet sweepers, etc.

**Fruit-growing.**—Grand Rapids is also the centre of the West Michigan fruit belt, which extends along Lake Michigan from Saint Joseph to Traverse City. With an average crop, the peaches, apples, pears and plums marketed here will exceed 1,300,000 bushels. This is also an important winter lettuce centre, Chicago, Cincinnati, Saint Louis and even New York drawing on the Grand Rapids growers for their supplies. One of the most popular varieties of winter lettuce originated here and is named the "Grand Rapids."

**Banks.**—The capital and surplus of banks

and trust companies, September 1916, \$6,935,000; capital, surplus and profits, \$7,982,575; savings deposits amounted to \$22,175,302; bank loans and investments, \$40,785,479; total bank deposits, \$42,389,693; bank clearings in 1915 amounted to \$175,419,457.

**Churches, Schools, etc.**—Many Christian Church denominations are represented with congregations and churches. The bishops of the Grand Rapids Catholic diocese and West Michigan Protestant Episcopal diocese live here. The Catholics have a cathedral. The total value of church property is estimated at \$3,620,500; the Catholics hold \$1,217,500; Reformed Church in America, \$223,500; Christian Reformed, \$233,500; Methodist Episcopal, \$218,100; Lutheran, \$195,750; Presbyterian, \$138,200; Congregational, \$159,100; Baptist, \$259,400; Protestant Episcopal, \$207,350; there are also other and smaller denominations whose property is valued at \$385,300. There are 37 public schools, including three high schools. Calvin College and Theological Seminary of the Christian Reformed Church is located here. The Catholics, Lutherans and Reformed churches have parochial schools accommodating about 8,000 pupils. The total school census in 1916 was 32,100. The Grand Rapids Public Library contained 167,028 volumes in 1916. It consists of the Ryerson library building (a gift to the city of his birth by Martin A. Ryerson of Chicago), and 41 branches and stations for circulating books. It is controlled by an elective board of five members. The museum, controlled by the same board, administers property valued at \$76,000 and is especially strong in natural history specimens.

**Public Institutions.**—The Michigan Soldiers' Home, maintained by the State with accommodations for 1,000 veterans and 200 widows, is located three miles north of the city. There are three large hospitals, two orphan asylums and two homes for the aged.

**Public Buildings.**—The public buildings are city hall, valued at \$452,000; courthouse, \$300,000; Federal building and post-office, \$700,000; county jail, \$50,000; Ryerson library building, \$506,000; museum, \$76,000; police headquarters, \$138,000.

**Clubs and Societies.**—The Peninsular Club owns a clubhouse in the heart of the city valued with real estate at \$200,000. The Owashanong Club has a clubhouse at Reed's Lake costing \$60,000. The G. R. Boat and Canoe Club owns a clubhouse on Grand Rapids River at North Park valued at \$25,000. The Kent Country Club owns 100 acres of land and a \$15,000 clubhouse and the Highland Golf Club also own land north of the city. There is an Elks temple valued at \$200,000; a Masonic temple at \$500,000; Knights of Columbus building, \$125,000 and the Loyal Order of Moose building, \$30,000; the Germans have four clubhouses and halls; the Irish, the Danish and the Polish each one. The Ladies' Literary Club and the Grand Rapids Woman's Club, the West Side Ladies' Literary Club and the Saint Cecilia (musical) Society, all made up exclusively of women, own clubhouses. The Young Men's Christian Association owns and occupies a building that cost \$250,000. The Grand Rapids Association of Commerce has 1,400 members.

**Parks and Resorts.**—The city has John Ball Park of 137 acres, the original 40 acres being

the gift of John Ball; the Antoine Campau park of four acres, the gift of Martin A. Ryerson; Highland Park, 34 acres; Lincoln Park, 15 acres; Fulton Street Park and 25 other small parks, playgrounds and squares making a total of about 400 acres. Comstock Park of 100 acres, north of the city, is owned by the West Michigan Fair Association. Reed's Lake, three miles east of the city, and North Park, near the Soldiers' Home, are popular nearby summer resorts. The Lake Michigan resorts at Saugatuck, Holland, Grand Haven and Muskegon are one hour away by rail.

**Public Utility.**—The city owns its own waterworks, with Grand River as a source of supply; a filtration plant, ensuring an abundant supply of pure water and 229 miles of mains of all sizes; it also owns its own electric-lighting plant (furnishing light for some of the city buildings, city hall, library and schools), garbage burner and market. Seven bridges owned by the city span the river, two being of concrete construction and four of steel. Commercial lighting is furnished by the Grand Rapids Gas Light Company and the Consumers Power Company (electric), each company having a monopoly in its field.

**Government.**—Municipal affairs are conducted by a mayor, elected for a term of two years, and a council of 24 aldermen, two from each ward elected for two-year terms, half retiring each year. The fire and police departments, the health, the poor and the public works and parks are under the control of boards appointed by the mayor. The schools are under a board of nine members elected by the people, and the library and museum under a board of five members, also elected. The assessed valuation in 1916 was \$163,726,341. On 29 Aug. 1916 the electorate approved a new city charter which provides for a commission-manager form of government, with seven commissioners, two elected from each of three districts by the city at large, and one chosen from the city at large. The city commission selects a city manager, who appoints a director of public service, a director of public safety and a director of public welfare. The city manager, with these three directors, exercise all of the administrative functions of the city, subject to the supervision and regulation of the city commission. The commission selects one of its members as mayor. This charter became effective the first Monday in May 1917.

**History.**—In 1826 Louis Campau established an Indian trading station here and in 1831, after the government survey, made the first entry of land. The first permanent settlement was made in 1833 by the Dexter Colony, of about 60 persons, which came from Herkimer County, N. Y. Grand Rapids was incorporated as a village in 1838 and as a city in 1850.

**Population.**—The Federal census of 1910 gave 112,571 which made Grand Rapids the 44th city in the United States. Estimated population 130,000 in 1917.

JAMES SCHRIVER,  
*City Clerk, Grand Rapids.*

**GRAND RAPIDS, Wis.,** a city and the county-seat of Wood County, on the Wisconsin River, the Chicago, Milwaukee and Saint Paul, the Chicago and Northwestern and other railroads, about 70 miles northwest of Oshkosh.

The river is spanned by a fine bridge connecting with Centralia, a suburban municipality prior to 1900, when it was incorporated with Grand Rapids. It contains a public library, a hospital and several parks. Lumbering and agriculture are the chief occupations of the inhabitants and there are lumber, pulp, paper and flour mills, manufactures of furniture, boxes, wagons, ice machines, foundries and machine shops. In the neighborhood are deposits of kaolin. There is abundant water power. The Citizens' Co-operative Society owns and operates the waterworks, telephone, electric lighting and street railway systems. Pop. 6,521.

**GRAND RAPIDS AND INDIANA RAILWAY COMPANY.** This company, fifth in succession, owning a completed line of railroad starting at Fort Wayne, Ind., running thence northerly through the city of Grand Rapids and the western section of Michigan to the Straits of Mackinac, 366.51 miles main line, with spurs and branches in Michigan, aggregating 52.52, a total of 419.03 miles, had its inception first in January 1854, at Hartford, Ind., where a company known as Grand Rapids and Indiana Company No. 1 was formed with the idea of building a railroad from Louisville, Ky., to the Michigan pineries, but accomplished nothing more than locating a line from Hartford to the northern State line of Indiana, and also as far as Sturgis, Mich.

In May 1855 the Grand Rapids and Southern Railroad Company was organized in Michigan by the same interests to build a railroad from Grand Rapids to the Indiana State line, and consolidated with the first company in September 1855, forming Grand Rapids and Indiana Company No. 2. Upon this company the State of Michigan, by an act of 14 Feb. 1857, conferred the lands granted to the State by an Act of Congress 3 June 1856, to aid in the construction of a railroad from Grand Rapids to some point on Little Traverse Bay.

In June 1857 the Grand Rapids and Mackinaw Railroad Company and the Grand Rapids and Fort Wayne Railroad Company were created and consolidated, forming Grand Rapids and Indiana Company No. 3.

The first 13 years of the life of this enterprise is replete with failures to construct any portion of its line between Fort Wayne and Grand Rapids. With the aid derived from the bonds voted by the cities of Fort Wayne and Grand Rapids it finally completed in December 1867 the first 20 miles of road from Grand Rapids north to Cedar Springs. As early as 1860 and 1861 the company had made two mortgages, the first to secure \$5,000,000 and the second \$4,500,000.

On 30 Sept. 1869 a contract was entered into by the Pennsylvania Railroad Company, lessee of the Pittsburgh, Fort Wayne and Chicago Railway, the Continental Improvement Company and the Grand Rapids and Indiana Railroad Company, for an issue of \$8,000,000 7 per cent bonds, secured upon the lands and road, running 30 years from 1 Oct. 1869—\$4,000,000 of which were guaranteed by the Pittsburgh, Fort Wayne and Chicago Railway Company and \$4,000,000 unguaranteed. With part of the proceeds of these bonds and the proceeds of \$3,000,000 of debenture bonds, the

Continental Improvement Company completed the road from Fort Wayne to Petoskey (Little Traverse Bay) in November 1873. The cost of road and equipment as per settlement contract was \$10,848,250.

In June 1871 the Grand Rapids and Indiana Railroad Company took a lease for 99 years of the Cincinnati, Richmond and Fort Wayne Railroad, then building, and which was completed in December 1871, from Richmond, Ind., to Adams (five miles east of Fort Wayne), 86 miles, to be used as an outlet south of Fort Wayne for the traffic of the Grand Rapids and Indiana Railroad.

The Continental Improvement Company, under a contract with the Traverse City Railroad Company, dated December 1871, completed the Traverse City Railroad from Traverse City to Walton Junction, 26 miles, in December 1872, and this road was leased to the Grand Rapids and Indiana Railroad Company for 50 years from January 1883, rental being net earnings, which were guaranteed to equal annual interest on first mortgage bonds, \$250,000.

In June 1881 the Grand Rapids, Indiana and Mackinaw Railroad Company was organized in the interest of the Grand Rapids and Indiana Railroad Company for the purpose of extending its road from Bay View to Mackinaw City. This portion of the line was open for operation in July 1882. This company was consolidated with Grand Rapids and Indiana Company (No. 3) in October 1884, under the name of Grand Rapids and Indiana Company (No. 4).

The Bay View, Little Traverse and Mackinaw Railroad Company, line from Bay View to Harbor Springs, Mich., six miles, completed its road in 1882; was sold under foreclosure proceedings in February 1888, and purchased at sale by the Grand Rapids and Indiana Railroad Company, which owned all its stock and bonds.

The Muskegon, Grand Rapids and Indiana Railroad Company was organized in the interest of the Grand Rapids and Indiana Railroad Company in February 1886. The road was completed from Muskegon to Grand Rapids, 37 miles, in December 1886, and leased to the Grand Rapids and Indiana Railroad Company for 99 years from time of its completion, June 1886, rental being net earnings, which were guaranteed by the lessee to be equal to the fixed charges (interest on \$750,000 5 per cent bonds), and 20 per cent of gross earnings of all business interchanged; but the excess of expenditure over earnings forced the sale of the Grand Rapids and Indiana Railroad under foreclosure 10 June 1896.

A new company was organized as the Grand Rapids and Indiana Railway Company, was incorporated in Indiana and Michigan in July 1896, and commenced operation of the road 1 Aug. 1896, with a capital stock of \$6,000,000. Of this, \$4,291,000 was exchanged for third mortgage 5 per cent bonds, and \$1,500,700 for debts, and also provided for a second mortgage of \$5,000,000 (2 per cent first year, 3 per cent two years and 4 per cent thereafter), of which \$3,962,000 were exchanged for second mortgage bonds and certain debts of the old company; the remainder held in treasury for necessary betterments to the property in its then depleted condition.

By economical management and wise ex-

penditures for betterments and additions, the company was enabled to make a slight return in the shape of dividends to its shareholders, first in 1900, beginning with 1 per cent and now paying 3 per cent; but is confronted by such hostile legislation in Michigan, both in the reduction of its passenger fares and increased taxation to such an extent that it is a serious question whether it can continue the small return to those who furnished the capital, so long in advance of its needs, to develop western Michigan and northern Indiana. Dividend of 3 per cent was continued until April 1910, since when no dividends have been paid.

**GRAND REMONSTRANCE**, a document of protest against misgovernment, drawn up by the House of Commons on 22 Nov. 1641 and presented to Charles I of England on 1 Dec. 1641. The causes leading up to this written protest were many, and its passage, by a majority of 11, by the House after a long, stormy debate, was undoubtedly hastened by the outbreak of rebellion in Ireland, and also the absence of the king, who at the time was in Scotland. The Puritan leaders had become disgusted with the intrigues carried on by the king with the Earl of Montrose, and in this document the grievances were set forth in such a manner that they were in fact an indictment of the whole governmental policy of the king. The imprisonment of members of Parliament without cause, the billeting of soldiers, the high-handed methods of the Star Chamber, High Commission and the Council of the North, the excessive abuses of the commercial monopolies and the unwarranted extension of the royal forests, as well as other minor grievances, in all 204 sections, were the points discussed in the manifesto. In it were also asked the appointment of new ministers, and that to a synod of learned divines be given the task of Church reform. King Charles ridiculed the document when it was presented for his consideration; on 10 December gave an indirect reply to the criticisms contained therein in shape of a proclamation on religion; on 15 December it was published; on 23 December answered the petition in an extremely evasive manner; on 3 Jan. 1642, before the House of Lords, impeached the leaders in the Commons who were most opposed to him, and who had been most instrumental in the passage of the document; and on 4 January, attended by a body of armed men, went down in person to the House of Commons and invaded the House in an attempt to arrest five of its members. Consult Gardiner's 'Constitutional Documents' (Oxford 1889).

**GRAND RIVER**, tributary of the Colorado River, which has its rise in the northwestern part of the State of Colorado, in the Rocky Mountains, and flows south by west into the State of Utah to lat. 40° 39', and then almost directly south to 35° 40', where it unites with the Green River (q.v.) to form the Colorado. Its length is almost 400 miles. Its chief tributaries are the Dolores and Gunnison. There are many deep canyons along its course through the mountains, and although much of the valley land is fertile, but few settlements have as yet been made.

**GRAND RIVER**, in Labrador, is the largest river in this section of British America which flows into the Atlantic Ocean. It

risers in the Labrador Highlands, in Ashwanipi Lake. Its course, which is southward, is about 350 miles in length, flowing partly through a mountainous region and through a chain of lakes, and finding its outlet in Hamilton Inlet. The Canadian Geological Survey of 1894 gives the first reliable descriptions of this river and the adjacent country. See **GRAND FALLS**.

**GRAND RIVER**, Mich., has its rise in Jackson County, flows north and west in an irregular course for about one-half its distance, then west by north to Lake Michigan. Its whole length is nearly 300 miles, although a direct line from its source to its mouth is only about 100 miles. It is navigable from Grand Haven, at its mouth, to Grand Rapids, a distance of 40 miles. Above Grand Rapids there is a fall of 18 feet in one mile, which yields excellent water power.

**GRAND RIVER**, Mo., formed by the confluence of its Middle, East and West forks in Gentry County. It flows southeast through several counties, a distance of about 300 miles, into the Missouri River at Brunswick, Mo.

**GRAND TRAVERSE BAY**, an extension of Lake Michigan projecting into the State of Michigan, and named from Grand Traverse County, by which it is bounded on the south. The southern part of the bay is divided into two arms by Pregeenise Point, the western arm being bounded by Leelenau County and the eastern arm by Antrim County.

**GRAND TRIANON**. See **TRIANON**.

**GRAND TRUNK PACIFIC RAILWAY COMPANY**. This Canadian company was incorporated by act of the Dominion Parliament, 24 Oct. 1903, for the purpose of constructing a railroad from Moncton, in the province of New Brunswick, to some suitable port on the Pacific Coast, in the northern portion of British Columbia. It is the joint enterprise of the Canadian government and the Grand Trunk Railway. The route of the line from Moncton to Quebec runs near the northern extremity of the State of Maine; from Quebec the line runs in a westerly direction to a point on the boundary line between the provinces of Ontario and Quebec, south of and near Lake Abitibi, thence in a westerly and northwesterly direction passing to the north of Lake Nipigon, to a point in the city of Winnipeg, thence westerly passing Edmonton, and on through the Rocky Mountains to Prince Rupert on the Pacific Coast.

By an agreement entered into with the Canadian government, the latter undertook to build the section from Moncton, N. B., to Winnipeg, Manitoba, and lease it to the Grand Trunk Pacific Company for a period of 50 years at rental of 3 per cent on cost of construction. For the first seven years the company was to be subject to payment of working expenses only (the government waiving the rental). For the remainder of the period, the company pays rental at the rate of 3 per cent on the cost of construction, except that in the event the company fails to earn the rental due for the first three years, following the period of seven years during which the company pays no rental (the 8th, 9th and 10th years of the lease), then the rental so unpaid shall be added to the capital account and interest paid thereon at the same rate—3 per cent.

On the section Winnipeg to the Pacific Coast the Canadian government guaranteed for 50 years the payment of 75 per cent of the principal and interest of an issue of bonds not exceeding \$13,000 a mile for the prairie portion (Winnipeg to the foot-hills of the Rocky Mountains, a distance of about 1,200 miles) and guaranteed for three-fourths of the cost of the section through the Rocky Mountains. The remaining 25 per cent is guaranteed by the Grand Trunk Railway Company of Canada. The Grand Trunk Pacific Railway is to provide the equipment for the entire line. The capital stock of the company is fixed at \$45,000,000, of which \$20,000,000 is preferred stock. The \$25,000,000 of common stock is held by the Grand Trunk Railway Company of Canada.

The railways—although located in a more northerly latitude than any of the existing transcontinental lines—passes through a territory in a lower altitude, considerably lessening the cost of operation. The line crosses the extensive region of the Canadian northwest, which is enormously rich in agricultural and mineral products, at or about latitude 55°. The distances are as follows: Moncton to Winnipeg, 1,994 miles; Winnipeg to Prince Rupert, 1,746 miles.

Receipts on the Grand Trunk Pacific for year ended 30 June 1916 were: Passengers, \$1,029,580; freight, \$4,959,573; operating expenses, \$5,902,843.

Construction, however, proved very expensive, the endeavor to establish low grades which would permit maximum train loads to be hauled causing greater expense to be incurred than in the construction of either the Canadian Pacific or the Canadian Northern. The line was completed 7 April 1914, at a point 375 miles east of Prince Rupert, and through sleeping car and freight service began 2 Sept. 1914. Owing to the inability of the company to operate the line with any hope of financial success, the eastern section, from Winnipeg to Moncton, a distance of 1,994 miles, was turned over to the Canadian government in 1915, and is now operated as part of the government railways. (See **NATIONAL TRANSCONTINENTAL RAILWAY**). In 1916 the Grand Trunk Pacific Railway Company requested the government to take over the line from Winnipeg to Prince Rupert, but this proposal was declined. An offer by the government to "advance by way of loan sufficient money to supply any deficiency in the amount required to meet the fixed charges of the Grand Trunk Pacific for a period of (say) five years," was met by a declaration on the part of the company to accumulate further liabilities.

**GRAND TRUNK RAILWAY SYSTEM OF CANADA**. An international system of railways extending from Portland, Me., to Chicago, Ill., traversing the States of Maine, New Hampshire and Vermont, the provinces of Quebec and Ontario in Canada and the States of Michigan, Indiana and Illinois. The system (including leased and controlled lines) now comprises 5,382 miles of railway, of which about 1,000 miles of the main lines are double-tracked, including practically the entire distance between Saint Johns, Quebec, and Chicago, Ill., and (from Hamilton) to Niagara Falls. The Grand Trunk Railway Company was incor-

porated 10 Nov. 1852, by act of Parliament of the Dominion of Canada for the purpose of acquiring and operating as a unit various sections of railway then built, or in course of construction. The section between Portland, Me., and Montreal, Quebec, was opened in 1853, and the section Montreal, Quebec, to Sarnia, Ontario, via Toronto and Stratford, and the branch from Richmond, Quebec, to Point Levi, Quebec, the same year. In 1863 the line from Port Huron, Mich., to Detroit, Mich., was completed, thus providing a through route between Detroit, Mich., and Portland, Me. In 1880 the line from Port Huron, Mich., to Chicago, Ill., was completed and opened for traffic.

In 1882 the Grand Trunk acquired control of the Great Western Railway of Canada, extending from Suspension Bridge, N. Y., to Windsor, Ontario, with several branches north and south of the main line, and also the Detroit, Grand Haven and Milwaukee Railway, whose line extended from Detroit, Mich., to Grand Haven, Mich. In 1883 the Midland Railway of Canada was acquired, which included the branches north of the Grand Trunk Railway main line, extending from Belleville to Peterboro, Haliburton and Midland, in Ontario.

In 1888 an amalgamation was effected with the Northern and North Western System of railways extending from Port Dover and Hamilton to Collingwood, Meaford and Nipissing Junction, thus completing a network of railways under one management, reaching every town and village of importance in the southern peninsula of Ontario, and forming the consolidation of lines now known under the title of the Grand Trunk Railway System.

The Central Vermont Railroad and its leased lines, aggregating a total of 536 miles, is also controlled and operated in the interests of the Grand Trunk Railway System.

The Canada Atlantic Railway, extending from Swanton, Vt., to Ottawa, Ontario, the capital of the Dominion, and Parry Sound, on Georgian Bay, came under the control of the Grand Trunk Railway in 1905, and in 1914 it was merged in the system. The Canada Atlantic Transit Company, operating a line of steamers from Parry Sound to Fort William, Duluth, Milwaukee and Chicago is under the control of the Grand Trunk. A car ferry system is also operated between Windsor and Detroit, Milwaukee and Grand Haven and Coburg, Ontario, and Charlotte, the port of Rochester.

#### SUMMARY OF MILEAGE.

<i>Lines Owned in Full.</i>	Miles
Grand Trunk Railway.....	3,410
<i>Leased and Controlled.</i>

Grand Trunk Western Railway.....	347
Pontiac, Oxford and N. Railway.....	101
Toledo, Saginaw and Muskegon Railway.....	116
	1,382

At Portland, Me., the Grand Trunk Railway owns extensive wharf and elevator facilities, the capacity of the latter being 2,500,000 bushels. Seagoing vessels can dock at any stage of the tide, and trains can be run alongside at any hour of the day. At Montreal the elevator capacity owned by the company is 2,250,000 bushels, while at the various lake ports reached by the company, viz., Midland, Collingwood, Meaford, Goderich, Parry Sound and Point Edward, there are large transfer and storage elevators with a combined capacity of about 5,000,000 bushels.

Several engineering works of considerable magnitude are numbered among the undertakings of the company, those particularly worthy of mention being: (1) The Victoria Tubular Bridge across the Saint Lawrence River at Montreal, one and a half miles in length, originally opened for traffic in 1860 by the late King Edward VII, then Prince of Wales. This bridge cost \$7,000,000. In 1897-98 it was entirely rebuilt at a cost of \$2,000,000, and is now a modern open truss double-track structure, having carriageways and footwalks on each side, and is known as the Victoria Jubilee Bridge. (2) The Niagara Falls double-track steel arch bridge spanning the gorge, completed in 1897, and replacing the old original Suspension Bridge, which was for over 40 years a landmark to travelers and tourists. This is the largest single-arch railway and vehicle bridge in the world, having a clear span of 555 feet. (3) The International Bridge between Fort Erie, Ontario, and Black Rock, N. Y., a distance of over a mile, which formerly consisted of iron single-track trusses across the main river and harbor at Black Rock, opened for traffic in 1873. This bridge was entirely reconstructed in 1901, and is now capable of carrying the heaviest loads. (4) The Saint Clair Tunnel, under the Saint Clair River from Sarnia, Ontario, to Port Huron, Mich., a distance of two and a quarter miles, commenced November 1888; finished August 1890. The length of the actual tunnel under the river is 6,026 feet; interior diameter, 20 feet.

For the year ending 30 June 1915, the gross earnings of the Grand Trunk Railway proper were \$36,456,217, of which the freight receipts were \$23,714,813, and passenger receipts \$12,199,082. The operating expenses were \$27,634,801, leaving a net revenue of \$8,822,136. The equipment includes 1,044 locomotives, 1,069 passenger cars and 39,064 freight cars.

**GRAND WASH CLIFFS.** In the Colorado Plateau in Arizona, the rocks are for the most part nearly horizontal. They are cut, however, by several very large faults with a general north-south trend along most of which the west side has dropped many feet with respect to the east. The faults are comparatively recent and erosion has, therefore, not yet planed away the scraps; so that they show long lines of cliffs facing west. The most noted of these

faults are the Hurricane cliffs and the Grand Wash cliffs.

**GRANDFATHER CLAUSE**, a clause in the constitutions of some Southern States which provides that the law of disfranchisement by means of an educational qualification shall not apply to white illiterate voters whose fathers or grandfathers had been voters before 1867. A great majority of negro voters are disfranchised by means of the educational qualification, but the grandfather clause applies only to whites.

**GRANDISSIMES, The**, by George W. Cable. No one has approached George W. Cable in portraying and interpreting the charm of picturesque New Orleans. After scoring a brilliant success in his first volume of short stories, 'Old Creole Days,' he undertook the more ambitious task of writing the novel, 'The Grandissimes.' The setting is the old Spanish-and-French city that centered about the Rue Royale—"a long, narrowing perspective of arcades, lattices, balconies, dormer windows, low, tiled roofs, red and wrinkled, huddled down into their own shadows. . . . The human life which dotted the view displayed a variety of tints and costumes such as a painter would be glad to take just as he found them." If the scene of action shifts, it is to some historic building like the Cabildo, or the cathedral, or a stately mansion situated on the outlying bayous that then infested the suburbs.

The historic setting is that of the early years of the 19th century when the Americans had come into possession of the city and State. Agricola Fusilier, the representative of the proud families of the old régime, struggles somewhat tragically against the new order represented by the Americans and others with more modern ideas. Honoré Grandissime, the more progressive member of the Grandissime family, had been educated in Paris, where he had caught something of the revolutionary ideas that were remaking modern life. He makes the inexcusable mistake of "going over to the enemy," which phrase meant, in the language of the reactionaries, "affiliation with Americans in matters of business and of government, the exchange of social amenities with a race of upstarts." It implied a craven consent "to submit the sacredst prejudices of our fathers to the newfangled measuring-rods of pert and imported theories upon moral and political theories."

There are many other types of characters, notably the descendants of the De Grapions, a charming mother and her daughter, of the Creole type without the social prejudices of their clan and in a sense the victims of the social ideas that had prevailed. There are all sorts of negro types: Bras-Coupé, a former African king and now a slave; Clemence, the pedler, who goes through the streets singing the African folk-songs with a sort of weird intonation; and the two mulattoes, Palmyre and "the free man of color," who bears the same name as his white counterpart, Honoré Grandissime. These last two characters have naught in common with the members of the race to whom they are linked by reason of the slightest tincture of negro blood, and yet they are shut out from all the privileges and possibilities of the white race. At the end they disappear

mysteriously from New Orleans and go to France to end their tragic careers.

To these various types must be added one who is for a long time an outsider—Joseph Frowenfeld, a German immigrant with scientific training sufficient to make him the prosperous owner of a drugstore, and with sufficient knowledge of modern intellectual and social ideas to make him a disinterested critic of the existing order in his adopted city. In fact, he is a sort of chorus through whom the author expresses his own views. He is told by the representatives of the old régime that he must "fall in" with the ideas of the community in mind, in taste, in conversation. He does not do so, but gradually wins to himself all the more progressive types of the novel, and especially the love of the charming daughter of a distinguished Creole family.

Aside from the setting and characters, the interest of the novel centres in this interpretation of a vanished social order. There has been much controversy as to whether the author rightly and justly portrays the people of New Orleans, and still more as to his views of the negro problem. It seems as if, in his sense of the tragedy of the free people of color under the old order and the suggestion that the same injustice still prevails now that slavery has passed away, he becomes in the novel less of the pure artist that he was in his first volume and more of the propagandist that he was in a later book, 'The Silent South.' Whatever may be said of the justice of these criticisms, the novel remains one of the most ambitious attempts in American fiction and a very suggestive, if not convincing, contribution to the question of the relations of the races.

EDWIN MIMS.

**GRANDLEDGE**, Mich., city in Eaton County, on the Grand River and the Pere Marquette Railroad, 14 miles northwest of Lansing. The manufactures are flour, canned goods, sewer-pipe, conduits and tile, furniture and foundry products; and its trade is in its manufactured articles, and the products of the surrounding agricultural country. Coal and fire clay are found in the neighborhood. The city is popular as a summer resort. Pop. 2,893.

**GRANDPRE**, grān-prā', Canada, village in Kings County, in the province of Nova Scotia, on the Dominion Atlantic Railroad, 15 miles northwest of Windsor by rail. The Grandpré Dyke and Long Island lie between it and Minas Basin. Longfellow's poem, 'Evangeline,' has made famous this village and the country around. In 1755 the French settlers living here were driven from their homes by British soldiers. Pop. 400. (See NOVA SCOTIA). Consult Eaton, 'Acadian Legends and Lyrics' (1889); 'Acadian Ballads' (1905); Swan, H. K., 'Nature in Acadia' (London 1911).

**GRANET**, grā-nā', François Marius, French painter: b. Aix, in Provence, 1775; d. there, 21 Nov. 1849. After studying under Constantin and David, in 1802 he went to Rome, spending much of his life there. He gained an enviable reputation as a painter of architectural subjects, though no small number of his works are historical. He was appointed custodian of the paintings in the Louvre in 1826, and upon his death bequeathed his fortune to his native city for the erection and maintenance of a

museum there. The most famous of his works are 'Interieur de l'église des Capuchins à Rome' (1819); 'Eglise souterraine d'Assise' (1823); 'Le Tasse visité dans sa prison par Montaigne'; and 'Prise d'habit au couvent de Saint-Claire à Rome.'

**GRANGE.** See GRANGERS.

**GRANGEMOUTH**, Scotland, police burgh, parish and seaport of southeast Stirlingshire, situated close to the Firth of Forth and at the entrance to the Forth and Clyde Canal, and about three miles northeast of Falkirk. Its large docks are owned by the Caledonian Railway Company, and it has a harbor and graving dock. The principal industries are shipbuilding, saw milling and coal mining, while the manufacture of iron and steel, brick and tile is carried on to a considerable extent. The exports are mainly coal, iron and machinery; imports, dyestuffs, iron ore, margarine and pit props. Steamer services are maintained with London, Norway and Sweden, and the Baltic. Pop. of police burgh 10,219.

**GRANGER**, grän'jér, Francis, American politician: b. Suffield, Conn., 1792; d. 1868. He was the son of Gideon Granger (q.v.). Graduated from Yale in 1811, he began the practice of law in 1814, was elected from Ontario County to the State legislature of New York in 1825, was re-elected in 1826 and was a delegate to the Harrisburg (Pa.) Protectionist convention. He was prominent in the anti-Masonic movement of the time. In 1834 he was a leading candidate of the newly organized Whigs for the nomination for governor, and in 1834 and 1838 was elected to Congress, and in 1841 became Postmaster-General in President Harrison's Cabinet. He sat again in Congress in 1841-42, led the stampede of the Whig convention at Syracuse in 1850, and in 1861 was a member of the Peace convention held at Washington.

**GRANGER**, Gideon, American politician: b. Suffield, Conn., 19 July 1767; d. 31 Dec. 1822. He was graduated at Yale College in 1787, and having been admitted to the bar, rose to eminence in his profession, and was elected a member of the legislature of his native State. He had an active part in establishing the Connecticut school fund, and in 1801 President Jefferson appointed him Postmaster-General. He retained office during both of Jefferson's terms, and was reappointed by President Madison, whose policy he nevertheless opposed. He was consequently displaced in 1814, soon after Madison's second inauguration. He then removed to Canandaigua, N. Y., and was chosen a member of the senate of New York in 1819. He promoted internal improvements, and gave 1,000 acres to further the construction of the Erie Canal.

**GRANGER**, Gordon, American soldier: b. New York, 1821; d. Santa Fé, N. M., 10 Jan. 1876. He was graduated from the United States Military Academy in 1845, served with distinction in the Mexican War, during the Civil War was appointed, in 1862, to the command of the Army of Kentucky, with rank of major-general of volunteers, was prominent at Chickamauga, commanded a division at Fort Gaines (Ala.) (1864), and the 13th Army corps in the capture of Fort Morgan. Brevetted major-general for the capture of these forts, he was mustered out of the volunteers in 1866; in

that year was promoted to be colonel, and afterward was commander of the district of New Mexico.

**GRANGER**, James, English writer and print collector: b. Shaston, Dorset, in 1723; d. Shiplake, Oxfordshire, 15 April 1776. He studied for a time at Christ Church, Oxford, took holy orders, and was assigned to the vicarage of Shiplake. After a long pastorate there he went on a tour through Holland, in 1773. He wrote 'A Biographical History of England . . . with a preface showing the utility of a collection of engraved portraits, etc.' (1769). By 1824 his works had received enough additions to make six volumes. In 1806 the Rev. Mark Noble edited another edition of his works, and since then several editions of his works, together with additions by other authors, have appeared. The putting in of blank leaves into a book for the insertion of portraits cut out of other works is called, after him, "Grangerizing."

**GRANGER**, Robert Seaman, American soldier: b. Zanesville, Ohio, 24 May 1816; d. Washington, D. C., 25 April 1894. A graduate of the United States Military Academy (1838), he served in the Seminole, Mexican and Civil wars, and in the last named was brigadier-general of volunteers in 1862-65. During the Civil War he commanded the military district of northern Alabama, in 1864, in the same year defended Decatur against Hood, and in 1865, during the occupation commanded northern Alabama. In this latter year he was made major-general and later on lieutenant-colonel of the 11th Infantry. In 1871 he was promoted to the rank of full colonel.

**GRANGER CASES** (said by Justice Field during the trial to be the popular term outside for the whole group; but only as being in the farmers' interest, not because the Patrons of Husbandry, or any of its lodges as such, had anything to do with them), six cases decided in the United States Supreme Court, October term, 1876, all bearing on the same point and decided on the same principles. They were *Munn v. Illinois*; *Chicago, Burlington and Quincy Railroad Company v. Iowa*; *Peik v. Chicago and Northwestern Railroad Company*; *Chicago, Milwaukee and Saint Paul Railroad Company v. Akeley*; *Winona and Saint Paul Railroad Company v. Blake*; and *Stone v. Wisconsin*. The first, whose decision ruled the others and was given at much the greatest length, was to test whether the act of the Illinois legislature, 25 April 1871, to regulate public warehouses and the inspection and handling of grain, was constitutional. The case was an extreme one; the act was passed for warehouses only in "cities of over 100,000 people" (Chicago), and was therefore a special discrimination; it laid a host of minute, costly and laborious impositions on warehousemen and elevator owners, and obliged them to publish daily in the newspapers a table of the charges made the previous year, which must not be increased during the current year—therefore, of course, never, as each year was a canon for the next. The court decided that, according to immemorial common law, the government had a right to regulate the use of property for the public good, and to fix maximum charges for public services of those with

whom the public has no choice but to deal. Such regulations were never supposed to deprive private owners of their property, but the devotion of property to a use in which the public has an interest subjects it *pro tanto* to public control. In other words, the public is a partner in public corporations. The forms of law may be changed at the will of the legislative body, so long as they only give new effect to old provisions. And warehouses exclusively within one State may be regulated by State legislation, even though their business involves interstate relations. Justice Field made a powerful dissenting argument, concurred in by Justice Strong, on the ground that the legislature had no right to meddle with private business, and it was simply giving that body the power to confiscate private property, contrary to the Constitution. The railroad cases were all against the power of the States under legislation to enforce maximum transportation rates. The decisions were the same in essence, but the court declined to pronounce that the roads would forfeit their charter if they disobeyed the law, which, nevertheless, was not repugnant to the Constitution. The division of the court was the same; and Justice Field again stated the case for the companies. It was, that the charters of the roads were constitutional, and the right to reasonable compensation was the essential feature of the grant; that what was reasonable was a question for the judges and not the legislature to determine. Such regulation of fares as would take from a company the power to meet its just obligations was illegal, and only the courts could determine the facts; this, therefore, was taking away private property without process of law. Such an interpretation of the limits of legislative power over corporations places them at the mercy of every legislative majority. It makes all business public business, and practically destroys all the guaranties of the Constitution. Consult Hare, "American Constitutional Law" (Boston 1889).

**GRANGERS** (O. Fr. *grange*, Med. Latin *granea*, a place to store grain, *granum*), the popular name for the Patrons of Husbandry, a secret association in the interests of agriculture. In 1866 the government sent O. H. Kelley (on the staff of the Department of Agriculture) to inspect and report on agricultural conditions in the South, and suggest means of improving them; he found them very wretched, and the farmers poor, backward and disintegrated. Considering organization the first requisite for self-defense, and for securing improved methods and needed legislation, he, with six others, formed in December 1867 the National Grange (Farm) of Patrons of Industry. Only farmers could be members; but their women were admitted both to membership and office. The machinery was like that of other secret societies; the local bodies were called granges, and each State had its State grange. There were four "degrees" in local granges, one in State ("Pomona,") and two in national ("Flora" and "Ceres"). For the first four years the growth was slow; in 1872 it began to spread rapidly, in a year it had over 100,000 granges, and in 1875 its membership was 1,500,000, distributed through every State in the Union. By its rules the order was to have

no part in political work, nominations, or discussions, and as an order it had none, but the members could not be expected to neglect the very object of its existence, and almost immediately they began work against railroad rates and discriminations, trusts, "futures," oleomargarine, etc., besides forming the chief part of the great movement against hard money (see GREENBACK PARTY)—in all of which their organization, and the consequent bid for their support from political parties, aided them enormously. It is therefore not surprising that "granger" has become a typical adjective for all measures in the supposed interest of the Western and Southern farmers, or of which they form the chief support, the word having the sanction of the highest court (see GRANGER CASES). The Department of Agriculture as a Cabinet office, the act for founding experiment stations and the Interstate Commerce Bureau are among the more legitimate fruits of the order; others are the subject of much difference of opinion. It has also done much to form co-operative societies, and attempted to make the grain-elevator system a portion of it. The political element, however, was discrediting the whole movement by its excesses and ill judgment, and finally took separate shape as the Farmers' Alliance and the Populist Party (qq.v.), leaving the diminished Patrons of Husbandry to a useful and growing social and industrial influence. The farmers' movement had a membership of about 800,000 in 1874; but this had almost doubled itself in the following year, due to the reorganization of the preceding year. The National Farmers' Alliance and Industrial Union organized in 1889 was largely confined to the South where it gained considerable strength. The National Farmers' Convention held in Saint Louis in 1890 claimed to represent a membership of over 5,000,000 farmers. In 1892 a large part of the grange organization strength went to swell the Populist party, which, in the presidential election of that year, cast 1,041,021 votes.

**GRANITE**, an unstratified rock, normally consisting of three simple minerals, feldspar, quartz and mica, or, in Dana's nomenclature, of orthoclase, quartz and mica. Granite, in which the mica is the variety biotite, is called biotite granite; if muscovite, it is named muscovite granite; if much hornblende is present, it is called hornblende granite. It is an "igneous" rock of "plutonic" type, having originated beneath the surface under high pressure. Like surface volcanic rocks it has been fused and afterward cooled; but it does not, like them, comprehend tuffs and breccias, etc., but assumes a crystalline texture, destitute of pores, or cellular cavities to which gases entangled in lava or any such rock give rise. Its coarse crystallinity is due largely to the fact that it has cooled very slowly deep within the earth, giving plenty of time for complete crystals to form. A proof of its igneous origin is that it has in many places broken through ordinary sedimentary or metamorphic strata, sending dikes (q.v.) through them in various directions. It rarely, however, overtops or caps them, as if coming up molten through a crater it had overflowed them above. It is of all ages, some granite in the Alps having broken up through

the strata during Tertiary times, while large bodies of it are known of Precambrian Age. Granite is of much economic value as a building stone. The production of granite in the United States in 1914 was valued at \$20,028,919. The leading States in its production were Maine, Massachusetts, Vermont and Delaware. See *GEOLOGY; ROCKS*.

**GRANITE CITY**, Ill., city in Madison County, near the Mississippi, opposite Saint Louis, Mo., on the Cleveland, Cincinnati, Chicago and Saint Louis, the Wabash and several other railroads. It contains a public hospital and has iron and steel works, tinplate works, granite-ware manufactories, bridge works, a sheet-lead mill and a refinery for corn-products. In 1914 there were 39 establishments in operation with an aggregate capital of \$18,867,000, and giving employment to 5,658 persons. The salaries and wages paid amounted to \$4,806,000. The materials used were valued at \$9,845,000 and the value of the products was placed at \$17,903,000. It was settled in 1892 and the government is vested in a mayor and council chosen for two years. Pop. 15,142.

**GRANITE STATE**, *The*, the popular name of New Hampshire. Fine building granite is quarried at many points, notably at Plymouth, Concord, Milford, Pelham, etc.

**GRANOVSKII**, grān-ōf'skē-ē, *Timofei Nikolaevich*, Russian educator: b. 9 March 1813; d. 4 Oct. 1855. He received his elementary education at home where he studied French and English and spent his leisure in reading novels and works of travel and history. At the age of 18 he entered into a close friendship with his sisters' French governess, who exercised a powerful influence over him and aroused in him a wild desire for literature. In 1834 he was attached to the Ministry for Foreign Affairs, but four years later he was appointed secretary in the geographic department of the Admiralty. A few years later he was sent abroad (Berlin, Dresden, Prague) to specialize in history. Of all the historians his favorites were Leopold von Ranke, Ritter and Verder. In 1839 he went to Moscow and started a series of most interesting lectures on philology and law. His unusual eloquence combined with his natural poetic warmth won his students' sympathy to such an extent that he was soon recognized as one of the best improvising lecturers in the empire. Besides his courses at the university he gave a number of public lectures which increased still more his popularity, for he knew how to draw a synthesis of events which are described on various pages of history and of which he made always one picture that possessed a distinct character. He was not very fond of writing but his monographs 'Contemporary Condition and Importance of General History,' 'Patrimonial Existence of the Old Germans,' 'About the Fates of Italy,' etc., display a conscientious historian's activities: he banishes the idea of unilateral appreciations and optional conclusions, but points to the possibility of co-operation of natural science with history and endeavors to determine if history is entitled to an individual method, and, if so, to what extent.

**GRANT, Sir Alexander**, English educator: b. New York, 13 Sept. 1826; d. Edinburgh, 30 Nov. 1884. He went to India in 1859, and in

1862 became principal of the Elphinstone College, Madras, and in 1863 was made vice-chancellor of Bombay University. In 1868 he returned to Scotland to become principal of the University of Edinburgh, a position which he held till his death. He wrote 'Story of the University of Edinburgh' (1883).

**GRANT, Frederick Dent**, American soldier: b. Saint Louis, Mo., 30 May 1850; d. New York, 11 April 1912. He was the eldest son of Gen. Ulysses S. Grant (q.v.), whom he accompanied during several battles of the Civil War, being wounded at Vicksburg, and was graduated from the United States Military Academy in 1871, was assigned to the 4th Cavalry, was aide-de-camp to Sheridan in the latter's Indian campaigns, in 1874 served in the Black Hills expedition, and in 1881 resigned from the army with rank of colonel. He was Minister to Austria in 1888-93, and a police commissioner of New York in 1894-97. At the outbreak of the Spanish-American War (1898) he became colonel of the 144th New York Volunteers, was in the same year appointed brigadier-general of volunteers, served for a year in Porto Rico, and subsequently commanded the military district of San Juan. He was also stationed in the Philippines, and appointed brigadier-general in the regular service in 1901. He became major-general 6 Feb. 1906, commanded the departments of Texas 1902-04, of the Lakes 1904, of the East 1904-08, and from 1908 of the Lakes.

**GRANT, George Monroe**, Canadian educationist: b. Allion Mines, Nova Scotia, 23 Dec. 1835; d. Kingston, Ontario, 10 May 1902. He graduated at the University of Glasgow, was ordained to the Presbyterian ministry in Nova Scotia in 1860, and was minister of Saint Matthew's Church, Halifax, 1863-77. In 1872 he accompanied Sandford Fleming in his overland journey to the Pacific, of which he has left a graphic account in 'Ocean to Ocean' (1873). In 1877 he was appointed principal of Queen's University (q.v.), Kingston, Ontario, which he found in a languishing and almost moribund condition, but which he raised to a high position among the universities of the American continent. His literary works include 'Advantages of Imperial Federation' (1889); 'Our National Objects and Aims' (1890); 'Religions of the World in Relation to Christianity' (1894).

**GRANT, Robert**, American author and judge: b. Boston, Mass., 24 Jan. 1852. He was graduated from Harvard in 1873 and the Harvard Law School in 1879, and has practised law in his native city since 1879. He was one of the water commissioners of Boston 1888-93, and in the latter year became a judge of probate and insolvency for Suffolk County, Mass. He is overseer of Harvard College since 1895, and is a member of the American Academy of Arts and Letters and the Massachusetts Historical Society. He has published 'The Little Tin Gods on Wheels' (1879); 'Confessions of a Frivolous Girl' (1880); 'The Lambs,' verse (1882); 'An Average Man' (1883); 'Face to Face' (1886); 'Jack Hall' (1887); 'Jack in the Bush' (1888); 'The Reflections of a Married Man' (1892); 'The Opinions of a Philosopher' (1893); 'The Art of Living' (1895); 'The Bachelor's Christmas' (1895); 'Search Light

Letters' (1899); 'Unleavened Bread,' a novel which has been widely read (1900); 'The Undercurrent' (1901); 'The Orchid' (1905); 'The Law Breakers' (1906); 'The Chippendales' (1909); 'The Convictions of a Grandfather' (1912); 'The High Priestess' (1915).

**GRANT, (Hiram) Ulysses Simpson,** American general and 18th President of the United States: b. Point Pleasant, Clermont County, Ohio, 27 April 1822; d. Mount McGregor, N. Y., 23 July 1885. He was the eldest of the six children of Jesse R. Grant and Hannah Simpson Grant and on the paternal side is supposed to have been of remote Scottish descent. In 1823, a year after the birth of Ulysses, the family moved to Georgetown, Ohio, where Ulysses was brought up, working on his father's farm in summer and attending school in the winter. He detested the tanning trade, in which business his father was engaged, but was fond of agriculture and loved horses, becoming a remarkably proficient rider and teamster at an early age. After an elementary education in John D. White's subscription school at Georgetown, he was sent to Maysville Seminary, Maysville, Ky., which he attended in 1836-37, and in 1838-39 was provided with a winter term at an academy at Ripley, near Georgetown. In 1839 his father obtained for him an appointment to the Military Academy at West Point, but in making the application for Grant, Congressman Hamer erroneously called him "Ulysses Simpson Grant" instead of Hiram Ulysses, and thus his name appeared on the muster-roll. The young man was not displeased by the change and after a few years himself discarded the Hiram, which he had always disliked.

Grant's record at West Point was excellent in mathematics and engineering and fair in other studies but he surpassed all in horsemanship; he graduated in 1843, 21st in a class of 39, was commissioned brevet second lieutenant, assigned to the Fourth United States Infantry, and sent to Jefferson Barracks, near Saint Louis, Mo. In May 1844 his regiment was ordered to the southwestern frontier and in September 1845 to Texas as a part of the army under Zachary Taylor. On 30 Sept. 1845 he was promoted to full second lieutenant; in May 1846 took part in the battles of Palo Alto and Resaca de la Palma (qq.v.); in August, at Camargo, was appointed regimental quartermaster and commissary; in September was present at the battle of Monterey (q.v.), where he performed a daring ride under fire to obtain new supplies for the troops on the firing line; and in December was sent with his regiment to the mouth of the Rio Grande. He participated in all the battles of General Scott's march to Mexico City—Vera Cruz, Cerro Gordo, Contreras, Churubusco, Molino del Rey and Chapultepec (qq.v.), being made first lieutenant for bravery at Molino del Rey and brevetted captain at Chapultepec. His regiment was at Mexico City until June 1848, when it was ordered to Mississippi, but Grant obtained leave of absence and returned home to be married (22 August) to Miss Julia T. Dent. In July 1852 after four years of garrison duty at Detroit and Sackett's Harbor, the regiment was transferred by way of Panama to Fort Vancouver on the Columbia River; while there he endeavored to increase his income by farming,

cattle-raising and other enterprises, but invariably failed to improve his fortunes. On 5 Aug. 1853 he was promoted to a captaincy and ordered to Fort Humboldt, Cal., where he served until April 1854, but becoming disheartened by the never-ending vista of barrack life and far removed from the wholesome influence of wife and family, he fell into evil ways, began to drink and finally, was directed to resign or stand trial on charges. Accordingly he resigned from the service 11 April 1854 to take effect 31 July, and returned to Saint Louis.

Frederick Dent, who lived near Saint Louis, had given his daughter (Grant's wife) 80 acres of land, and on Grant's return loaned him \$1,000 with which to engage in farming. On this property Grant built a log cabin, which he called "Hard Scrabble," and lived there until 1858, clearing the land, hauling wood, plowing, hoeing and enduring all the hardships and privations of a small farmer. In 1858, however, he abandoned farming because of illness and returned to Saint Louis, where, during the next two years, owing to his inaptitude for ordinary business life and carelessness in money matters, he earned only a scanty subsistence in the real estate business. In 1860 he removed to Galena, Ill., where his father had established a leather store (a branch of his tanning business at Covington, Ky.), and there he worked at an annual salary of \$800 until the outbreak of the Civil War.

When a war meeting was held to secure enlistments Captain Grant was made chairman of the meeting but declined an offer of the captaincy of the company enlisted, saying "I have been a captain in the regular army. I am fitted to command a regiment." On 25 April, however, he accompanied the troops to Springfield, where on 8 May he was attached to the adjutant-general's office as mustering officer, mustering in several regiments, among which was the 7th District Regiment (later the 21st Illinois). On 24 May 1861 he tendered his services to the War Department at Washington, suggesting that he was competent to command a regiment, but received no reply and had almost abandoned hope of making any headway in the military service when (17 June) he was appointed colonel of the above regiment, though compelled to borrow money to purchase the proper officer's outfit. He served with his regiment under Pope in Missouri (endeavoring to suppress guerilla warfare), until 7 August, when he was appointed by Lincoln brigadier-general of volunteers, on 4 September assuming command of the district of southeastern Missouri and western Kentucky, with headquarters at Cairo. Immediately on his arrival he seized Paducah, Ky., a town of great strategic importance at the junction of the Tennessee and the Ohio rivers, on 25 September occupied Smithland, and then spent several weeks in organization and drill, in fortifying important locations and in reconnaissances against the enemy. On 7 November he attacked and captured the Confederate camp at Belmont, Mo., but the arrival of Confederate reinforcements compelled him to retire to his transports.

In February 1862, after much persuasion, Gen. H. W. Halleck allowed Grant to proceed against Fort Henry on the east bank of the Tennessee. Accordingly, with 15,000 troops, and accompanied by the gunboat flotilla under

A. H. Foote, Grant set out, and on the 6th, after a terrific bombardment by the gunboats, compelled the fort to surrender. He then invested Fort Donelson, on the west bank of the Cumberland River, 12 miles away. A Confederate sortie on the 15th failed to loosen Grant's grip and on the 16th Gen. S. B. Buckner proposed an armistice and the appointment of commissioners to settle terms of capitulation, but Grant replied: "No terms except unconditional and immediate surrender can be accepted. I propose to move immediately upon your works." Buckner surrendered the fort and about 15,000 troops and Grant became famous as "Unconditional Surrender Grant." This brilliant piece of work was the first important victory for the Union cause and its moral effect was tremendous. In spite of the jealousy of Halleck and his efforts to belittle and humiliate Grant, who afterward for a time was virtually under arrest, Lincoln nominated Grant as major-general of volunteers, to date from the surrender, and the Senate confirmed the appointment. See FORT HENRY AND FORT DONELSON.

Grant's next important battle was at Shiloh (q.v.) or Pittsburg Landing. At that point were five divisions of Grant's army, while he himself was at Savannah, nine miles away, awaiting the arrival of an army under Don Carlos Buell. On 6 April the Confederate army, under Gen. A. S. Johnston, attacked the Union troops at the Landing and beat them back to the Tennessee River with great loss; but Grant, having been reinforced by Buell's army, reformed his lines, renewed the battle on the 7th and drove the Confederates, now under Beauregard, Johnston having been killed in action, back to Corinth, Miss. The highly colored reports of this battle in the newspapers of the North called forth the most violent and acrid denunciations of Grant, who was charged with neglecting his army through dissipation, with recklessly exposing his men and with being in the rear at a critical time; moreover the public was dismayed by the large loss of life, this being the bloodiest battle up to that time in the history of the country. But Lincoln, unswayed by the widespread clamor for Grant's removal, resolutely rejected all such demands, saying "I can't spare this man, he fights." On 11 April Halleck arrived at the Landing and in a spirit of petty jealousy took personal command of the army, much to Grant's chagrin, and the latter, though nominally second in command, was completely ignored in the following ludicrous campaign against Corinth (q.v.), which was occupied by the Union troops 30 May. Grant was so disgusted by what he deemed an unwarranted displacement that he contemplated leaving the army but was dissuaded by Sherman. On 11 July, however, Halleck was called to Washington and left Grant in charge of the district of West Tennessee, embracing the territory west of the Cumberland River, with headquarters at Corinth. On 19-20 September Grant forced Price to retreat at Iuka (q.v.), on 3-4 October a part of his army under Rosecrans signally defeated Price and Van Dorn at Corinth (q.v.) and on the 25th he was placed in command of the Department of the Tennessee, charged with the special duty of taking Vicksburg.

By November 1862 Grant was in sufficient

force to undertake an offensive campaign. Sending Sherman to attack Vicksburg in front, Grant went to the interior to cut off escape by the rear. First came the reverse at Holly Springs (q.v.) 20 December and on the 29th the sanguinary battle of Chickasaw Bayou (q.v.) was fought, but on 10-11 Jan. 1863 Sherman managed to capture Arkansas Post or Fort Hindman (q.v.) and thus saved from utter failure a campaign that had been planned on an unsound basis and subjected to considerable interference by a series of political intrigues. Nevertheless Grant possessed the energy and persistency necessary to accomplish the task before him; the plan of campaign was changed several times without appreciable result, but finally, after months of seemingly hopeless work, by a series of brilliant manoeuvres, a regular siege of Vicksburg was instituted in May and on 4 July 1863 the fortress and town were surrendered with over 30,000 troops, the largest body of soldiers that had been captured on this continent up to that time. (See YAZOO PASS AND STEELE'S BAYOU; FORT GIBSON; RAYMOND; JACKSON; CHAMPION'S HILL; BIG BLACK; MILLIKEN'S BEND; VICKSBURG; FORT HUDSON.) Grant was now the "man of destiny" and a national hero; on 16 July Lincoln wrote a personal letter of congratulation and nominated him as major-general in the regular army; and in October he was placed in command of the Military Division of the Mississippi.

The fall of Vicksburg severed the Confederacy and in October, as little opposition was expected in that quarter, Grant proceeded to Chattanooga where Rosecrans, after the Tullahoma campaign (q.v.), and the disastrous battle of Chickamauga (q.v.) 19-20 Sept. 1863, was beleaguered by the Confederates under Bragg, while shortly afterward Burnside was besieged by Longstreet at Knoxville. By a series of swift and dramatic battles, 23-25 November, Grant captured Lookout Mountain and Missionary Ridge (see CHATTANOOGA) and completely routed Bragg (see RINGGOLD GAP), then sending Sherman to Burnside's relief at Knoxville (see CUMBERLAND GAP; ROGERSVILLE; CAMPBELL'S STATION; KNOXVILLE). This victory opened the way for Sherman's Meridian expedition (q.v.), his capture of Atlanta and his subsequent "March to the Sea." At its next session Congress not only passed a vote of thanks to Grant and his army and ordered a gold medal to be struck in his honor, but also on 29 Feb. 1864 revived the grade of lieutenant-general and on 2 March confirmed Lincoln's nomination of Grant to that position. A few days later Grant proceeded to Washington and assumed command of the armies of the United States, making his headquarters with the Army of the Potomac and immediately formulating plans to defeat the army under Gen. R. E. Lee and capture Richmond.

Grant's first movements, though unsuccessful in their main design, resulted in crippling the enemy but only at disheartening sacrifices of troops. He pursued a merciless policy of attrition and proposed to exhaust Lee's army, even though his gains were not commensurate with the unprecedented cost of these operations. In spite of repeated partial reverses and tremendous losses in killed and wounded, he never relaxed his hold on Lee's army, but slowly and

**ULYSSES SIMPSON GRANT**  
Eighteenth President of the United States

inexorably drove it back upon Petersburg and Richmond. Grant sent Sherman against Johnston who was protecting Atlanta and ordered B. F. Butler with the Army of the James to threaten Richmond from the southeast, while he himself, with the Army of the Potomac under Gen. G. G. Meade, attacked Lee. On 4 May 1864, with an army approximately twice the size of Lee's, Grant crossed the Rapidan, and on 5-6 May fought the bloody battle of the Wilderness (q.v.), suffering far greater loss than he inflicted (see also *TODD'S TAVERN*). Sheridan was then sent with the cavalry on a raiding expedition toward Richmond (q.v.; see also *PO RIVER*); and on 10-12 May, Grant engaged in the hardest and closest fighting of the war in the series of battles including the "Bloody Angle" at Spottsylvania Court House (q.v.). In spite of Hancock's success at the "Angle," Grant failed in his main purpose to break through Lee's centre, roll up his flanks and thus destroy the fighting morale of his army. But Grant had said: "I propose to fight it out on this line if it takes all summer," and accordingly continued to hammer at Lee, though for some time the latter managed to fight the Union army to a standstill and to frustrate every effort to draw him from his almost impregnable position (see *NORTH ANNA*; *HAWES' SHOP*; *PAMUNKEY* and *TOTOPOTOMY*). By this time also Gen. Franz Sigel had been defeated at New Market (q.v.) and Butler had been bottled up at Bermuda Hundred (see *DREWRY'S BLUFF*; *SWIFT CREEK*), wherefore Lee was safe from attack on that quarter and the Shenandoah Valley was open. On 3 June Grant tried to break through Lee's lines at Cold Harbor (q.v.) but the enormous loss of life in this unsuccessful assault convinced him that flanking movements were futile and too costly and that his only hope of capturing Richmond lay in taking Petersburg. Gen. J. H. Wilson led two cavalry divisions around Petersburg, destroying large sections of the Weldon and Southside railroads (q.v.) and Sheridan made a raid toward Trevilian (q.v.), but the midsummer heat prevented extended offensive operations (see *JERUSALEM PLANK ROAD*; *DEEP BOTTOM*; *SAINT MARY'S CHURCH*). On 30 July occurred the explosion of the Petersburg mine and the disastrous and abortive assault of the Confederate works. During the next few weary months attention was centred on the operations in the Shenandoah Valley (q.v.) where Jubal A. Early came in contact with Sheridan and finally on 19 Oct. 1864 was defeated by him at Cedar Creek (q.v.); on Sherman's campaign against Hood, resulting in the capture of Atlanta on 2 September and of Savannah on 22 December (see *MARCH TO THE SEA*); on Schofield's failure at Franklin (q.v.) 30 November, and on Thomas' overwhelming defeat of Hood at Nashville (q.v.) 15-16 December.

During this time Grant was constantly tightening his hold on Lee's lines (see *PETERSBURG*; *DEEP BOTTOM*; *GLOBE TAVERN*; *REAM'S STATION*; *FORT HARRISON*; *POPLAR SPRING CHURCH*; *HATCHER'S RUN* (*BOYDTON ROAD*); *FAIR OAKS* and *DARBYTOWN ROAD*) and waiting for Sherman and Sheridan to cut off Lee's sources of supplies from the south and west, planning thereby to starve him out. On 25 Jan. 1865 Fort Fisher (q.v.) was captured.

Sherman advanced from Savannah and pierced the Carolinas (see *SAVANNAH TO GOLDSBORO*; *KINSTON*), and in March, after the battle of Hatcher's Run (Dabney's Mill and Armstrong's Mill, q.v.), Grant began his great offensive against the Petersburg lines, first repulsing a sortie by Lee at Fort Stedman (q.v.) 25 March. On 31 March and 1 April, Sheridan won victories at Dinwiddie Court House, White Oak Road and Five Forks (qq.v.), wherefore on the night of 2-3 April, Lee abandoned his untenable position at Petersburg and ordered his troops to concentrate at Amelia Court House, south of Appomattox. The next day (3 April) Richmond was evacuated and the Union forces occupied the city, Grant continuing to pursue the Confederates, then in a desperate plight because their supply trains had been sent to the wrong place. By the 8th Lee was almost surrounded (see *FARMVILLE* and *HIGHBRIDGE*; *SAILOR'S CREEK*) and therefore on the 9th, realizing the utter hopelessness and futility of further resistance, he surrendered to Grant at Appomattox Court House. Grant afterward stated that he "felt like anything rather than rejoicing at the downfall of a foe who had fought so long and valiantly and had suffered so much for a cause," and therefore his terms of surrender were very generous, winning for him the respect and admiration of the Southern people. Subsequently, when a question arose as to whether Lee could be prosecuted for treason, Grant promptly declared that the terms of surrender included Lee and if such a course were pursued he would resign his commission and appeal to the country. Grant returned to Washington amid the rejoicing of the entire nation, soon to be plunged into despair by Lincoln's assassination. On 23-24 May he reviewed the army parade at Washington and then visited many Northern cities, receiving innumerable gifts from admiring citizens and honorary degrees from Harvard University and other institutions.

Respecting the reconstruction, Grant at first favored President Johnson and at his request made a tour of inspection of North and South Carolina and Georgia in the fall of 1865, reporting that "the mass of thinking men of the South accept the present situation of affairs in good faith." He also accompanied the President on his famous "swing around the circle" in 1866, though he took no active part in the President's propaganda in favor of his reconstruction policy. Having been commissioned General of the Armies of the United States (25 July 1866), Grant was now the foremost citizen of the republic and as he had become an available candidate for the Presidential nomination, the leaders of both political parties sought to secure his adherence, since it was probable that his popularity would influence a considerable independent vote. But President Johnson involved Grant in the struggle over reconstruction measures and by his course drove him into the radical ranks. In August 1867 Johnson suspended Secretary of War Stanton (q.v.) and appointed Grant Secretary *ad interim*, but on 13 Jan. 1868 the Senate disapproved of Stanton's suspension, whereupon Grant vacated the office. A dispute arose over Grant's actions in this connection, Johnson questioning his good faith, thus driving him into bitter opposition to Johnson and making him an advocate of impeachment. Hence,

in May 1868 Grant was unanimously nominated for the Presidency by the Republican convention at Chicago, and though taking little part in the campaign, defeated his Democratic opponent (Gov. Horatio Seymour), receiving 214 of the 294 electoral votes.

Grant's inexperience in civil administration was conceded, his lack of political finesse was admitted and his reticence and taciturnity were pronounced, but his strong will was also known and his rugged patriotism had been proven. He caused much criticism in forming his Cabinet owing to the preponderance of millionaires and personal friends and by making his personal appointments in the President's household largely from the military staff. However, he possessed the confidence of the people and this was increased by the negotiation of the Treaty of Washington (q.v. See also ALABAMA CLAIMS; HAMILTON FISH; UNITED STATES—HISTORY OF ARBITRATIONS; UNITED STATES—DIPLOMACY), but his persistent efforts to annex Santo Domingo led to much ill feeling and also to a rupture of relations with Charles Sumner (q.v.). Grant was deeply interested in South and Central American affairs and desired to recognize the Cuban insurgents but was dissuaded from so doing by Secretary Fish; in the subsequent *Virginius* affair, however, popular indignation was so thoroughly aroused that Grant put the navy on a war footing and later Spain rendered adequate reparation. The most important domestic problem during his first term, aside from his peaceful Indian policy and civil service reform, was the reconstruction of the Southern States, but as the actual work of reorganization was almost finished, the President was inclined to leave the completion of the task to the newly formed State governments (see UNITED STATES—THE RECONSTRUCTION). Still there was a growing conviction that the administration was inefficient, that the civil service was neglected and abused and that in his appointments Grant was yielding too frequently to the importunities of politicians; accordingly in 1872 a great reform movement was inaugurated, the instigators of which called themselves Liberal Republicans. Grant was charged with nepotism because of his numerous appointments to public office of relatives of his own and of the Deut families and with being "notoriously loaded down with presents;" and the Gould-Fisk attempt to corner gold, culminating in Black Friday (q.v.), was attributed to a New York speculator who had married into the President's family. But in 1872, despite these and other irregularities, such as the *Credit Mobilier* scandal (q.v.), ordinarily regarded as weaknesses in a candidate, Grant easily defeated his Democratic-Liberal-Republican opponent, Horace Greeley (q.v.), obtaining a plurality of over 700,000 and an electoral vote of 286. The new administration was almost immediately confronted with financial disaster and panic but the President rendered a great service to the country when he vetoed a bill passed by Congress for the inflation of the paper currency and urged the passage of the bill for resuming specie payments. The last years of his Presidency mark the lowest ebb ever reached in the political morale of the country. The "Salary Grab" (q.v.), the Whisky Ring Frauds (q.v.), the scandal in

the Treasury Department regarding the Sanborn contracts, the Safe-Burglary frauds, the Seal-Lock frauds, the Subsidy frauds, the impeachment of Secretary of War Belknap (q.v.) and other malodorous affairs aroused universal indignation and protest, though the President personally was in no way implicated. Probably never was Grant so low in the popular estimation as in the summer and fall of 1876. As a result the Democratic candidate (Samuel J. Tilden) received a majority of the popular vote in 1876, but the Republican candidate was placed in office by the decision of the Electoral Commission (q.v. See also UNITED STATES—DISPUTED ELECTIONS). During this time numerous threats were made of an appeal to arms, but Grant's disposition of the army prevented disorder and his influence counted for peace and restraint.

At the close of his second term in 1877 Grant, with his wife and youngest son, Jesse, made a tour of the world; he returned in September 1879 and in the spring of 1880 an effort was made to secure for him a third nomination for the Presidency, but the sentiment against a third term could not be overcome. Shortly afterward he moved to New York city and, besides accepting the unsalaried presidency of the Mexican Southern Railway, became a special partner in the firm of Grant & Ward; his name and property were used in the business but he took no active part in the management. In 1884 this firm failed, ruining Grant and other members of his family, and an unsuccessful effort was made to hold him personally liable. To satisfy his creditors he surrendered all his property, including the unique collection of souvenirs, swords and other mementoes gathered during his tour, and this collection eventually became the property of the nation. Every token of respect was shown him and in March 1885, by special legislation, Congress restored him to the rank of General (since he had resigned to become President) and retired him on full pay. When the first storm of criticism had passed, Grant undertook to write his memoirs, hoping that the sale would furnish a competence for his wife, and then began the most heroic year of his life. Though suffering almost ceaseless pain, owing to a cancerous growth in his throat, he continued steadily at this work, dictating when he could and writing when speech was impossible, and ultimately produced a work that took rank as one of the great martial biographies of the world. In June 1885 he was moved to Mount McGregor, near Saratoga, N. Y., in the hope that the change would benefit him, but the march of the fatal disease could not be stayed and he died on 23 July. His body found its final resting place in the great mausoleum on Riverside Drive, New York city, overlooking the Hudson.

**Bibliography.**—Among biographies of Grant, varying in merit, are those by A. W. Alexander (Saint Louis 1897); W. Allen (Boston 1901); Matthew Arnold (Boston 1887); Adam Badeau (Hartford 1887 and New York 1885); W. C. Church (New York 1897); F. L. Coombs (New York 1916); H. Coppée (New York 1866 and 1868); N. IRVING E. RINES,

Author 'History of the United States.'

**GRANT UNIVERSITY**, a coeducational institution in Chattanooga, Tenn., with departments in Athens, Tenn., founded in 1867, under the auspices of the Methodist Episcopal Church. The faculty consists of about 65 professors and instructors; the average annual attendance of students is 750.

**GRANTS PASS, Ore.**, city, county-seat of Josephine County, on the Rogue River and on the Southern Pacific Railroad, in the southeastern part of the State, about 60 miles from the Pacific. It is the commercial centre of an agricultural, lumbering and mining region; and its chief manufactures are lumber, flour, lumber and brick making. It has large railroad repair shops. Crater Lakes and the Oregon Caves are situated nearby and attract great numbers of tourists because of their scenic interest. Pop. 3,897.

**GRANULATION TISSUE**, the tissue formed in wounds to repair loss of substance. Through the clot in a fresh wound certain cells of the blood wander and begin to form new tissue. Blood vessels in tiny loops pass out from the sides of the wound. On the surface these loops form small rounded elevations, spoken of as "granulations." As the process goes on, the new tissue contracts, drawing in the sides of the wound; the skin grows out in delicate points from the margins of the cut. If the granulations pass beyond the surface-line because of irritation, they are spoken of as "superfluous" granulations or "proud flesh."

**GRANVILLE, Granville George Levenson-Gower**, 2d EARL, English statesman: b. London, 11 May 1815; d. there, 31 March 1891. He was educated at Eton and Oxford; entered Parliament in 1836 for Morpeth, afterward for Lichfield, both in the Liberal interest. He succeeded his father in the peerage in 1846. He became Foreign Secretary 1851-52. In 1855 he became president of the council, and ministerial leader of the House of Lords (1855-58). From 1859 to 1866 he was again president of the council, having previously failed to form a ministry under himself as premier. In 1868 he was Colonial Secretary under Gladstone, and in 1870 succeeded to the secretaryship for foreign affairs, which he held until 1874. During this period he negotiated the Treaty of 1870 guaranteeing the independence of Belgium, and "protested" against the Russian repudiation of the Black Sea clause of the Treaty of Paris. On the return of Gladstone to office in 1880 he was Foreign Secretary until 1885. During Gladstone's brief administration in 1886 he was at the colonial office. His 'Life,' edited by Lord Edmond Fitzmaurice, was published in 1905.

**GRANVILLE, N. Y.**, village in Washington County, on the Delaware and Hudson Railroad, about 37 miles northeast of Saratoga Springs and 57 miles northeast of Troy. The village is in an agricultural section, but nearby are valuable slate and building-stone quarries. The slate is used for mantels, roofing and marbleized slating. The trade of the town is in stone and slate from the quarries, butter, cheese, hay and vegetables. There are manufactories of shirts, gloves, infants' wear and condensed milk. The waterworks are municipally owned. Population of the village of Granville, not in-

cluding the several small villages, which are practically a part of it, was, in 1910, 3,920.

**GRANVILLE**, Ohio, village in Licking County, on Raccoon Creek, and on the Toledo and Ohio Central Railroad, about 25 miles northeast of Columbus. It has agricultural and manufacturing interests, but is chiefly noted for its educational institutions, which include Denison University (Baptist), the Shepardson College for Women, the Doane Academy and the Fanny Doane Home for Missionaries' Children. The electric-lighting plant is the property of the village. Pop. 1,394.

**GRAPE CULTURE.** The grape is believed to be the oldest of our cultivated fruits. Although some 1,500 varieties of grapes are cultivated in Europe, they are practically all from a single species of the vine, known as the *Vitis vinifera*. It is supposed to have been indigenous to Asia, where it was widely planted by different peoples centuries before it was introduced into Europe. The Phœnicians have the credit of introducing the culture of the vine into Europe, first into the islands of the Grecian Archipelago and thence into Greece and Italy. The Romans carried vine culture, as a part of their civilization, wherever they settled. Thus, the vine had become well rooted in the south of France, in the neighborhood of Marseilles, at the beginning of the present era. Its culture during the next 200 years spread northward.

The native grapes of America are of entirely different types from the European kinds. The reason is that America raises grapes largely for table, while the European grapes are grown for making wine. American grapes are (1) the native varieties, which are indigenous to the country; and (2) the *vinifera*, or European kinds, which have been transplanted here, and thrive outdoors only on the Pacific Coast, being suitable for wine.

The vine and its cultivation engaged the attention of early colonists, who were encouraged by the authorities and by the lawmakers. The Virginia assembly passed an act awarding premiums to successful grape growers. When the second charter was granted to Rhode Island by Charles II in 1663 it contained an inducement to anyone who would plant a vineyard. Queen Christina in her instructions to John Printz, governor of New Sweden, urged that vine growing be encouraged, and she instructed the governor to give the matter his personal attention.

Many of the immigrants to the different colonies came from noted vineyard districts of the Old World. It was only natural that they should try to introduce here the cultivation of those European vines with which they were most familiar. Thus, most of the early attempts to establish vineyards for profit were by foreign or foreign-born settlers. In 1792 or 1793 Pierre Legaux, a Frenchman, interested a number of Philadelphia gentlemen in his enterprise, and a company was incorporated for the purpose of planting vines. A vineyard was set out at Springmill, near Philadelphia, on the Schuylkill River. Foreign varieties of grapes were tried, but the experiment proved a failure.

About the same period (1790-93) a colony of Swiss grape growers from about Lake Geneva raised a fund of \$10,000 and vineyards were

planted in Jessamine County, Ky. Foreign varieties of grapes were tried, as had been done previously, but they all ran out and perished. Some years later, or about 1802, certain members of the Swiss colony removed to a place which they called New Switzerland (now Vevay, Ind.), on the Ohio River, 45 miles below Cincinnati. After failing with the best grapes imported from Switzerland, they tried a native variety called the "Cape," or the "Alexander" grape, and they then met with some success. This was largely due to the skill and experience of one member, John James Dufour, who joined the colony about 1805. He was an intelligent and observing vine-dresser, and afterward wrote a small treatise on grape culture and wine making—one of the first books on the subject published in this country. Dufour produced wine, which had a fair sale in the West, but by 1835 or 1840 the wines of Vevay were little heard of, and a few years later the vineyards had nearly disappeared.

Such, in brief, were the leading attempts to introduce the cultivation of European grapes into the Eastern States, beginning in 1620; not one lasting success is recorded.

However, in 1851 the European grape was being grown with success about the different missions. The popular variety was a kind now known as the "Mission grape," which is extensively cultivated in southern California to this day. Other and better of almost all the leading varieties of European vines have been planted in that State, and their cultivation was a success from the beginning. Our native grapes grow there also, but they are not cultivated to any extent west of the Rocky Mountains. Therefore, grape culture, especially in California, constitutes a separate chapter in American viticulture.

**The Cultivation of American Grapes.**—After experience had shown that European varieties of grapes would not thrive, practical horticulturists began to turn their attention to the native vines found growing wild, or partially cultivated. They saw that success lay in that direction. But the trouble was to obtain a native grape of superior quality for the table and for wine.

In 1819 Maj. John Adlum noticed a vine growing in a garden at Georgetown, D. C. The grape struck him as having many excellent qualities. He first supposed it to be a European variety, but the grape was really a native of North Carolina, where it was discovered in 1802, and it took its name from the Catawba River. Major Adlum was enthusiastic in his estimate of the value of the Catawba grape. In a letter, written shortly before his death to the Hon. Nicholas Longworth of Cincinnati, Ohio, he says: "I have done my country a greater benefit in introducing this grape than I would have done if I had paid the national debt."

There is no doubt that the Catawba grape has played an important part in the grape and wine industry of the United States. This was largely due to the heroic efforts of Nicholas Longworth, who is called "the father of American grape culture." He spent 40 years or more of his life and \$200,000 in establishing vineyards in the Ohio Valley, and his wine cellars at Cincinnati, Ohio. His persistent effort to make

the industry a success is a fine example of American energy and enterprise. Longworth obtained thousands of vines from Bordeaux and Burgundy, from the Rhine district of Germany, from Madeira (6,000 vines), and from the Jura (7,000 vines) in hopes of finding grapes which would thrive in his Ohio vineyards. He also tried native grapes, but most of these were given up for the Catawba, which he first received from Major Adlum in 1825.

Not only as a pioneer, but as a leader in grape and wine growing, Longworth exercised great influence on the industry. Many able and practical men in Cincinnati became interested in grape culture and, in 1848, the Cincinnati Horticultural Society estimated that within 20 miles of the city more than 1,200 acres were planted in vineyards. During the next three or four years, some six or eight wine cellars were established at Cincinnati. Longworth had two. At his cellars dry and sweet wines were made, and "sparkling Catawba"—the latter produced by fermentation in the bottle after the method of French champagne. It was after a visit to Mr. Longworth that the poet Longfellow wrote his celebrated poem on 'Catawba Wine.'

In 1858, Erskine made a report to the British government on the extent and condition of viticulture in the United States. He gave the vineyard area of the several States, as follows: 3,000 acres in Ohio; 1,000 in Indiana; 500 in Kentucky; 500 each in Missouri and Illinois; 300 in South Carolina; 200 in North Carolina; 100 in Georgia—a total of 5,600 acres of vineyard in the United States. Even at this time grape culture in the Ohio Valley was on the decline. The vines there were being steadily destroyed by mildew and rot. By 1865, these vineyards, which had promised so much pleasure and profit, and on which so much labor and money had been expended, were disappearing, and a few years later the grape and wine industry of the Ohio Valley became a thing of the past.

At that time the methods of successfully treating the two principal fungus diseases of the native vine—mildew and black rot—were not known to our viticulturists. Later on the discovery was made that black rot may be kept almost under control by a preparation of sulphate of copper, called the "Bordeaux mixture"—the cheapest and best fungicide ever introduced. As black rot prevailed from an early date in all the vineyards east of the Rocky Mountains, it was only after an efficient remedy was found that grape culture could become commercially profitable in the various Eastern States. In California, on the other hand, the vineyards were rather free from fungus diseases, but there, as in France, the phylloxera began its ravages about 1875, and has been the worst scourge of the vineyards on the Pacific Coast since then.

**The Growth of Grape Culture in the Eastern States.**—About 1865 the grape-growing industry became rooted in the Hudson River Valley, the lake regions of central and western New York and in northern Ohio, and on the islands in Lake Erie. New York, Michigan Ohio and Missouri are the leading States in the order named. New York's annual production is about 112,000 tons; but in all the other Eastern and Southern States grape growing exists on so small a scale as hardly to be

termed an industry. Production exists rather because a large number of small farmers like to grow a few for local use.

The grape industry of the Hudson River Valley was fairly established in the early '60s. Here, the Isabella grape was the leading variety. Like the Catawba, the Isabella is regarded as a native of North Carolina. About 1810 a vine was sent from the South to Col. George Gibbs, who planted it in his garden at Brooklyn, N. Y. A few years later, one of the successful pioneer viticulturists of this country, William Prince, of Long Island, N. Y., introduced this variety to growers, and he named it the "Isabella" in honor of Mrs. Isabella Gibbs. For a long time the Isabella was the standard grape in the New York vineyards, but of late years it has given place to other varieties.

Several varieties of grapes of good quality originated in the Hudson River district. Perhaps the most desirable kinds were the Iona and the Eumelan. The former was originated by Dr. C. W. Grant, of Iona Island, N. Y. With the Delaware it is considered one of the finest flavored grapes of American origin. The Eumelan is more for wine making than for eating. The vineyards of the Hudson River district in 1890 comprised about 13,000 acres. Since then the industry has gone backward, and at the present time the vineyard area is estimated at from 8,000 to 9,000 acres. There are one or two wine cellars in this district, but about 80 or 90 per cent of the grapes raised along the Hudson River are sold for table purposes.

**The Lake Keuka District.**—Small plantings of vines were made at Hammondsport, N. Y., at the head of Lake Keuka, from 1850 to 1860. But it was not until after 1865 that the grape industry there began to assume some commercial importance. In 1890, when the statistics of viticulture were gathered for the first time in the United States, there were more than 12,000 acres of bearing vines in the Lake Keuka district, and the growers shipped 20,000 tons, or 40,000,000 pounds, of table grapes to market annually. In addition to that amount, some 5,000 tons of grapes were sold to the local wine dealers. The vineyard acreage in this section did not continue to increase so fast, and in 1910 there were in the district 15,000 acres of vines.

The vintage begins usually the first week in September, when the early varieties (such as the Concord and Delawares) ripen. It lasts until the middle of October, when the last of the Catawbas are gathered. The crop is picked in boxes, which hold from 35 to 40 pounds. The clusters of fruit are cut from the vines by grape shears. When the boxes are filled they are carried to the end of the rows, where they are gathered two or three times a day and taken to the packing-house. Here the grapes are sorted, and packed in 5- and 10-pound baskets. This work is done mostly by women and girls.

The bulk of the grape crop is shipped by fast freight to the large city markets—to New York, Boston, Philadelphia. Within the past few years new markets have been opened in the Far West, and now it is common to find New York State grapes for sale in Denver, Omaha, Kansas City and even in Manitoba. The experiment was tried of shipping grapes

to England, but while the fruit arrived there in fair condition, the cost and prices received did not warrant making further efforts.

The Lake Keuka grape growers now have a long range of season—that is, they can supply table grapes from early in September till the following March and April. The early varieties cannot be held very long, but the Catawba, for example, which ripens late, is a "good keeper." The grapes are stored in crates or trays in a cool building or cellar, and by proper ventilation and by maintaining an even temperature they can be kept fresh and fair till spring. Some years ago the only grapes in market in mid-winter were hothouse grapes, which cost from 50 cents to \$1.50 a pound. Now these outdoor-grown grapes can readily be bought in January or February at 5 and 10 cents a pound.

The wine industry has also made striking progress in the Lake Keuka district. From the two or three cellars the number has increased to 12 at or near Hammondsport, N. Y. This section of New York State is often called "the American champagne district," as it produces about two-thirds of all the champagne made in the United States.

There are two important areas of vineyards adjoining the Keuka district, namely, the Seneca Lake district of about 5,000 acres of vines in Seneca and Schuyler counties; the Canandaigua district of about 3,000 acres of vineyard bordering on Canandaigua Lake.

**The Chautauqua Grape Belt.**—This is the greatest single strip of vineyard in the Eastern States. It stretches from the hills surrounding Chautauqua Lake, in western New York, along the shore of Lake Erie for some 50 miles. The growth of grape culture in the Chautauqua district was remarkably rapid. The industry began about 1840, that is rather in advance of the Hudson Valley district. It grew and prospered, and in 1910 the Chautauqua grape belt contained about 30,000 acres of vines. The annual yield of this district is about 5,000 carloads of grapes. Each car holds from 2,300 to 2,500 baskets. In addition, probably one-third, or more, of this amount is used to make wine. The making of unf fermented grape juice has become quite a large and growing industry in the Chautauqua district.

The bulk of the crop (about 80 per cent) is handled by an association of growers. The grapes are graded according to their quality, and the returns from the shipments are "pooled." Each grower gets his pro rata share, after deducting expenses. About 85 per cent of the grapes grown in the Chautauqua belt are of the Concord variety.

**The Northern Ohio Vineyards.**—Soon after the decay of grape culture in the Ohio River Valley, about Cincinnati, the industry became established in northern Ohio along Lake Erie. Here, the Catawba grape, which was destroyed by fungus diseases in the former locality, survived and soon became the leading variety. There are large stretches of vineyards all along the Lake Erie shore from Ashtabula to Sandusky. There are also several islands in Lake Erie covered with vines; of which Kelley's Island and Middle Bass Island are the best known. The total area of these vineyards in northern Ohio is estimated at from 8,000 to 10,000 acres. The Michigan grape industry became of some importance toward the close of

the 19th century. It developed mainly in the southern portion of the State, and by 1910 the annual crop was 60,000 tons, valued at over \$1,500,000.

**Summary.**—In the districts above described, the growing of grapes (both for the table and for wine making) is regarded as the chief industry. There are considerable vineyard areas in several of the Southern and of the Western States, and these may become important in the near future. New sections are being planted to vines from time to time; for example, of late years there has been quite an increase of vineyards in southern Michigan, and in the Ozark Mountain region of Arkansas and of southwestern Missouri.

Of American grape culture east of the Rocky Mountains two things may here be noted: First, although some 800 varieties are grown and flourish, yet the bulk of the crop in the leading districts consists of only two or three varieties, namely—the Concord, Catawba and Delaware; secondly, two-thirds of the grapes raised in the East are sold and used for table purposes, while only one-third of the crop is made into wine. It is just the reverse in California, for there two-thirds of the grape crop is turned into wine, the balance being used for raisins and the table. Therefore, not only in the fact that practically all of the grapes are foreign or European varieties, but in making wine the leading product of the vineyard crop in California is sharply defined from the industry east of the Rocky Mountains.

**Grape Culture on the Pacific Coast.**—Mention has already been made of the Spanish Fathers, who planted small patches of vineyards about their missions in southern California as early as 1770. The first plantings were at the mission of San Gabriel, and in the course of the next 75 years there were vineyards of from 5 to 25 acres extending from San Diego north as far as Sonoma County. The missions were abolished and their property confiscated in 1845.

The early settlers who began pouring into California in 1849 were more interested in gold than in grapes, and it was not until the year 1858 that a genuine widespread interest in grape growing arose in the new State. During the next three or four years many vineyards were planted, and the industry began to attract considerable attention, so much so that, in 1861, Governor Downey was authorized by the legislature to appoint three commissioners "to report upon the best means and ways to promote the improvement and culture of the grape vine in California." One of the commissioners appointed was Col. Agoston Haraszthy, who, by his writings and his efforts, was largely responsible for this renewed interest in grape culture. He went to Europe, visited the leading vineyard districts there and secured 100,000 vines embracing 1,400 varieties. These vines and cuttings were distributed from time to time in small lots to growers in different parts of California, and they formed a basis for the viticultural industry in that State.

The first, or experimental, era of the young industry may be said to go from 1861 to 1871. During this period the most popular grape was the old "Mission." It was hardy, vigorous and a good bearer. The "Mission" yielded a dry wine of rather inferior quality, which for some

years prejudiced dealers and buyers against the California product. It will, however, produce a sweet wine, of the sherry type, of good quality.

After a while it was demonstrated that the fine wine grapes of Europe would succeed and flourish in different parts of California. And then French, German and Italian vintners turned their attention to the vines they knew or had grown in the Old Country.

After 1871 grape growing in the State began to go backward, and this continued till 1879, when there came a "turn" in the industry. There was a short crop that year; the prices for grapes and wine went up, and soon there was renewed interest in viticulture. In response to a demand, a State Board of Viticulture was created in 1880. The board was composed of able and practical growers from the leading districts of the State, and their work resulted in a revival of the industry.

According to the census of 1890, there were then in California 155,272 acres of bearing vines. The California grape crop in the census year of 1909 was 989,843 tons, of the value of \$10,027,961. This is 77 per cent of the entire United States production, though only 49 per cent of the value, since most of the grapes are grown for wine, and bring a much less price than table grapes. A large quantity also goes into raisins. The California production more than doubled in the decade from 1899 to 1909. See RAISIN INDUSTRY, AMERICAN.

The shipping of California table grapes to the Eastern markets now amounts to about 1,200 carloads. The California shippers of table grapes labor under the difficulty of long distance from their markets. They have fine, beautiful varieties of grapes, but many of them will not stand the journey to the Eastern markets.

The leading varieties of California table grapes are Flame Tokay, Emperor, Cornichon, Black Malvoisie, Rose of Peru, Muscats, Thompson's Seedless, the Chasselas varieties.

**Practical Side of Grape Culture.**—The practical parts of vine growing cannot be learned from books, but is the result of hard work and years of experience. However, some of the more important features of vine cultivation may be mentioned. Of course, climate, location and soil play an important part in the yield and in the quality of the fruit. From early times the vine was generally set out on the hills with southern or eastern exposure. It is another curious fact that the leading grape districts of Europe and of the United States are located near a body of water. It is so in the great Medoc district of France, situated between the rivers Garonne and Gironde, and in Germany along the river Rhine. In the Eastern States we have the leading districts along the Hudson River, on the banks of Lake Keuka in central New York and along the shores of Lake Erie in northern Ohio. Such large bodies of water keep the vines from late spring or early fall frosts, and from heavy dews and fogs.

**Propagation.**—The propagation of the vine may be accomplished by seeds, cuttings, layers and grafts. The wild grape grows from, and multiplies by, the seed only. It reproduces itself, and its seedlings differ seldom from the parent vine. But, if we take the seed of the

cultivated vine, the seedlings show a wide variation, and that is seldom wanted, unless as an experiment to obtain new varieties. The usual method of vine propagation is by cuttings, which are made in the winter from the trimming of the vines. The cuttings are planted early in the spring, after the ground is thoroughly well prepared. It is usual to let the plants grow one or two years. The methods of transplanting these vines are various, due to the nature of the vines and to the methods followed in the various districts. Thus, in California rooted vines of one year are preferred; in the Eastern States growers prefer two-year-old transplanted vines.

**Grafting.**—The grafting of the vine, as with other woody plants, is quite easy, although it may be done in a number of ways. The time to graft is early in the spring before the sap starts. Fully a dozen methods have been named and described. The two kinds in most common use are the ordinary cleft or shoulder-graft, and the English or whip-graft. An ordinary graft is simply done by cutting the vine off three or four inches below the surface of the ground, then split with a grafting chisel, and held open with a wedge until the scion is fitted exactly into place. The cleft may be tied with a string, or covered with clay or grafting wax, and then the earth is heaped about the graft, leaving one bud of the scion above the surface. Grafting is of great importance to every vine grower in Europe and in California. For it is by grafting European vines on American stock that they can be protected from that dread scourge, phylloxera.

**Pruning and Training.**—The value of removing a portion of the vine and other woody plants was recognized at a very early date. Most of our native grapes are more vigorous growers and show a greater tendency to climb and spread than do the European vines. Pruning relates to the removal of such parts of the vine as ensures better fruit and larger yield. The general principles of pruning are practically the same for all vines, and these principles as given by Prof. L. H. Bailey are: (1) Fruit is borne on wood of the present season, which arises from wood of the previous season; (2) a vine should bear only a limited number of clusters, and (3) the bearing wood should be kept near the original trunk or head of the vine. Thus, the wood is constantly renewed, and new shoots which give wood, or canes, for the following year, are called "renewals."

Training relates to the form and disposition of the different parts of the vine. It is not necessary to describe the different methods of training. Each large vineyard district has its own system.

Brief mention may be made of the three well-known ways of training the native vine outside of California: (1) The so-called "Kniffin system" first obtained in the Hudson River district. The vine is allowed to grow at will the first season after planting; the second year it is cut back two or three buds from the ground, and from the stub only one shoot is allowed to grow. This is tied to a stake, at intervals, as it grows, to keep it straight to the height of the trellis. In the third year posts are set about 16 feet apart between every two vines. Two wires are then stretched along

the posts, the upper wire about five and one-half feet above the ground, and the lower one about half way between the upper wire and the ground. The vine is now tied to each wire, and cut off even with the upper one. The next year all the buds on the vine are rubbed off, except four—two for each wire. The two arms on the top wire are often bent down to the second wire, thus forming a droop, and the system is known as the "drooping system" of training.

(2) The Chautauqua system of vine training, as it may be called, is largely used in the vineyards of that district. In the first year the vine is cut back to three or four buds. The second year it is cut back to five or six buds, and three of the strongest shoots are left to grow the fruit-bearing arms for the third year. The trellis consists of three wires. Each year three or four of the strongest new canes are trained upon the trellis spread out in a fan shape.

(3) The Munson system of vine training is named after T. V. Munson, of Texas, a prominent viticulturist, and is adapted to the native vines of the Southern States. The trellis used is little different from that of the other systems. Thus, the posts are set about 24 feet apart, and carry two lines of wire. The vine is pruned back in the first year, and the next year the two arms may be allowed to bear a few clusters, if the vine is strong. The "bearing arms" are then cut back to one or two eyes each; the other arms to 8 or 10 eyes. These arms bear the next year, and are pruned for the third year quite short, while the bearing arms for the next year are pruned long. By this system of training there is a shifting of the bearing canes from one side of the vine to the other; all of which, it is claimed, gives vigor to the vine and a good distribution of the fruit.

**Diseases of the Vine.**—These are caused by animal and vegetable parasites. Of the former the worst and best known is the phylloxera. An American entomologist, the late Prof. C. V. Riley, discovered that some of our native American vines were infested by phylloxera, but they successfully resisted its attacks. He therefore recommended to the French and other growers of European grapes that they graft their vines on American stocks. This proved to be the solution of the problem, and practically all of the millions of vines planted in France during the past 25 years are on "resistant stocks," or American species of vines. It is the same in California, where the vineyards destroyed by phylloxera have been and are being replaced by vines grafted on American stocks. The main thing now is to get the right "resistant vines" for different soils and different climates. The other insect pests are the grape leaf-hopper, the root-worm, the flea-beetle, thrips, rose-bug, etc.

The leaf- or vine-hopper often does considerable damage in the vineyards of the East as well as in California. The best remedy so far recommended is a solution of whale-oil soap applied in a spray. The root-worm is at present working in the vineyards of Chautauqua and in northern Ohio. Two or three sprayings of arsenate of lead during the season is recommended, but thorough cultivation is regarded as the best check to the root-worm. See INSECTICIDES.

The leading vegetable diseases of the vine are mildew, black rot, oidium, anthracnose, ananias, etc. The effects of mildew are seen on the leaves, stem and the fruit. This disease is indigenous in this country, and first appeared in 1878 in Europe, where it spread over the vineyard districts, France, Germany, Italy and Spain, doing great damage.

Black rot was also introduced into Europe from the United States, but there it was not as serious as with us. The rot first affects the leaves and then passes to the fruit. The condition most favorable for the spread of both mildew and black rot is warm, moist weather. See FUNGI and FUNGICIDES.

**The Evolution of American Grapes.**—It should be noted, in conclusion, that the development of American grape culture has been a process of evolution with a survival of the fittest. Thus, the improvement in the quality of our native grapes has been something remarkable. It represents the difference between the wild grape—coarse, harsh and often disagreeable in taste and smell—and the cultivated grape—tender, luscious and sweet and delicate in flavor.

The botanists have described and put American grape vines into some 12 or 13 groups or classes. Only four American species of vines have been cultivated and developed to any extent, as follows: (1) *Vitis Labrusca*; (2) *V. Estivalis*; (3) *V. Riparia*; (4) *V. Rupestris*.

The *V. Labrusca* is generally known as the "fox grape," and is a native of the Atlantic slope from New England to South Carolina. The largest number of varieties of grapes in all the Eastern States now cultivated spring from this species, which includes the Concord, the Catawba, etc.

The *V. Estivalis* is the "summer grape" of the Middle and Southern States. Several varieties (such as the Lenoir or Jacquez, Herbe-mont, Cunningham, etc.) have been much used in France and in California as a grafting stock.

The *V. Riparia* is the grape vine of the river banks, and is found growing wild from Canada to the lower Mississippi Valley. This species is very highly regarded in France and California as a stock on which vinifera vines have been grafted with success.

The *V. Rupestris* is native of the country west of the Mississippi River from Missouri to Texas. The varieties of this species have not been much cultivated, but are used, almost exclusively, as resistant stocks in France and in California.

Thus far, the efforts of our horticulturists to develop and improve many new varieties of American grapes have been confined to a few species. In 1830 William Prince enumerated but 88 varieties of native grapes; to-day there are more than 800 kinds. Already they have accomplished splendid results by cultivation, and by hybridizing our vines with the best foreign kinds. We may look in the near future for the production of many choice grapes which will combine all the vigor, beauty of foliage and resistance to disease of the *Labrusca* and other American families with the delicate and fine qualities of the *vinifera*, or European varieties.

**Bibliography.**—The most complete books on grape culture have been written by the French experts, but their writings do not ap-

ply to American grape culture. Among the best books on the subject in French we may name the following: Guyot's 'Etude des Vignobles de France' (3 vols., Paris 1876); Foex's 'Cours complet Viticulture' (Paris 1875), and Coste-Floret's 'Les Travaux du Vignoble' (Paris 1898). The leading journal is the *Revue de Viticulture*, published at Paris.

The total United States production of grapes as reported in the last census for the year 1909 was 1,285,533 tons, of the value of \$22,027,961. This was one and a fourth times the production of 1899. California furnished over three-fourths, New York 10 per cent and Michigan 5½ per cent. About three-fourths of these grapes went into wine and raisins. The total wine and grape juice product in 1909 was 18,636,000 gallons, of which California made some 16,000,000 gallons. The most complete account of our native wines is found in the reports and bulletins of the Department of Agriculture. See also Wickson, E. J., 'California Fruits'; Hyatt, 'Grape Culture and Handbook for California'; Hedrick, 'Grapes of New York' (1907); Munson, 'Foundations of American Grape Culture' (1909), and the reports of the Board of State Viticultural Commissioners of California. See VITICULTURE; WINE-MAKING.

LEE J. VANCE,

Editor 'American Wine Press,' New York.

**GRAPE FERNS.** See FERNS and FERN ALLIES, *Ophioglossales*.

**GRAPE,** or **GLOBE, HYACINTH.** See HYACINTH.

**GRAPE INSECT-PESTS.** More than 200 species of insects have been observed preying on the grape vine in America. The principal pest is the phylloxera (*Ph. vastatrix*), which first attracted attention by its ravages in the vineyards of France about 1865. It now occurs in vine-growing countries all over the world, and is the worst of the very few insect-pests that have emigrated from America. It caused the destruction of 2,500,000 acres of vineyards in the United States in 1884. The phylloxera is a minute brownish plant-louse of the aphid family. (See APHIS). The winged females appear in Europe from August to October. Each lays about four parthenogenetic ova on the under surface of the vine-leaves. These ova develop in late autumn into males and females—wingless and without the characteristic piercing and sucking mouth-organs—which migrate to the stem of the vine. There each female lays a single egg under the bark. This egg lies dormant throughout the winter, and develops in April or May into a wingless but voracious 'vine-louse.' This form may pass to the leaves, on which it lays parthenogenetic eggs, and forms galls; but in Europe it attacks the roots, and lays its eggs there. From these in about eight days young develop, which become mature females in about 20 days, and lay more eggs in the roots. Half a dozen or more of these parthenogenetic generations follow in rapid succession throughout the summer. The roots become knotted and deformed; the whole plant suffers, and, though it may survive for several seasons, eventually dies. In midsummer, among the subterranean forms, a generation is born whose members, after four, instead of the usual three, moltings

associated with adolescence, become the larger winged females with which we commenced.

The destruction of this scourge of the grape vine, without also injuring or destroying the plants, has proved exceedingly difficult when attempted upon a large scale, where the expense prevents the use of chemicals or methods effective in a small garden. Water, wherever it can be applied to the soil so as to saturate and keep it saturated for a time, has proved a safe and effectual destroyer, because the insect cannot live in a medium saturated with water for long. Chemical remedies, such as bisulphide of carbon, have succeeded, when injected into the soil about the roots. In some of the French vineyards grafting the cultivated vines on certain of the native vines of America has been tried with some success. Although the insect seems to feed on the roots of these vines, the greater vigor of the American stocks appears to enable them to resist the injuries inflicted on them.

An important vine-pest in certain parts of the United States is the grape root-worm (*Fidia viticida*). Injury is chiefly due to the work of the larvæ or "root-worms," but the beetles also injure the plants by gnawing many holes in the leaves. Arsenical sprays, the destruction of the beetles by jarring and of the pupæ in the ground by cultivation, are all useful. One of the most troublesome enemies of the vine is the rosechaffer (*Macrodactylus subspinosus*), which is best kept in subjection by planting trap-crops of plants bearing white flowers which blossom at an earlier date than the grape, such as white rose, blackberry, spiræa and deutzia. The grape-vine flea-beetle (*Haltica chalybea*) does considerable damage at times to grape leaves, but can readily be destroyed with an arsenical spray, and may also be caught in the same manner as the plum curculio, by jarring the insects onto collecting frames saturated with kerosene. Nearly everywhere leaves will be seen drawn together and slowly assuming a brownish hue, and when these are opened a small caterpillar will be found actively wriggling about. This is the grape leaf-folder (*Desmia funeralis*). When vines are sprayed for leaf-feeding insects some of these leaf-folders will be destroyed, but picking and burning the affected leaves is more effective, taking care that the larvæ do not escape to the earth during the process. Leaf-hoppers do much injury in some localities, particularly on the Pacific Coast, and several other important enemies of the grape are known, including cutworms, which climb and defoliate vines at night, the grape-berry moth, which destroys the berry, and the grape curculio, which has the same habit. Consult Cornu, 'Etudes sur le Phylloxera vastatrix' (1879); Lichtenstein, 'Histoire du Phylloxera' (1878); Riley, 'Sixth Annual Report of the State Entomologist of Missouri' (1874); Saunders, 'Insects Injurious to Fruits' (1883); Bruner, 'Report of the Nebraska State Horticultural Society' for 1895, which gives an extensive bibliography; Marlatt, C. L. 'Principal Insect Enemies of the Grape' in *Farmer's Bulletins Nos. 70 and 284*, United States Department of Agriculture (Washington 1898).

**GRAPE-SHOT** is a combination of small cannon balls put into a thick canvass bag, and

corded strongly together, or fixed in a cylindrical frame, the diameter of which is equal to that of the ball adapted to the cannon. The number of shot in grape varies according to the service or size of the guns; usually, however, a round of grape-shot consists of nine balls in tiers of three. Grape-shot is now supplanted by shrapnel (q.v.).

**GRAPE-SUGAR.** See GLUCOSE.

**GRAPEFRUIT, POMELO, PUMMELO, SHADDOCK,** a tree (*Citrus grandis*) of the family *Rutaceae*, much resembling the orange, native of southeastern Asia, from whence it has been introduced in many warm countries. The name grapefruit seems to be derived from the fact that the fruits are often borne in clusters of three or more, much like a bunch of grapes. It is widely cultivated in the West Indies, California and southern Florida. It seems to have been introduced into Florida by the Spaniards in the early part of the 16th century, but commercial culture has been carried on only for about 25 years. In 1909, 1,061,537 boxes of fruit were produced in Florida and 122,515 in California, valued at over \$2,000,000.

**GRAPHIC METHOD,** a pictorial method of representing statistics by lines. Force, motion or any other physical quantity, such as temperature, atmospheric pressure or barometric height, electric potential, etc., may be represented by straight lines. Graphic methods are largely employed in physical investigations as aids to calculation, and for the purpose of exhibiting the nature of the law according to which some phenomena vary. The principal use of this method is to show the mutual variations of two quantities. This we will illustrate by a particular example. Suppose a table is drawn up, in one column of which are the months of the year, and in the other the corresponding average temperatures of the air, at some particular place, during these months (the average temperature for each month being the mean of the daily temperatures). Let two lines, OX and OY, be drawn from O, one horizontally, the other vertically; let the successive months of the year be represented on any convenient scale along OX, and let temperature be measured along OY, also on a convenient scale. Corresponding to each month in the year there will be a length along OX, and to each temperature there will correspond a point on OY. At the middle point corresponding to each month draw perpendicular to OX a line representing the temperature on the scale of OY. A series of lines will thus be obtained, through the upper ends of which there may be drawn, freehand, a smooth curve. The points on the curve in the figure represent the upper ends of these lines. Other graphic methods involve the use of polar, logarithmic and other varieties of co-ordinates. (See GEOMETRY, ANALYTIC). A general glance at such a curve will reveal certain features regarding the temperature of the whole year; at what dates maxima and minima occurred; when the temperature rose or fell quickest, and so on.

**GRAPHICAL STATICS.** Graphical static deals with statics by purely graphical or draughting-room methods: constructions made

with straight-edge, dividers, protractors, parallel rules, planimeters, etc. The analytic solution of a problem may give rise to a complicated formula, an infinite series from which it is difficult to compute, or to many simultaneous equations laborious to solve. Graphical methods overcome these disadvantages. They are very rapid in comparison with mathematical processes and quite precise when used carefully; they show at a glance the entire mechanism of solution. Although they give numerical answers—not formulas—that are only approximately correct, these results need never in engineering problems be less precise than the only approximately correct data. With average skill and good instruments it is possible to keep the thickness of points and lines within 0.005 inch and to set off distances of this size and angles of 0.1 degree. No graphical construction need have an error of more than 0.5 per cent, which is about the precision attainable with a small slide rule or with four-place logarithmic tables. All work is done to scale. Land, 'Die Maszstaebc bei der Zeichnenischen Loesung' (*Zeitschr. für Architektur u. Ingenieurwesen*, Heft 4, 1897) showed that the graphical units of length must satisfy the same relations as the functions themselves. Thus if  $z = f(x, y)$  then  $z_2 = f(x_2, y_2)$  where  $z_2$  is the scale value of  $z$ ; i.e., if  $x$  is pounds and the scale of pounds is, say, five pounds to the inch, then  $z_2 = 5$  and is represented by a line  $x/z_2$  inches long. Land gives a number of illustrations.

The entire subject is a direct development of the basic law of statics: the theorem of three forces. This is a form of the parallelogram of forces (see MECHANICS) and states that if three non-parallel, coplanar forces (all in one plane) are in equilibrium, the force vectors will be concurrent (through a common point) and will have such magnitudes and directions that they may be translated so as to form a closed triangle with the arrows running head to tail. Consequently if any number of concurrent, coplanar forces are in equilibrium their force polygon must close with the arrows pointing head to tail. For, any two of them can be replaced by a single force, this partial resultant can be combined with one of the remaining forces, and so on until the set is reduced to three which must satisfy the fundamental condition.

**Four Forces.**—Before dealing with non-concurrent systems we shall discuss the special case of four coplanar forces on account of its importance in engineering. The method was first extensively employed by Culmann in 1866. Forces in space are treated at the end of this article. If four forces are in equilibrium the resultant of one pair balances that of the other pair, or since it equilibrates the two remaining forces it must be coplanar with, and concurrent with or parallel to them.

If in Fig. 1 *P* is given and only the lines of action of *Q*, *R*, *S* are known, we have the construction shown, which fails, however, when (a) all four forces are concurrent or parallel, (b) three are concurrent or parallel.

**Coplanar Forces in General.**—If *n* forces *P, Q, R, ..., Z* are in equilibrium any one of them will balance the resultant of the other *n*—1. The construction is made as follows: Resolve *P* into any pair of components *A* and *B*, com-

bine  $B$  with  $Q$ , this resultant with  $S$ , and so on until  $Z$  is left. Then  $A, Z$ , and the resultant of the others must satisfy the theorem of three forces. The reader should have this process

FIG. 1.

clearly in mind while studying the following illustration.

Let  $P, Q, R, S$  in Fig. 2 be in equilibrium; their vector polygon in ii will close. In ii resolve  $P$  into any pair of components  $A, B$ . Draw  $C$  (the resultant of  $B, Q$ ) and  $D$  (the resultant of  $C, R$ , i.e., of  $B, Q, R$ ); ii gives only magnitudes and directions, the actual positions being shown in i. The three concurrent lines  $A, B, P$  in i correspond to the triangle  $ABP$  in ii; similarly, in i,  $C$  must be concurrent with  $B$  and  $Q, D$  with  $C$  and  $R$ , and  $D$  with  $S$  and  $A$ . Before going further observe the peculiar correspondence between the two diagrams: three

FIG. 2.

forces forming a triangle in ii have three concurrent parallels in i; but there are exceptions to the converse. This is a simple case of *reciprocal* diagrams or figures, which were so called by Maxwell, 'On Reciprocal Figures and Diagrams of Forces' (*Philosophical Magazine* 1864) who was the first to discuss their properties with any degree of completeness. Cremona, 'Le figure reciproce nella statica grafica' (1872), developed them into a branch of geometry.  $ABCD$  in i was named the *funicular polygon* by Lamé and Clapeyron in 1826 for a reason which will be evident later. In ii  $ABCD$  are the rays which meet at the pole. The fundamental property of the funicular polygon is that every vertex lies on a force, and conversely. Balanced forces form a closed vector polygon. This is necessary but not sufficient for equilibrium, and corresponds only to the conditions for

concurrent forces. In order that the system may not have a resultant *moment* it is necessary that any force be at least collinear with the resultant of the rest of the set. Thus in i the sum of the moments of  $P, Q, R, S$  cannot vanish unless  $S$  lies on the line of action of the resultant of  $P, Q, R$ , i.e., unless  $S$  passes through  $A$  and  $D$ . This condition requires a complete or closed funicular polygon. Hence the graphical criteria of equilibrium are

- (1) For equilibrium of translation the force polygon must close.
- (2) For equilibrium of rotation the funicular polygon must close with a vertex on every force.

The following solutions show how to apply these conditions.

I. To find two unknown magnitudes. Suppose that a weightless beam carries a load  $W$  and rests on two supports as in Fig. 3. It is required to find the reactions  $R_1$  and  $R_2$ ,

FIG. 3.

which are evidently vertical. The answers are obtained as follows; it is left to the reader to supply the underlying statical reasons. In ii draw  $W$  and any rays  $a, b$ , and in i parallels to  $a, b$ , intersecting on  $W$ .  $R_1$ , as yet unknown, will be determined by some ray  $c$  also unknown. Now from the two triangles which any assumed ray  $c$  forms with  $a$  and  $b$  in ii we can find the two points of concurrence through which  $c$  must pass in i; this gives the true direction of  $c$ .

II. To find two unknown magnitudes and one unknown direction. The rod in Fig. 4 weights 200 pounds, rests on a knife edge, is hinged at the left, and is subjected to 200 pounds at the right. Find the reactions. In this problem we shall use a slightly modified

FIG. 4.

form, due to H. T. Eddy, of the ingenious notation devised by R. H. Bow in 'The Economics of Construction in Relation to Framed Structures,' (1873); the full power of the nota-

tion will not be evident until we take up frames. Let the forces  $ab$ ,  $bc$ ,  $cd$ ,  $da$ , naming first all those completely known, then  $cd$ , known only in direction, and finally the least known force—the hinge reaction  $da$ —of which only a point of application is given. The forces are to be used in this order. In ii draw  $ab$ ,  $bc$  and rays from any pole  $O$ ; this is as far as we can go. However, assume a

FIG. 5.

ray  $Od$  and imagine it completed. In i draw  $oa$ ,  $ob$ ,  $oc$ . Now  $od$  must go through the intersection of  $oc$  and  $cd$  and of  $oa$  and  $da$  since it forms triangles with them. But the intersection of  $oa$  and  $da$  cannot be found unless  $oa$  passes through the hinge. Hence to solve a problem of this type, start the first ray through the only given point—usually a hinge—the solution is then easily finished. Observe that, for example, the sides  $ob$  and  $oc$  of the funicular polygon meet on the force  $bc$ .

III. To find three unknown magnitudes. Two of the unknown magnitudes can be replaced by a single force through their intersection, unknown in direction as well as in magnitude. The problem therefore is reduced to type II.

**Properties of the funicular polygon.** If a string, fastened at  $A$  and  $B$  is in equilibrium under forces  $ab$  and  $bc$  as in Fig. 5 it is evident that if  $O$  is properly chosen the sides of the funicular polygon will coincide with the lines of the string (Latin, *funiculus*). The string polygon gives also the lines of thrust in an arch. The determination of the forces in a loaded cable or an arch requires the polygon to pass through two and sometimes three given points. Consider first the effect of shifting the pole. Assume, for brevity, two forces  $ab$ ,  $bc$  and construct two funicular polygons with any poles  $O$  and  $O'$ , Fig. 6.

The pairs of forces  $O'a$  and  $O'b$  and  $Oa$  and  $Ob$  in ii have the same resultant, and if their senses are properly chosen they will be in equilibrium and form the quadrilateral  $OaO'bO$ . By the theorem of four forces the line through  $P$  and  $R$  must be parallel to  $OO'$ ; by similar reasoning  $Q$  is also on this line. Hence corresponding pairs of sides of two polygons intersect on a line, called the *polar axis*, parallel to that connecting the poles. Consequently to pass a funicular polygon through two given points, say  $P$  and  $P'$ , proceed thus: draw any polygon through  $P$  and pass one side  $o'b$ , of another through  $P'$ . This determines a point  $R$  on the polar axis through  $P$ . Then  $O'$  must lie on a parallel to  $PR$  and on a ray  $O'b$  parallel to side  $o'b$ . Furthermore if the polygon is to go through another point  $P''$  (not shown) besides  $P$  and  $P'$ , the new

polar axis must pass through  $P$ ,  $P'$ . Hence from  $O'$  draw a parallel to  $PP'$ ; the new pole  $O''$  will lie on it and its position will be determined by the direction of the side which is arbitrarily chosen to pass through  $P''$ .

**Historical.**—The germ of graphical statics dates back to Stevinus, 'Beghinselen der Waagkonst' (1585), who experimented with loaded cords. But the first systematic geometric treatment was published by Varignon, 'Nouvelle mécanique ou statique' (1725). For many years following, graphics was utterly neglected; indeed, Lagrange, boasted that his great 'Mécanique analytique' (1788), a work of almost 800 pages, contained not a single diagram. Poinsot, 'Statique graphique' (1804), Lamé and Clapeyron (1826), Poncelet, 'Cours de mécanique industrielle' (1828), and Möbius, 'Lehrbuch der Statik' (1837) were the only important writers after Varignon. The studies of Maxwell, 1864, and Cremona, 1872, cited above, were the first of the modern investigations. To Culmann, whose 'Graphische Statik' appeared in 1866, belongs the honor of having produced the first great treatise on graphical statics as a branch of technical mechanics. Among recent treatises Lévy, 'Statique graphique' (1886-88), Henneberg, 'Statik der starren Systeme' (1886), Müller-Breslau, 'Die graph. Statik der Baukonstruktionen' (5th ed., 1912) and Mohr, 'Abhandlungen aus dem Gebiete der technischen Mechanik' (1905) are perhaps the most important. Mohr's researches, extending over a period of 40 years, are the most noteworthy since those of Maxwell and Culmann; he has enriched nearly every department of structural mechanics.

FIG. 6.

**Frames.**—The principal statical systems to be studied by the aid of graphics occur in such structures as bridges and buildings. A frame is a structure built up of rods or links so as to form a geometric net work. It is jointed or pin-connected if its members are hinged by a single pin or rivet at each joint. If the joints are made rigid the frame is statically indeterminate but its internal reactions can be ob-

tained by assuming elastic deformation to take place. The forces which arise in this case are called secondary stresses. Engesser and Mandler made the first successful studies of them in 1878 and 1879; for the literature see Gehler, 'Nebenspannungen eisener Fachwerkbrücken' (1910). Consult also the books by Grimm and Johnson cited below under *graphical solutions*. Since the jointed triangle is the simplest frame it is usually chosen as the structural unit. It was used in ancient Roman and Egyptian constructions, and by the 16th century fairly complicated structures had been built. The external reactions on a frame cannot be found if they contain more than three unknown elements because there are only three conditions for the equilibrium of the frame as a whole. For this reason the fastenings of a structure to its abutments (supports) must be designed to secure rigidity without introducing more than three unknowns, and to allow slight motion due to deformations caused by elastic yielding and temperature changes without permitting the structure appreciably to change its position. Without going into the details of actual construction, we shall divide them into two types: hinge support to permit turning, and flat abutment to allow sliding.

**Statically determinate structures.**—A structure is statically determinate when all external and internal forces can be found from the conditions for equilibrium of a rigid body without regard to elastic or temperature deformations. The idea is due to Möbius. For each link of a pin-connected frame there are three equations of equilibrium and for each pin two equations. (See MECHANICS.) Hence a frame containing  $l$  links and  $p$  pins will yield  $2p + 3l$  equations. Although the frame as a whole will give three more equations, containing, however, only external reactions, they are superfluous because they can be derived from the  $2p + 3l$  equations by eliminating the internal forces. Or from another point of view, the whole frame is in equilibrium if every part is. Consider now the number of unknown quantities. The reaction at a hinge or pin is unknown in both magnitude and direction, or else consists of two forces unknown in magnitude but given in direction. That is, since each link can be held in equilibrium by two forces at each end,  $l$  links require  $4l$  unknown external magnitudes, the opposites of which act on the pins. In addition to these there are in general three unknown external elements; total,  $4l + 3$ . As the number of equations must equal the number of unknowns

$$l = 2p - 3,$$

which is the criterion to be satisfied by a statically determinate frame. One link with three pins counts as three links, being statically equivalent to a collapsed triangle; likewise, one link with  $n$  pins counts as  $2n - 3$ . By similar reasoning we find that  $l$  links will rigidly interconnect  $f$  frames if  $l = 3f - 3$ . Observe that  $2p - 3$  is odd. If  $n$  links meet at every pin,  $\frac{n}{2} p = 2p - 3$  because each link connects two pins; since  $p$  is a positive integer,  $n = 2$  or 3 and  $l = 3$  or 9: see Fig. 7. A frame is *redundant* or over-rigid if it has more than enough links, and deformable if it has less. Some frames which satisfy the criterion may be indeterminate and vice-versa; this is due to

special elements in their configurations. For example in Fig. 7, i, ii and iii are all constructed in about the same way. But the forces in ii and iii cannot be determined because instantaneous centers (see KINEMATICS) can be found for the parts above the section lines S. On the other hand v should be indeterminate but is not; vi is interesting because it contains no triangles at all.

**Graphical solutions.**—Graphical methods of solving problems in statics depend on several powerful theorems:

I. A body on which forces act at only two points transmits force along the line joining those points. The theorem of four forces is a special case, the points being the two intersections.

FIG. 7.

II. Three forces in equilibrium are either concurrent or parallel. This is the basis of the funicular construction.

III. A force on a rigid body can be replaced by any set of its components without disturbing equilibrium. In an elastic body the state of internal stress would be altered by such a substitution. By means of III we can replace the weight of members, and roof, snow and wind loads by their equivalent components acting at the pins of a frame.

IV. The equilibrium theorems as expressed by the force and funicular polygons and the reciprocal diagrams explained below.

V. Theorems based on the principle of work and virtual displacements. These cannot be dealt with in a brief exposition. Consult Hudson, 'Deflections and Statically Indeterminate Stresses,' (1911); Johnson, Bryan and Turneaure, 'The Theory and Practice of Modern Framed Structures' (9th ed.); Grimm, 'Secondary Stresses in Bridge Trusses.'

**Reciprocal diagrams.**—A frame acted on by pin loads or by intermediate forces replaced by their equivalent pin components, consists statically of as many sets of concurrent forces as there are pins. The resultant tensile and compressive forces in the members, which are two-point pieces, can be obtained in several ways, but in many problems in structural engineering the graphical solution can be carried systematically as shown in connection with Fig. 8. *i* shows a simple roof truss carrying a load  $W$  and resting on supports; the reactions are vertical. They are to be found in the simplest way; in this case, from the symmetry, each is  $W/2$ . Now put letters in the spaces between the forces, and numbers in the panels. The load  $W$  is then called  $ab$ , the reactions being  $bc$  and  $ca$ . The force in the vertical member is either 12 or 21 according to the pin on which it acts; in the member between  $A$  and 1 it is  $a1$  or  $1a$ . This is Bow's notation, mentioned above. Draw the external force polygon  $abca$ , taking the forces in alphabetical order. At the left pin there are three forces  $ca$ ,  $a1$ ,  $1c$  which must be named and used around the pin in the order the letters have around the truss: clockwise in this case. Since  $ca$ ,  $a1$ ,  $1c$  are in equilibrium they will form a triangle which is to be attached to the force polygon as in *ii*. In the triangle,  $a1$  (not  $1a$ ) acts from  $a$  towards  $1$  and therefore pushes on the left pin of the truss;  $a1$  is thus in compression.  $1c$  is in tension because  $1c$  (not  $c1$ ) acts from  $1$  to  $c$  and represents a pull. The quadrilateral for the top pin forces  $1a$ ,  $ab$ ,  $b2$ ,  $21$  is drawn in *ii*; similarly for the other pins. No pin can be used at which more than two unknowns act. Consider now the free body cut out by the line  $ss$ . Corresponding to the forces on it— $1a$ ,  $ab$ ,  $b2$ ,  $2c$ ,  $c1$ —there is a polygon  $1ab2c1$ ; the same is true of any part of the truss as a free body. Conversely, for every force polygon in *i* there is a free body in equilibrium in *ii*. This is the most general form of the reciprocal relation already seen in the funicular and force polygons. The diagrams in Fig. 8 are called Maxwell-Cremona diagrams; they were used independently however by Rankine, 'Applied Mechanics' (1857) and shortly afterwards by W. P. Taylor, a practical draughtsman.

**Henneberg's method.**—The Maxwell-Cremona construction cannot be employed in all

FIG. 8.

cases. In Fig. 7, *i* and *iv*, there is no pin at which there are only two unknowns, but by using the theorem of four forces on the parts cut out by the section lines  $ss$ , some of the internal forces can be found; the method then applies. Fig. 7, *vi*, cannot be solved by any method explained above. An ingenious graphical solution

which has not yet become current in textbooks was devised by Henneberg, 'Statik der starren Systeme' (1886). The frame in Fig. 9 will serve to illustrate the procedure.  $F_1$  is given and  $F_2$  is found in any convenient way. In order to make the structure indeterminate introduce a link  $L$  anywhere. Being indeterminate it

FIG. 9.

has an infinity of solutions two of which are to be got thus:

- Select any pin at which there are not more than three rods, e.g., that at  $F_1$ ; this will always be possible—see the discussion of determinateness above. Draw any polygon *ii* for it and find the remaining forces (not shown). Observe that  $P'$ ,  $Q'$ ,  $R'$  are not the required forces in the links of the given frame; they are merely those forces in the members of the redundant frame which can equilibrate  $F_1$ .
- The redundant frame may have initial stress, i.e., if  $L$  or any other link is too long or too short it will produce stress in all the members without the aid of external forces. Find any set of initial forces  $P_0$ ,  $Q_0$ ,  $R_0$  as in *iii* for the pin at  $F_1$  and then find the rest  $L_0$ ,  $S_0$ ,  $T_0$ , ... (not shown).

If  $P$ ,  $Q$ ,  $R$ ,  $S$ , ... are the actual forces before  $L$  is introduced we have for the pin  $F_1$  the vector sum

$$F_1 + P + Q + R = 0. \quad (\text{required forces})$$

From *ii*,  $F_1 + P' + Q' + R' = 0$  (assumed forces)

$$\therefore (P - P') + (Q - Q') + (R - R') = 0 \quad \dots (1)$$

$$\text{From iii } P_0 + Q_0 + R_0 = 0 \quad (\text{initial forces}) \quad \dots (2)$$

Since the sides of the triangles represented by (1) and (2) are parallel.

$$\frac{P - P'}{P_0} = \frac{Q - Q'}{Q_0} = \frac{R - R'}{R_0} = \lambda, \text{ say. } \dots (3)$$

It is on account of the triangles that a three-link pin was selected. In the same way we find for the upper left pin

$$\frac{R - R'}{R_0} = \frac{S - S'}{S_0} = \frac{T - T'}{T_0} = \lambda \quad [\text{by (3)}] \quad \dots (4)$$

For the lower left pin

$$\frac{T - T'}{T_0} = \frac{U - U'}{U_0} = \frac{V - V'}{V_0} = \lambda \quad \dots (5)$$

For the pin at  $F_2$

$$(Q - Q') + (L - L') + (U - U') + (W - W') = 0$$

$$\text{and } Q_0 + L_0 + U_0 + W_0 = 0$$

Since in these two quadrilaterals  $Q_0$  and  $U_0$  are proportional to  $(Q - Q')$  and  $(U - U')$  by (3) and (5), the quadrilaterals are similar, whence

$$\frac{Q - Q'}{Q_0} = \frac{L - L'}{L_0} = \frac{W - W'}{W_0} = \lambda; \dots (6)$$

and so on for the other pins. Hence there are the equations

$$\begin{aligned} L &= L' + \lambda L_0 \\ P &= P' + \lambda P_0 \\ Q &= Q' + \lambda Q_0 \end{aligned} \quad \dots (7)$$

where  $P, Q, \dots$  are the required,  $P', Q', \dots$  the assumed, and  $P_0, Q_0, \dots$  the initial forces. Tensions are positive hence in this case  $Q'$  should be negative. The correct value of  $L$  is zero because the redundant link is unnecessary for rigidity;

$$\lambda = -\frac{L'}{L_0}$$

so that  $P, Q, \dots$  can be found from (7). The solution may be shortened by taking one of the assumed forces, as  $R'$ , to be zero.

**Space forces.** The graphical equilibrium conditions for concurrent forces in three dimensions are obtained from Fig. 10.

FIG. 10.

$PQRSTU$  is a closed space polygon and  $PQR, S, T, U_0$  its projection on the plane of  $PQ$ . It is possible for  $P \dots U_0$  to be closed while  $P \dots U$  is open, for instance when the tail of  $S$  is vertically above the head of  $R$ ; but then no other projection of  $P \dots U$  can close. Without putting the argument into more formal shape we may at once conclude that the necessary and sufficient conditions for the equilibrium of concurrent forces in space are that the projected polygons on two non-parallel planes shall close. The theorem of four forces in three dimensions follows from the fundamental theorem of three forces: the resultant of one pair must balance, and therefore be coplanar with, the other pair. For non-concurrent space forces in general, the conditions for equilibrium are derived at once from the fact that if any system is in equilibrium its projection on any plane is also. The projections on the three co-ordinate planes of  $XYZ$  axes give three closed force polygons and three closed funicular polygons if the original system has no resultant force or no resultant moment. It is easy to show, as in the case of concurrent forces, that two closed force polygons are sufficient to make the resultant force vanish. On the other hand all three funicular polygons are necessary because each corresponds to a moment condition: the moment of a force may be zero about two non-parallel

axes without being zero about a third axis. There are then five necessary and sufficient conditions for the equilibrium of the most general system of forces:

Two closed force polygons on non-parallel planes,

Three closed funicular polygons on non-parallel, non-collinear planes.

RICHARD F. DEIMEL,

Assistant Professor of Mechanics, Stevens Institute of Technology.

**GRAPHITE**, crystalline or amorphous carbon. It crystallizes in rhombohedral forms, but is commonly foliated or earthy. It has a gray metallic lustre, and is greasy to the feel. Its hardness is 1-2 and its specific gravity 2.1-2.2. The better grades of natural graphite contain 90-95 per cent of carbon, the impurities being chiefly earth or rock. It occurs as an original mineral, minutely disseminated through many igneous rocks. Its most common occurrence, however, is in beds of highly metamorphosed rocks of sedimentary origin, probably representing original organic matter, from which, by heat and pressure, the volatile hydrocarbons have been driven off, leaving pure carbon behind. It probably represents the extreme end product in the same process that forms coal (q.v.). Most of the domestic supply comes from pre-Cambrian rocks in the Adirondack region of New York. Rhode Island is also a producer. Canada and Bavaria yield important quantities, while Ceylon is the world's chief producer. Because of its refractory character it is used in the manufacture of high temperature crucibles. It is also used in paint, and as a lubricant. Much of it is used in making lead pencils (so-called "blacklead"). Graphite is made artificially at Niagara Falls, N. Y., where large quantities of anthracite coal and other forms of amorphous carbon are converted to this product. The electric furnace process renders it possible to make graphite of the highest purity, and also possessing certain definite chemical and physical properties.

The annual electric furnace production of graphite at Niagara Falls amounts to over 13,000,000 pounds, the production increasing rapidly to meet the demand. About 30 different grades of artificial graphite are now produced. The art of making graphite in the electric furnace was invented and developed by Edward G. Acheson (q.v.) to whom credit for creating carborundum (q.v.) is also due. Dr. Acheson is also the inventor of deflocculated graphite, which is graphite reduced to the molecular condition, this latter process being operated in Port Huron, Mich. In the deflocculated form graphite diffuses itself through water and oil, and is the basis for valuable new lubricants known as oilclag and aquadag (q.v.). See ELECTROCHEMICAL INDUSTRIES.

**Production.**—The amount of crystalline or flake graphite mined in the United States in 1916 exceeded that of any previous year, and showed an increase of 55 per cent in quantity and 117 per cent in value over the output for 1915. The 18 mines which were active produced 10,931,989 pounds, valued at \$914,748. Alabama continued to be the leading producer, her seven mines yielding 5,226,940 pounds—48 per cent of the production of the whole country. Pennsylvania's five mines, with a com-

bined output of 1,095,716 pounds, retained her in second place. In New York, three mines were active; in California, one; in Montana, one, and in Texas, one. Of amorphous graphite, the domestic production totaled 2,622 tons, mined in five States—Colorado, Michigan, Nevada, North Carolina and Rhode Island.

Imported graphite continued to dominate the market, constituting 85.4 per cent of the total supply of the crystalline form—mostly from Ceylon—and 80.5 per cent of the amorphous supply—largely from Mexico and Chosen. The amount imported in 1916 was 64,120,000 pounds of crystalline graphite and 10,857 tons of amorphous graphite. The enormous increase in the 1916 consumption of graphite in the United States above that of 1915, amounting to 66 per cent in crystalline, and 156 per cent in amorphous graphite, is attributed to the remarkable expansion in the electrochemical industries, and the consequent demand for graphite electrodes.

**GRAPHOPHONE**, an apparatus similar in principle to the Edison phonograph (q.v.), and designed to reproduce human speech and other sounds. It was invented conjointly by Messrs. C. A. Bell and Charles S. Taintor.

**GRAPHOTYPE**, a process of engraving discovered in 1860 by De Witt Clinton Hitchcock, by which the valuable improvement is effected of enabling the artist to be his own engraver. The discovery is utilized in the following manner: French chalk is by a careful process ground to the finest powder, which is repeatedly passed through a wire-cloth with 10,000 holes to the square inch. It is then laid between a smooth plate of zinc and a smooth plate of steel and submitted to intense hydraulic pressure, after which it is sized to prepare it for the artist. The pencils used by the artist are of sable-hair, and the ink is composed of lamp-black and glue. The drawing, when finished, is gently rubbed with silk velvet or fitch-hair brushes until the chalk between the ink lines is entirely removed to the depth of one-eighth inch. The block is then hardened by steeping it in an alkaline silicate, by which the whole of the chalk is converted into stone. Molds are then taken of it, from which stereotype plates are cast for printing. See **ZINCOTYPE**.

**GRAPTOLITOIDEA**, an extinct order of colonial animals the position of which in the animal kingdom is only imperfectly known. While it is usually supposed that they are *Hydrozoa*, it has been suggested that they are *Bryozoa*. They are confined to the Lower Palaeozoic and are especially common in shales, where their chitinous exoskeleton is found pyritized or carbonized. The colony seems to start in its development from a single conical compartment called the sicula. From this start one or more branched or unbranched tubes called common canals, each opening into one or more extremely regular rows of cup-like hydrothecae, which probably constituted the exoskeletons of individual polyps. The method of branching and the angle between branches is quite definite in a given species. In the wall of a single-rowed common canal on the side opposite the hydrothecae or in the centre of a double-rowed common canal there is usually a

peculiar bar of tissue prolonging the conical end of the sicula, and known as the virgula. The graptolites are extremely important in the correlation of different geological formations, for it seems that they were attached to seaweeds, and floated with them to all parts of the ocean, so that their rapid distribution was assured. The many changes which they underwent is also an aid to the dating of rocks in which they occur. Consult Bessler, 'Dendroid Graptolites of the Niagara Dolomites at Hamilton, Ontario' (Bulletin of the Smithsonian Institution No. 65, Washington 1909); Rüdemann, 'Graptolites of New York' (Memoir New York State Museum, Nos. 7 and 11, Albany 1905-08).

**GRAS**, Felix, Provençal writer; b. Malesmont, near Avignon, 3 May 1844; d. Avignon, 4 March 1901. His education ceased at 17, when he returned to his father's farm, from which he was sent, in 1864, to Avignon and articulated to Jules Gécia, a man of letters as well as a lawyer, and a member of Félibrige, a Provençal literary club of which Frédéric Mistral (q.v.) was a member. Amid such surroundings he accepted law as his profession but resolved on literature as his vocation. In 1876 he published his first important work, an epic poem in 12 cantos, 'Li Carbounie,' which won for him the first place among Provençal writers of the younger generation. 'Toloza,' an epic recounting the crusade of Simon de Montfort against the Albigenes, followed in 1882. He proved himself second only to Mistral among Meridionals by a collection of his shorter poems to which he gave the title 'Lou Roumancers Prouvençal' (1887). In his collections of prose stories, 'La Papalmo' (1891), he fancifully describes, in vivid, racy style, the loves and hates, sensuality and "superstition" of the papal court at Avignon. His greatest popular success, 'Li Rouge dôu Mejeur' (1896), was published in a translation, 'The Reds of the Midi,' before it saw the light in France, where it is not so popular as among those who read it in the English version alone. A more recent work, which has been translated in the United States under the title 'The White Terror,' describes the retaliatory violence of the Royalists in the south, when the storm of the Revolution had swept by. For 10 years previous to his death he had been Capoulé, or president of the Félibrige. See **REDS OF THE MIDI**, **THE**.

**GRASMERE**, gräs'mër, England, village, in Westmoreland County, on the lake of the same name. It has been made famous by the "Lake School of Poets," Wordsworth, Southey and Coleridge. Many places in Grasmere and the surrounding lake country have been mentioned in the poems of the authors who frequented this section, especially by Wordsworth. The graves of Wordsworth and Hartley Coleridge are in Grasmere.

**GRASS**. See **GRASSES IN THE UNITED STATES**.

**GRASS, China**. See **RAMIE**.

**GRASS, STRAW**, or **PAMPASS CAT**, a wildcat (*Felis pajeros*) of southern South America, common on the grassy plains. It is described by Hudson ('A Naturalist in La Plata,' 1892) as not unlike the European wildcat

in its robust form and dark color, "but a longer, more powerful animal, inexpressibly savage in disposition."

**GRASS-BASS**, the calico-bass (q.v.).

**GRASS-FINCH**. See VESPER SPARROW.

**GRASS-PINK**, or **CALOPOGON**, a showy orchid (*Limodorum tuberosum*), with a small bulbous root, large ovate leaves, sheathed at the base, and flowers growing in a loose spike upon a slender stem 12 to 18 inches high; they are butterfly-shaped, fragrant and magenta pink; and the lip, which is exquisitely bearded with gay colors, remains on the upper side of the flower, giving the blossom an upside-down appearance. It is common in boggy places from Florida to Newfoundland. Several other species of the genus occur in the South, one of which (*L. multiflorum*) bears many more flowers than does the grass-pink.

**GRASS-SNAKE**. See GREEN SNAKE.

**GRASS-SNIPE**, a gunner's name for the jack-snipe (q.v.), and some other shore-birds of similar habits.

**GRASS-TREE**, the popular name for certain tree-like Australian rushes of the family *Juncaceæ*. Their large stems are crowned by thick tufts of narrow, pendulous foliage and by cylindrical flower-spikes like exaggerated cat-tails. The plants contain an aromatic resin (Botany-bay gum or gum acaroides) employed in pharmacy, and also used by the natives for a variety of purposes, such as caulking canoes, and as a cement or glue. These plants are also called "black-boys" from the appearance of the stems when charred by fire, and from the fact that the black-skinned natives often use them as a means of concealment, or even imitate the appearance of a charred stem by crouching into a similar attitude, and so escape the eyes of enemies.

**GRASS VALLEY**, Cal., city, in Nevada County, on the Nevada County Narrow Gauge Railroad, about three miles northeast of Marysville and 65 miles northeast of Sacramento. It was one of the first settlements made after gold had been discovered in the State. It is in a rich gold quartz mining region, and the chief occupations are connected with mining. It has granite and marble works, a distillery and large wineries. It contains a public library, high school and two orphan asylums. It is the seat of Saint Mary's Academy. Pop. 4,520.

**GRASS WORM**, the caterpillar of a noctuid moth (*Laphygma frugiperda*), which often does great damage to grasses and cereals in the Southern States, and to a great variety of crop plants, as in 1899, when a serious outbreak of this species extended from Mexico to Chicago. In the North it is known as the fall army-worm, from the fact that it appears and travels in greatest numbers in the autumn, devouring nearly every form of vegetation encountered in its line of march.

**GRASS-WRACK**, a maritime grass. See **ELGRASS**.

**GRASSE**, François Joseph Paul, français zhō-zéi pōl grās, COUNT DE, French admiral: b. Valettes, Provence, 1723; d. Paris, 11 Jan. 1788. He first entered the navy of the Knights of Malta, and served against the Turks; in 1749 entered the French navy, be-

came captain in 1762, and rear-admiral in 1778, and was appointed to command a squadron sent to the West Indies. In 1781 he was given the rank of admiral and sent with a fleet to co-operate with the land forces in the American colonies. He first assisted at the taking of Tobago, in the West Indies, then sailed to the mouth of the Chesapeake, where he repulsed the attack of the British fleet under the command of Graves, prevented aid from reaching Cornwallis at Yorktown and cut off his retreat, thus materially assisting the decisive American victory there; for these services he received the thanks of Congress. He then went to the West Indies, where for a time he was successful against the British, capturing the island of Saint Christopher; but on 12 April 1782 was surprised by the English fleet under Rodney, and after a hard fight defeated, and taken prisoner. He was accused of carelessness and even treachery, but was exonerated by an official investigation, and at the time of his death held the rank of lieutenant-general of the naval forces of France.

**GRASSERIE**, a disease of silkworms (q.v.).

### GRASSES IN THE UNITED STATES.

The term "grass" is popularly applied to the green herbage on which cattle and other beasts feed, and thus includes many plants which are not botanically related to the true grasses, such as the clovers, alfalfa, sanfoin, vetches, spurry, etc., frequently referred to as "artificial grasses," while it excludes some of the most important of the true grasses, namely, the cereals. The true grasses constitute the botanical family *Gramineæ*. They are distinguished from related groups of plants in that the leaves are arranged in two opposite rows on the stem, with a single leaf at each joint. The stems (culms) are usually hollow except at the joints, and the base of the leaf forms a sheath which surrounds the stem above the joints. The sheath is usually extended a short distance above the base of the blade of the leaf, in a delicate, whitish structure closely surrounding the stem, called the ligule, the office of which seems to be to prevent rain-water from percolating between the sheath and the stem. The grass flower usually consists of the following parts: flowering glume, palea, lodicule, one to six stamens (usually three), and a one-celled ovary usually with two styles tipped with plumose stigmas. The flowers are usually arranged in two rows on opposite sides of the rachilla, constituting a spikelet. At the base of the spikelet are usually two empty glumes. The empty glumes, flowering glumes, and palea constitute the "chaff." The spikelet may contain one to many flowers. The lodicule, which stands in front of the flowering glume, is very small, usually not noticeable except on close examination. At flowering time, the lodicule becomes greatly swollen, and by this means spreads the flower open. In spikelets that contain several flowers, the palea, or inner chaff, rests with its back against the rachilla, and is concave on the back, with a nerve or keel on either side. The edges of the palea are overlapped by the edges of the flowering glume, or outer chaff. The spikelets are arranged either in spikes, as in wheat, or in panicles, as in oats. Popularly, these are referred to as the "seed-head," and

this term will be frequently used in this sense in this article. The fruit of the grasses is a seed-like grain, either adherent to the chaff, as in barley, or free from it, as in wheat.

This is one of the largest and most widely disseminated families of plants, and by far the most important to mankind. It includes the cereals, wheat, oats, barley, rye, rice, millet and corn, sugarcane, sorghum, the cane of the Southern canebrakes and the bamboo of the Old World, in addition to the common grasses of the fields and prairies. It furnishes the principal food of both man and beast, and some of the most beautiful ornamental plants (reed, Ravenna grass, plume-grass, ribbon-grass, etc.). The grasses are the foundations of agriculture. Their principal development is in the temperate zones, though grasses are found wherever vegetation flourishes. Singularly enough, the most important grasses, the cereal grains, are not known in the wild state, and their cultivation extends so far back into antiquity that even their places of origin are unknown. Either their wild counterparts have become extinct or the cereals have been so changed by cultivation that their wild forms are no longer recognizable. (Wild plants have recently been discovered in Palestine that are believed to be the progenitors of wheat). There are in all about 4,000 distinct species of grasses known. The species of only two natural orders of flowering plants exceed this number, namely, the *Compositae* and the *Leguminosae*, though in the number of individual plants the grasses far surpass all others. The total number of grass species growing in the United States is about 1,400; in the limits of the State of Washington about 275 species are found. Originally, nearly half the area of this country consisted of prairies, the principal herbage of which was grasses. The existence of these vast stretches of grassland has never been fully accounted for. It is not due simply to climatic and soil conditions, for many species of trees readily grow on the prairies when placed there by man. In recent years, vast areas that were formerly occupied by grasses have been invaded by various shrubs and trees, particularly the mesquite tree of the Southwest. This has occurred simultaneously with the destruction of the grasses by stock, indicating that the presence of the grasses is inimical to forest growth. It is well known that grasses thrive best on the more compact soils. On such soils, the abundant growth of grass, with the fires that have swept over these regions in dry seasons from time immemorial, has kept in check those classes of vegetation which could not quickly recuperate after the destruction by fire of their aerial portions. On the coarser types of soil, the sparse growth of grass, and the consequent lack of fuel to feed the fires, has enabled forest trees to become established. These facts, while they do not entirely account for the existence of prairies, are undoubtedly an important element. The prairies are particularly developed in the arid and semi-arid regions where frequent drouth has augmented the destruction occasioned by fires, and particularly on the heavier soils of that region which retain sufficient moisture to enable the grasses to form a complete covering over the soil.

Of the many grasses (popularly known as such) native to this country, or of the introduced grasses that have become established here,

comparatively few are of economic importance. Their principal use is as food for live stock. Most of them grow too sparsely to be important for this purpose, and many of them are not nutritious enough to make them valuable as food. A considerable number, however, are both nutritious and palatable to stock. Yet the number of these which are propagated artificially is exceedingly small when compared with the total number of species. This is partly accounted for by the fact that a few species are surpassingly useful by reason of abundant growth, ease of propagation, nutritive value and palatability. When such a grass becomes established in a region to which it is adapted the effort to find other valuable sorts in a measure ceases. But there are vast sections of country, particularly in the cotton-producing States, and the arid and semi-arid West, where good grasses, adapted to local soil and climatic conditions, have not yet become established as field crops. Not that there are no good grasses known in these regions, for there are many of them, but it happens that these grasses are not easily propagated or have some characteristic which renders them undesirable. The well-known and valuable buffalo grass (*Bulbiparva dactyloides*) of the West and Southwest is an example in point. It is one of the most nutritious and palatable of all the grasses, and produces abundant feed, but it produces very little seed, and that only on trailing, vine-like stems, from which it is impractical to harvest it. Many of the grasses which formerly constituted important factors on the ranges of the West, and which are eminently adapted to the climatic and soil conditions there, are rendered useless on cultivated lands by reason of their poor seed habits. What the breeder's art may accomplish in rendering these now useless grasses useful, by improving their seed habit, remains to be seen. The leading tame grasses of the country are as follows:

**Timothy (*Phleum pratense*).**—The acreage of this grass in the United States is twice as great as that of all other cultivated grasses put together. It may be said to be the hay grass of the country. Its supremacy is due first of all to its excellent seed habits. The seed from an acre of it will seed a larger acreage than is the case with any other grass. The seed is easily harvested, and retains its vitality for several years. It also produces relatively large yields of hay, which, although not so nutritious as the hay from some other grasses, is eaten readily by all kinds of stock. It is particularly valuable for horses, because of its favorable physiological effect on the digestive apparatus. Owners of livery stables, whose horses are liable to be subjected to hard driving after heavy feeding, will feed no other hay when timothy is available. Timothy is usually sown with wheat, in fall, at the rate of about eight pounds of seed per acre, the seed being cast on the bare ground behind the drillplows. Clover is then, frequently added, at the same rate, in early spring, though farmers who raise much hay for sale prefer to omit the clover, as the pure timothy is preferred by horsemen. After the wheat crop is harvested, the grass is ordinarily used for pasture in the fall. The next season a large yield of hay is obtained (one to three or more tons per acre, according to the fertility of the soil), but the

yield decreases thereafter to such an extent that the best farmers do not attempt to maintain a timothy meadow for more than two seasons, though such fields are frequently used for pasture for two or three years longer, before breaking them up for corn. In the latter case, bluegrass seed (*Poa pratensis*) is frequently scattered on the timothy sod, so that the pasture consists largely of bluegrass. The production of timothy hay is confined largely to the region north of and including the eastern third of Kansas and Nebraska, and to certain restricted localities in the Rocky Mountains and Pacific Coast States; but timothy hay is used almost exclusively by horsemen in the large cities of all sections of the country.

**Kentucky Bluegrass, June Grass or Bluegrass (*Poa pratensis*).**—Next to timothy this is the most important grass in this country, though it seldom grows large enough to cut for hay. It is undoubtedly the leading pasture grass in America. Its distribution is nearly identical with that of timothy. It does not extend south of the Ohio River except in a circular area about 100 miles in diameter in Kentucky, with a point 25 miles north of Lexington as a centre; and in certain portions of Tennessee and the mountainous portions of the Southern States. In Kentucky and Tennessee its distribution is closely confined to the Cambrian rocks, which are rich in both lime and magnesia. Perhaps no other grass is so acceptable to stock as bluegrass. It is one of the most nutritious of grasses, and it is a notable fact that stock raising has never become a prominent feature of farming anywhere in the United States outside of the bluegrass region, except of course in the range country of the West, where ranching rather than farming is the prevailing form of agriculture. The best bluegrass pastures are those which are kept free from weeds and bushes, not cropped too closely and constantly, and upon which fattening stock are fed grain and mill products. Such pastures last indefinitely, but are hardly productive enough to justify their maintenance except on rough lands not well adapted to the cultivation of ordinary crops. So highly prized are the bluegrass pastures in many sections that they are seldom broken up; for it is a difficult matter to establish a good bluegrass pasture, a process requiring several years.

**Millet.**—The term millet is applied to three more or less distinct groups of grasses. The more common millets in this country are the foxtail millets (*Chenopodium*). They include the well-known foxtail, a common weed springing up in grain fields after harvest, and the hay-producing varieties, Hungarian grass, German millet, golden millet and a few others, all annuals which produce an abundant crop of coarse hay of rather inferior quality. They are grown mostly as catch crops, being sown in late spring and early summer on fields where other crops have failed because of drouth. They are hence confined largely to the semihumid region extending from North Dakota to Texas. Millet hay, when fed to horses that have no other roughness, has the peculiar property of producing acute rheumatic affections of the joints; but when fed with other hay, the damage from this source is very slight. Another group of millets, frequently called broom-corn millets, are varieties of the species *Panicum*

*miliaceum*. These are little known in this country, though they constitute important bread-producing crops in central Asia. A third kind of millet, usually known as Japanese millet, is a variety of the common barnyard grass, *Panicum crus-galli*. Some forms of this grass are common weeds all over this country. Some of the varieties produce large crops of coarse but palatable hay, particularly on wet lands in the Southern States. The seed of one variety is used for food by certain Indian tribes of the Southwest. Other varieties are similarly used in the Old World. This group of millets probably deserves more attention than it has yet received in this country.

**Redtop (*Agrostis alba*).**—This grass and its variety *vulgaris* are widely distributed in this country, occupying the whole of the timothy and bluegrass region and extending considerably farther south; but the only section in which it may be said to hold first place is in a limited area in southeastern Illinois and adjacent parts of Kentucky. In this section, practically all of the redtop seed of the country is produced. It is rather distinctly a wet-land grass, and is usually a valuable constituent of meadows and pastures on moist lands in all parts of the country except the extreme South. It is also well adapted to the acid soils of the Atlantic seaboard, where it is frequently used in meadow and pasture mixtures. In yield of hay it is distinctly inferior to timothy, but it withstands cropping and trampling by stock much better. Although quite nutritious, it is not nearly so well relished by stock as timothy or bluegrass.

**Orchard Grass (*Dactylis glomerata*).**—In its distribution in this country, this grass is identical with redtop, but it is adapted to drier soils. Particularly in the southern portion of its area, orchard grass flourishes in the shade of trees, hence its popular name. It may be said to be important as a hay grass only in that part of its range which extends beyond the limits of the timothy region. It is particularly important in the clay soils around the base of the Appalachian range from Virginia southward, though it thrives equally well throughout the timothy region. This grass produces a large yield of rather coarse hay, which, however, is of excellent quality if cut by the time the blossoming period is over. If allowed to stand longer, the quality of the hay deteriorates rapidly because of the formation of woody tissue in the stems. A rather serious objection to it is that it is inclined to grow in bunches, making a rough and uneven surface difficult to mow; yet it is undoubtedly the best of the hay grasses in those portions of its region where timothy does not succeed. It is also an excellent pasture grass, withstanding much hard usage, and furnishing large quantities of herbage. In New Zealand, where this grass is very popular, and in England, it is known as cock's-foot, from the fancied resemblance of its branching seed-head to a chicken's foot.

**Bermuda (*Cynodon dactylon*).**—With some reservations, it may be stated that what bluegrass is to the North, Bermuda is to the South. The differences are: Bermuda revels in the heat of summer, while bluegrass makes little growth in hot, dry weather. It stands drouth much better than bluegrass. On good

land, Bermuda furnishes good crops of hay, which bluegrass does not. Bermuda stands trampling even better than bluegrass, and yields more pasture. On the other hand, Bermuda furnishes pasture only during the warm season; and while it furnishes larger amounts of feed than bluegrass, stock do not relish it quite so well. The seed of Bermuda is also quite unreliable and very high-priced, so that, to ensure getting a stand of it, it is the usual custom to plant small pieces of sod, which soon spread over the ground and form a complete covering. One of the most characteristic features of Bermuda is its habit of sending out long runners which run along the surface of the ground, taking root at the joints. This renders it a matter of considerable difficulty to eradicate the grass when it is once established. But this may be done by growing densely shading crops, such as oats in winter, followed by cowpeas or velvet beans in summer, for one or two seasons. A single season of clean culture, such as cotton receives, will then completely destroy the Bermuda. It may also be destroyed by plowing very shallow in midsummer, followed by sufficient harrowing to prevent further growth before winter. *Saint Lucie Grass* is a variety of Bermuda which is found in Florida and near the Gulf Coast. It grows considerably larger than the species, and is said to remain green longer in the fall.

**Johnson Grass or Means Grass (*Sorghum halapensis*).**—This grass was introduced into South Carolina from Turkey near the middle of the last century. In that State it is generally known as Means grass, from Governor Means, who did much to popularize it. It was later taken to Mississippi by a Mr. Johnson, where it became widely known under his name. The most prominent characteristic of Johnson grass is its habit of producing an enormous growth of underground stems (rootstocks, or rhizomes), from each joint of which a new plant may be produced. It is therefore a matter of extreme difficulty to get rid of the grass when it is once established. It is now very generally distributed over the cotton-producing States, and is the most formidable weed found in the South. It is generally believed that it cannot be exterminated by any practicable means. This, however, is not the case. The rootstocks, which make this plant a formidable weed, begin to be formed just as the plant blossoms. If the grass be cut for hay at this time, its energies are then diverted to making growth above ground, the growth of the rootstocks being checked. A second crop of hay may be cut when the plants blossom again. Immediately thereafter the land should be plowed very shallow, and then harrowed frequently to prevent further growth till winter. The rootstocks formed the previous year will not survive a second winter, so that land treated as above described will be free from Johnson grass the next year.

While Johnson grass produces rootstocks in abundance, it spreads very slowly by this means, but spreads rapidly by seed. These are produced in great quantity, are readily eaten by stock and are thus carried over all parts of a farm on which it has once gained a foothold. Johnson grass usually gives three cuttings of hay in a season, of about a ton each on good land. The hay is of excellent quality, particularly for cattle and for all horses except livery

horses liable to be subjected to hard driving after a full feed. In such cases its laxative and diuretic effect becomes objectionable. As a pasture grass it cannot be compared with Bermuda, though it is greatly relished by all kinds of stock. It is soon killed down completely when heavily pastured, but when the land is plowed it springs up again.

**Sudan Grass.**—This is closely related to Johnson grass, which it resembles in all respects except two. It is an annual and it has no rootstocks. It has recently been introduced into this country from Africa, and is becoming an important hay grass in localities where better grasses are wanting.

**Brome Grass (*Bromus inermis*).**—This is a recent introduction from east central Europe, and on the prairie soils of the Northwest and the Pacific Northwest it occupies the place that bluegrass holds on the glacial drift of the more humid climate to the East. It is much larger than bluegrass, and hence furnishes more feed. It is much relished by all classes of stock. Stock eat with great avidity the straw from which seed is harvested, and the hay, cut just after the blossoms fall, is of excellent quality. Brome grass forms an excellent sod.

**Italian Rye Grass (*Lolium italicum*).**—This is perhaps the most important of all the meadow grasses in England and on the continent of Europe. It is relished by stock better perhaps than any other of the cultivated grasses; yet, for some reason not entirely clear, it is almost unknown in America. The only section of the country in which it has gained favor is in northwestern California, western Oregon and western Washington. It is adapted to a very wide range of soils. It thrives remarkably on land reclaimed from salt marshes by dyking, and it is also a valuable grass on upland soils that are inclined to be dry. Practically speaking, it is an annual, but if properly managed it reseeds itself in such a manner as to be practically a perennial. It is a valuable constituent of all pasture mixtures, and is a hay grass of much value. It is not well adapted to single culture, being rather too weak of stem to stand alone.

**English Rye Grass (*Lolium perenne*).**—This differs from the last in no essential respect except that it does not grow quite so tall, and is slightly more inclined to a perennial habit. It is an important European grass practically unknown in America.

**Tall Fescue and Meadow Fescue (*Festuca elatior* and variety *pratensis*).**—These two grasses differ in no essential particular (from the agriculturist's standpoint) except that the first is taller and more leafy than the second, and therefore more valuable as a forage plant. The smaller form is frequently known as English bluegrass, a name which has led to much confusion, and which should be abandoned. It is not closely related to our Kentucky bluegrass, nor to Canadian bluegrass (*Poa compressa*). Tall fescue is much confused with meadow fescue by seedsmen, and it not infrequently occurs that seed of the latter is sold under the name of tall fescue. This fact has hindered the recognition of the decided merits of tall fescue. Next to Italian and English rye grass, these two grasses are the most important cultivated grasses in Europe. But like the rye grasses, they have never

been recognized as valuable grasses in this country except in a few restricted localities. One of these localities is western Missouri and eastern Kansas.

**Tall Oat Grass (*Arrhenatherum avenaceum*).—**This grass is found occasionally in all parts of the country, but is nowhere an important crop. Stock do not eat it readily at first, but soon become accustomed to it, and then eat it freely. It has considerable value both for hay and for pasture. Its seed drops promptly when ripe, and is thus very difficult to save.

**Cheat, or Chess (*Bromus secalinus*).—**In the Central and Eastern States, cheat is a pernicious weed in wheat fields, and it is popularly believed that, under certain unknown conditions, wheat turns into cheat, and it avails nothing that the fallacy of this notion has been demonstrated time and time again. In some parts of the South, and in the Willamette Valley in Oregon, cheat is sometimes grown for hay. It produces a large yield of rather poor hay. Being an annual, it is of little value for pasture.

**Velvet Grass (*Holcus lanatus*).—**This grass is common in the Pacific Coast region along roadsides and in waste places. On sandy soils along the coast and on peaty soils that dry out in summer, velvet grass is perhaps the most profitable hay and pasture grass, because the better grasses do not succeed. Stock usually refuse to eat it until driven by hunger, but they will soon acquire a taste for it, and it is exceedingly nutritious. Its worst faults are its low yield and lack of palatability.

**Canadian Bluegrass (*Poa compressa*).—**A grass of small economic value, found quite generally over the Northern States and in Canada. It is of some value as a sand binder, and, when kept closely mowed, it forms a smooth, even sod in lawns. In parts of Virginia and States to the north it is valued as a pasture grass on sandy loam soils.

**Crab Grass (*Panicum sanguinale*).—**This is not, strictly speaking, a cultivated grass. It springs up in cornfields, and after small grain crops in late summer, and frequently furnishes a considerable crop of hay, which is of fair quality. It is universal in the South and extends northward to the Missouri and Ohio rivers.

**Fodder Grasses.**—Under this term we may include the coarse-growing grasses such as the sorghums, Kafir corn, Milo maize, teosinte, etc. On account of their large size, they require to be handled in a different manner from the common hay grasses. They are usually cut and shocked after the manner of fodder corn, though most of them may be handled by haying machinery if they are sown quite thick.

The sorghums (saccharine sorghums) were introduced into this country about the middle of the last century, and were extensively grown for syrup making before the now universal adulteration of this class of food materials destroyed the market for all farm-made syrups. At present little sorghum syrup is produced, but the sorghum plant is much grown for fodder. Its most valuable characteristic is its ability to withstand protracted drouth. It is therefore especially adapted to the western edge of the humid region, where it is exceedingly

popular. Sorghum is also very generally grown in all the Southern States, where the fodder is particularly valuable as a feed for the plantation mules. In all the cotton-growing States, as well as along the edge of the great plains, sorghum is a much more certain crop than corn (maize). Kansas is the leading State in the production of this crop. Some varieties are grown as far north as Minnesota and North Dakota. In the South two or three cuttings may be made in a season.

Several varieties of Kafir corn (non-saccharine sorghums) have become established in this country in recent years. The plant resembles a low-growing, branching, very leafy sorghum. It is cultivated either for fodder or for grain, of which latter it yields abundant crops. The grain is inferior to corn, but its more certain yield in dry seasons renders it a valuable crop in the same sections where sorghum is grown. It is rather more distinctly a southern crop than sorghum, being grown most largely in Kansas, Oklahoma, Texas and New Mexico. Milo maize is not very widely known in this country, but it is gaining a foothold in parts of Texas, where it is grown after the manner of sorghum and is said to furnish large crops of valuable fodder or hay. Teosinte (*Euchleena mexicana*) is a tropical plant somewhat resembling sorghum, but in reality more closely related to corn (maize). It does not produce seed in this country, but on rich alluvial soils in the Southern States it produces enormous yields of green fodder much relished by cattle. It is of no account on poor thin soils. Near the cities, where dairying is an important industry, this crop is of great value in the South. It may be cut several times in a season, and there is no waste in feeding it, as the stalks are readily eaten.

Pearl millet may be classed with the sorghums on account of its manner of growth, but botanically it is quite different from them. It is a native of Africa, and was introduced in this country about 30 years ago. It has been tried very generally over the country, but has never gained favor. The seed is frequently unreliable, and the stems are inclined to be woody when approaching maturity.

A large number of our wild grasses have more or less economic importance. In fact, a majority of them furnish food for domesticated animals, while some are important for other reasons, as will appear in the discussion below. Only a few, however, are of sufficient importance to warrant their mention here. It is somewhat remarkable that none of our wild grasses have been domesticated during the past hundred years. This is perhaps due to the fact that the best of them were brought into cultivation very early in the history of the country. The more important genera of our wild grasses are:

**Andropogon.**—This genus is particularly well developed along the eastern edge of the Western plains, where several species form important constituents of the immense acreage of wild hay cut in that region; also in the Southern States, where it constitutes the major part of the growth of grasses in open woods and abandoned fields. *A. virginicus* is one of the most abundant grasses from Maryland southward. These grasses are large and coarse, and are not much relished by stock except in the early stage of their growth, whence the common practise

of burning over the prairies to start a new growth of tender grass.

**Agropyron.**—This genus is particularly characteristic of the northern Rocky Mountain States, where several species are valuable for forage. They are, as a rule, better relished by stock than the preceding, and some of them furnish hay of excellent quality. *A. occidentale* is the well-known blue-stem of the mountain regions and the western margin of the plains. It has strongly creeping rootstocks and is perhaps the best hay grass among the wild species in the region where it grows. There is reason to believe that it will in time constitute an important crop on cultivated lands, particularly in the moister valleys of the northern portion of the arid region. *A. divergens* is the common bunch grass of eastern Washington and Oregon and northern Idaho. It is valuable on the ranges and furnishes very good hay where the rainfall is 20 inches or more. *A. repens* is the well-known quack grass of our Northern States. On account of its great development of rootstocks it is a very pernicious weed. Yet it furnishes fairly good forage and is recommended by some for cultivation in the semi-arid region. It also has some value as a sand binder. It may be eradicated by methods similar to those described under Johnson grass. *A. tenerum*, the slender wheat-grass of the Northwestern prairies, is a good hay grass, seed of which may now be had on the markets.

**Ammophia.**—A genus of one species, known as beach grass; in Australia and South Africa called "marram." This is as yet the only species of grass that has been used successfully in northern latitudes as a sand-binding grass on dunes near the coast. For this purpose it is invaluable. Extensive plantations of it have been made on both the Atlantic and Pacific coasts; also on dunes near the Great Lakes. It is propagated by digging up bunches of the grass, separating each one into several small bunches and then resetting them in the sand.

**Arundinaria.**—The cane of the Southern cane-brakes, a relative of the Oriental bamboos. It is much utilized as winter forage for cattle, which frequently winter in good condition in the brakes. There are two closely related species, the larger one furnishing the common cane fishing rods.

**Avena.**—*A. fatua*, the wild oats of the spring-wheat producing States, is a weed in wheat fields. In several States the common hay is cut from patches in wheat fields taken by wild oats. If cut early enough the hay is of fair quality. Wild oats form an important constituent of the forage on the ranges of portions of the State of California.

**Bouteloua.**—This is one of the most characteristic genera of the arid regions of America, particularly in the Southwest. Side oats grama (*B. curtipendula*) is a handsome and valuable grass on the plains, where it furnishes much valuable feed. Blue grama (*B. oligostachya*) is the buffalo grass of the plains of eastern Montana, and is also a valuable forage plant.

**Bulbilis.**—Buffalo grass (*B. dactyloides*) is probably the most valuable wild grass of the plains region, extending from the Dakotas and Montana to southern Texas and New Mexico. It is one of the most nutritious grasses, rivaling Kentucky bluegrass in this respect, but is less productive than the latter. In Texas and else-

where there were formerly vast areas of buffalo grass forming a compact sod; but owing to overstocking and the depredations of prairie dogs, the grass is now much less in evidence. It is not well adapted to use on cultivated land because of its poor seed habits.

**Calamagrostis.**—An important genus along the northern border of the United States. Blue-joint (*C. canadensis*) is an important constituent of swamp hay, of which a large acreage is cut in Minnesota, Iowa and adjacent States.

**Cenchrus.**—Two species of *Cenchrus* are found in sandy soils in the South and West. They are noted for the hard spiny "burs" in which the seed are found. They are known as "sand burs," and are pernicious weeds in sandy soils.

**Setaria (Chaetochloa).**—The foxtail grasses. Two species, the yellow foxtail and green foxtail, are useless weeds which spring up in wheat fields after harvest.

**Distichlis.**—Salt grass (*D. spicata*) is common in salt water marshes on the coasts and on alkali soils in the arid regions. It has some value as a forage plant.

**Elymus.**—This is a large and important genus. Several representatives are widely distributed and some possess considerable value as forage plants. *E. condensatus* (giant rye-grass) is a very characteristic grass in lowlands in the arid regions, where it grows in large clumps, attaining a height of six or seven feet. While not greatly relished by stock, it frequently suffices to sustain life during periods when other grasses are covered by snow. It has been sown on cultivated land in some irrigated lands of the West, particularly where alkali has begun to appear, and it furnishes large crops of hay. This hay is rather too laxative for horses, but is said to make good feed for cattle. *E. triticoides* (wild wheat) is found in great abundance on wet meadows in eastern Oregon and adjacent regions, where it is frequently cut for hay. The forage is said to be excellent. *E. canadensis* is a very variable species, common throughout the Central and Northern States. Some forms of it are characterized by strongly developed rootstocks and thrive in the sandiest soils. It probably has considerable value for holding embankments in places where the soil is sandy. It is also a good forage grass and is worth more attention than it has yet received for this purpose in the semi-arid region.

**Festuca.**—One of the characteristic genera of the Western States. *F. ovina* (sheep's fescue) is one of the most abundant and most valuable grasses of the ranges in the mountain regions.

**Hordeum.**—Squirrel-tail grass (*H. jubatum*) is common on the plains of the West, particularly in the north. When young and tender it is eaten by stock. When mature, its rough beards are often injurious to stock; they penetrate into wounds in the mucous membrane of the mouth and into crevices in broken teeth and often cause the death of horses and cattle. *H. murinum*, a species found on the Pacific Coast, has barbed beards which penetrate the skin of young animals. It is most pernicious pest.

**Muhlenbergia.**—A genus particularly well developed in the South, where several species of it are usually found in moist or shady places. Nimble Will (*M. diffusa*) is one of the commonest species. A genus of no particular value.

**Panicularia.**—Four species of *Panicularia* are common swamp grasses of the Northern States. They are all excellent forage grasses, but are little utilized, since they seldom grow in situations that permit them to be harvested.

**Panicum.**—One of the largest and most important genera of grasses in the United States, particularly prominent in the Southern States. Several species have already been noticed in the list of tame grasses above. These are crab grass, Colorado grass, Japanese millet and the broom-corn millets. The most prominent remaining species are: *P. amarum*, a grass with long creeping stems, common on sands near the coast from Connecticut to Florida and along the Gulf Coast. This species is of considerable value for holding drifting sands. *P. capillare*, Old Witch grass, tickle grass, an annual with widely branching panicles, common and sometimes troublesome as a weed in cultivated ground. *P. maximum*, Guinea grass, introduced into Florida from the tropics. A valuable fodder plant, furnishing several cuttings in a season, sometimes confused with Johnson grass, but much less hardy. *P. proliferum*, sprouting crab grass, growing in much the same region as crab grass, but extending farther northward. It springs up in cultivated fields in late summer and is occasionally utilized as pasture or hay. *P. virgatum*, switch grass, ranging from Maine to the Gulf and westward to the Rocky Mountains. It is a perennial, three to five feet high, and, if cut very early, furnishes a large yield of fairly good hay. It deserves attention as a hay and pasture grass in semi-arid regions.

**Paspalum.**—Another large and important genus. Seeds usually in digitate spikes resembling those of crab grass. Carpet grass (*P. compressum*) is a valuable pasture grass near the Gulf Coast, particularly on sandy soils. On such soils it will even drive out Bermuda when closely pastured. Its spreading stems form a dense carpet-like growth which gives it its popular name of "carpet grass." Water grass (*P. dilatatum*) is another common grass in all the Southern States, frequently found in wet lands. Its seed has recently been placed on the market and it is used to some extent as a hay and pasture grass. Knot grass (*P. distichum*), with creeping stems, is also common in the South, where it is frequently mistaken for Bermuda, which it closely resembles. Said to be valuable on wet lands as pasture.

**Phalaris.**—One of the species of this genus (*P. arundinacea*), known as "reed canary" grass, is one of the most thoroughly cosmopolitan species in this country. It is found all over the country, usually on wet or overflowed land, but frequently on uplands as well. It is a perennial with creeping rootstocks (underground stems) growing four to six feet high. Few grasses are better relished by stock, either as hay or as pasture; and, were it not for its habit of shedding its seeds the moment they are mature, it would undoubtedly have become an important cultivated grass long ago. *P. canariensis* is the well-known canary grass, seed of which is commonly used as food for canary birds.

**Poa.**—This is one of the most characteristic genera of this country, some representatives of it being well-nigh universal, except in the far South. Kentucky bluegrass, the June grass of the Northern States, one of the most important

grasses in America, has been fully discussed under the tame grasses above. Many varieties of this species are found in the wild state in the Northwest, where it is of great importance as a range grass. Even in the region of its greatest importance it is a semi-wild plant, springing up everywhere from seed scattered by the wind or by stock. It is the finest pasture grass in the world, but not the most productive. *P. annua* is another representative of the genus found all over the country. It is particularly common in the South and on the Pacific Coast, where it remains green during the entire winter. This species is not native here, but is fast becoming one of our commonest grasses. It is frequently found in lawns and in cultivated grounds. It seldom attains a height of more than a few inches. Texas bluegrass (*P. arachnifera*) is noted for the cottony appearance of its seed. It is also a valuable grass for winter pasture in the South, but is somewhat difficult to establish in a pasture. Like Bermuda, it is usually propagated by setting small pieces of the sod a foot or two apart each way. It is a native of Texas, but is nowhere very abundant. Many species of *Poa* are found in the far Northwest, where they are important range grasses. *P. levigata* is frequently cut for hay on wet meadows in the mountain regions of Oregon and Washington.

**Savastana.**—Vanilla grass (*S. odorata*), commonly called "sweet grass" in the Northwest is found from New England to Oregon and Washington. It is noted for its strong vanilla-like odor, resembling the odor of sweet vernal grass. The dried leaves are used by the Indians in weaving small mats and boxes, in which condition they retain their characteristic odor.

**Spartina.**—Cord grass (*S. cynosuroides*) is an important constituent of the swamp hay of which large quantities are cut in Minnesota, Wisconsin and Iowa. It is frequently found in large areas growing alone, as if it had been sown there by hand. The hay is of fair quality and the yield large.

**Sporobolus.**—Another characteristic genus of the West and Southwest, where several species are important on the ranges. Saccaton (*S. wrightii*) is common in Arizona and New Mexico, where it grows in large clumps and is frequently cut for hay. Although decidedly coarse, the hay is valued as forage. Dropseed (*S. cryptandrus*), common on the Western plains and in the Rocky Mountains, is much relished by stock.

**Stenotaphrum.**—A single species, *S. dimidiatum*, is of importance. It is frequently used as a lawn grass from Charleston, S. C., southward. Sometimes called Charleston lawn grass and Mission grass. This is the pimento grass of Jamaica. In New South Wales it is called buffalo grass. It grows on all kinds of soils, from heavy clay to almost pure sand, but is seldom found far from the seashore.

**Stipa.**—A large and important genus in our western flora. Several species are remarkably long-awned on the flowering glumes, giving them the popular designation of needle grasses. Some of them have the lower end of the seed produced into a hard, sharp joint which frequently penetrates the skin of animals, rendering these species somewhat of a nuisance to stockmen. Many of them, however, make ex-

cellent hay on the great plains. *S. leucotricha* is the bearded mesquite of central and southern Texas, a valuable wild hay grass. *S. vaseyi*, found in the Rocky Mountains at altitudes of 5,000 to 6,000 feet, has the peculiar property of inducing sleep in stock that eat it, for which reason it is known as "sleepy grass." No harm, further than a desire to sleep, seems to follow a feast on this grass; the effects wear off gradually in a day or two.

**Uniola.**—One species (*U. latifolia*) has large panicles of broad, drooping spikelets, rendering it exceedingly graceful. It is used as an ornamental, and is indeed one of the most beautiful of the grasses. It is found from Pennsylvania westward to Illinois and southward. *U. paniculata*, seaside oats, grows abundantly on the sands of our southern Atlantic coast and on the Gulf coast where it serves as a sand binder.

**Zizania.**—Wild rice; Tuscarora rice. Wild rice (*Z. aquatica*) is one of the most striking in appearance of any of the American grasses. It occurs on mud flats almost all over the country. It is very abundant on the tide flats of the Delaware and Potomac rivers, as well as in many other places, both in the United States and Canada. A field of it in bloom presents a very pleasing appearance with its large, graceful panicles, yellow below with a great wealth of staminate flowers in drooping branches of the panicle, the upper, pistillate branches rising gracefully at various angles. When found in situations that permit it to be harvested, Indian rice is cut for forage, yielding enormous quantities of succulent feed, much relished by stock. The seed is gathered in quantity for food by Indians in the Northern States and in Canada. It is frequently planted in mud or shallow water for its seed, of which fish and birds are exceedingly fond. The seed is gathered in boats, into which it is threshed from the tall stems growing in water. The seed keeps best under water.

**Ornamental Grasses.**—A number of valuable ornamental grasses have been mentioned above. A few others deserve notice. Reed (*Arundo donax*) is found in dooryards in nearly all parts of the country, particularly in the South, though it thrives quite well at the North. It frequently attains a height of 15 feet or more. It resembles sorghum, but is more leafy and more graceful in appearance. It is a perennial, springing up in early spring from the roots. As a background for smaller ornamental plants it is invaluable. Many of the bamboos are exceedingly useful as ornamental plants. Only a few species are adapted to northern latitudes. A garden variety of *Phalaris arundinacea* is common in this country under the name of ribbon grass. Its leaves are striped with white. There is also a similar striped variety of reed. *Coix lachryma-jobi*, Job's tears, is a small to medium-sized grass frequently found in gardens and dooryards; it is noted for the indurated, tear-shaped covering of the seed. *Eulalia japonica* of the Orient, *Erianthus ravenna* (Ravenna grass) of Italy and *Gyncrium argenteum* (Pampas grass) of the Argentine pampas are other well-known and deservedly popular ornamental grasses.

W. J. SPILLMAN,

Chief, Office of Farm Management, United States Department of Agriculture.

**GRASSHOPPER-FROG, or CRICKET-FROG**, a small, agile, noisy frog (*Acris gryllus*), common throughout the warmer half of the United States, whose spring cry is like the rattling produced by striking rapidly two resonant pebbles. It is about an inch long, brown with a blackish triangular patch on the back of the head and a dorsal stripe. Its eggs are attached in little masses to a blade of marsh-grass.

**GRASSHOPPERS AND LOCUST-PLAGUES.** Insects of comparatively large size of the orthopterous families *Acrididae* and *Locustidae*, or short-horned and long-horned grasshoppers respectively. In Great Britain and her colonies the former are the "locusts" of popular speech and only the *Locustidae* are called "grasshoppers." (For the allied family of crickets, see GRILLIDÆ.) The *Acrididae* have the antennæ shorter than the body and blunt, the ovipositor short and its parts divergent at the tip and the sound-producing organs (see ORTHOPTERA) on the hind thighs and outer edge of the forewings. In the *Locustidae* the antennæ are long and tapering, the ovipositor long and sword-like and the sound-organs are at the inner base of the forewings. This latter family embraces the katydids, tree-crickets, green meadow-grasshoppers and certain Western species erroneously called "crickets" and the group is more particularly treated under KATYDID. In both families the hinder legs are greatly enlarged, enabling the insects to make the long leaps so characteristic of them; their wings are also capable of carrying them in some cases many hundreds of miles.

The short-horned grasshoppers are those of greatest interest economically and those responsible for the "locust" plagues of Africa, Arabia and southern Asia, as also in our West. From time to time vast bodies of certain species sweep from one region to another in swarms many square miles in area and so dense as to darken the sun, feeding on grasses and herbage and consuming not only crops and pasture as if by fire, but stripping bushes and trees of foliage and even of the bark. In the ancient world such visitations, which frequently extended into central Europe, caused extensive local famines, sometimes resulting in the loss of hundreds of thousands of human beings and vast numbers of grazing animals. Such "plagues" lasted for two or three years, the hosts breeding numerously at first, but gradually dying out and ceasing to reproduce outside the limits of their permanent breeding-grounds. The reproduction of grasshoppers consists in the deposit in autumn of eggs laid in bunches, covered with a secretion which hardens into a case or "pod," beneath the surface of the ground, into which the ovipositor is deeply thrust and where the eggs remain to be hatched the following spring; in warm countries, however, two generations may take place annually. The locusts referred to in Scripture belonged probably to the species now named *Schistocerca peregrina*, of North Africa and Arabia. The swarms which from time to time appear in South Africa are of *Pachytelus migratoroides*; while *P. migratorius* is the best-known one of southern Europe and Asia. Similar species inhabit the open interior regions of both North and South America, a species of *Acridid* afflicting Argentina.

Of the many species in the United States

those of the genus *Melanoplus* are of greatest interest because frequently destructive of crops. The most conspicuous is *M. spretus*, the Rocky Mountain locust, which has been a scourge of agriculture west of the Mississippi River ever since settlements began there. Among the more recent great plagues were those of 1856 and 1874, the latter enduring three years and causing widespread ruin throughout the whole region between the Mississippi River and the Rocky Mountains. The Federal government appointed a commission of entomologists to investigate the habits of the insect and its three 'Reports' (1877, 1879 and 1882) are exhaustive essays on the subject. It was found that these and other destructive locusts bred throughout the whole plains region in the river bottoms and sunny depressions and that little could be hoped for in defense except the gradual effect of cultivation in destroying the eggs and young by late and early plowing. This effect has been gained with unexpected celerity; and troublesome grasshoppers now breed in considerable numbers only in northern Idaho and central British Columbia. Swarms occasionally migrate and do damage, but the extensive plagues of the past will probably not recur. Nevertheless, grasshoppers are likely often to be locally harmful in the West and must be combated intelligently. The most valuable preventives are the burning over or deep plowing of breeding grounds, so as to turn the eggs out and kill them in the fall or before they can hatch in the spring. The grasshoppers themselves may be captured by means of "hopper-dozers" or kerosene pans. A cheap destroyer consisting of one part of Paris green thoroughly mixed in 60 parts of fresh horse-dung, two pounds of salt to half a barrel of the mixture being added, after being dissolved in water. This mixture is scattered broadcast along the edges of crops where infestation is feared and the locusts, liking and eating the poison, die a few days later. The ordinary bran-arsenic mixture for cut-worms may also be used and in some regions wheat fields are protected by a trap-crop of rye sown in a strip around the fields and poisoned by spraying with Paris green.

**Bibliography.**—Sharp, 'Insects' (Vol. VI, Cambridge Natural History 1900); Howard, 'The Insect Book' (1901); Hyatt and Arms, 'Insecta' (Boston 1890); Kellogg, 'American Insects' (New York 1908); Fabre, J. Henri, 'The Life of the Grasshopper' (1916), and publications of the United States Department of Agriculture, especially Bulletin 25, Division of Entomology.

**GRASSQUITS**, a group of interesting little seed-eating finches of the West Indies, belonging mainly to the genus *Sporophila*, and flocking in grassy lands and pasturage.

**GRATIAN, or GRATIANUS FRANCISCUS**, Benedictine writer of the 12th century. He was a native of Chiuse and is considered the founder of the science of canon law. He was the author of a famous work entitled 'Decretum; or Concordia discordantium Canonum,' in which he endeavors to reconcile those canons that seem to contradict each other. It is a rich storehouse of the canon law of the Middle Ages. The best edition of the text is found in the 'Corpus Juris Canonici' of Richter (1833-39).

**GRATIAN, or GRATIANUS**, grā-shi-ā'nūs, Roman emperor, eldest son of the Emperor Valentinian; b. Sirmium, Pannonia, 359 A.D.; d. Lyons 383. When only eight he was raised by his father to the rank of Augustus. On the death of Valentinian in 375 the eastern part of the empire still remained subject to Valens and Gratian was obliged to share the western part with a half-brother, a child of four years, associated with him under the title of Valentinian II. In the early part of his reign the Goths and Alemanni made incursions into the Danubian provinces and into Gaul. They were repeatedly defeated by Gratian and his generals, but they also advanced into the Eastern empire and defeated and killed Valens in 378. Gratian then bestowed the Eastern empire upon Theodosius, one of his generals.

**GRATIOLA**, grā-tī'ō-lā, a genus of scrophulariaceous plants with many species widely distributed in temperate regions. A notable representative is the European hedge-hyssop (*Gratiola officinalis*), which is extremely bitter, acts violently as a purgative, diuretic and emetic and in overdoses is an acrid poison. It was formerly highly esteemed as a medicine, and its virtues were supposed to depend on a bitter resinous principle called "gratolin." Several species are natives of North America.

**GRATTAN, Henry**, Irish orator and statesman; b. Dublin, 3 July 1746; d. London, 4 June 1820. He was called to the Irish bar in 1772, and in 1775 was elected member for Charlemont in the Parliament of Ireland. He immediately became distinguished in the opposition, and infused that spirit into the country which produced in 1782 a repeal of the statute of the 6th George I, which had enacted that the crown of Ireland was inseparably connected with that of Great Britain; that Ireland was bound by British acts of Parliament when named therein; that the Irish House of Lords had no jurisdiction in matters of appeal; and that the last resort in all cases of law and equity was the British House of Lords. For his share in the acquirement of this concession the Irish Parliament voted him £50,000 to be laid out in the purchase of a house and lands for him and his heirs forever. He became the leader of the country party in the House of Commons and the head of the Irish Whigs. Disgusted by the Irish Rebellion and its manifold horrors, he temporarily withdrew from Parliament, but the project of a union being brought forward by Pitt, he once more obtained a seat in Parliament for the purpose of opposing it. When it was carried, however, he did not refuse a seat in the United House of Commons, being returned in 1805 for Malton in Yorkshire, and in the following year for Dublin. His later years were chiefly occupied in a warm and energetic support of Catholic emancipation. Grattan was the zealous friend of Ireland from first to last. As a public speaker he had to contend with a defective voice; but his eloquence was bold and commanding, combining strength with beauty and energy and elevation with elegance. The best collection of Grattan's parliamentary speeches is that edited in 1822 by his son Henry, who also wrote an account of his 'Life and Times' (1839-46). Consult Lecky 'Leaders of Public Opinion in Ireland' (1871); Mc-

Carthy, 'Henry Grattan' (1886); Dunlop, 'Henry Grattan' (1889).

**GRATTAN-FLOOD, William H.**, Irish organist and author: b. Lismore, 1 Nov. 1859. He was educated at Mount Melleray, All Hallows College, Dublin, Carlow College and the Catholic University of Ireland. He has been at various times theological student, tutor, professor of music and languages and lecturer on Irish history. He was professor of music at the colleges of Tullabeg and Clongowes Wood, served as organist in various Irish churches and since 1895 has been organist and choir-master at the cathedral of Enniscorthy. He was lecturer at the Mangan and Balfe centenaries in 1903 and 1908 respectively and was president of the music section of the Pan-Celtic Congress held at Brussels in 1910. He was historical witness at the process for beatification of the Venerable Oliver Plunkett, archbishop of Armagh. He is a member of the Royal Society of Antiquaries of Ireland and of the International Musical Society. His published works include 'History of Irish Music'; 'Story of the Harp'; 'Story of the Bagpipe'; 'Mémorial of W. Vincent Wallace'; 'Mémorial of Father James Dixon.' He edited 'Moore's Melodies'; 'Spirit of the Nation'; 'The Armagh Hymnal' and was joint editor of 'De Annatis Hiberniæ'; 'The Papal Registers' and collaborated in Grove's 'Dictionary of Music,' 'Dictionary of National Biography'; 'The Catholic Encyclopedia,' etc.

**GRATZ, Rebecca**, American educator: b. Philadelphia, 4 March 1782; d. Philadelphia, 27 Aug. 1869. Of a family noted for wealth and culture, she showed her bent of mind by founding in 1838 in Philadelphia the Hebrew Sunday-school, the oldest society of its kind in America, and for 32 years she was at its head. Apart from her labors in behalf of the Jewish poor and needy, she was quick to respond to the claims of charity without regard for creed, and she was long regarded as Philadelphia's representative Jewess for her simple piety, personal charm and social standing. Her name will always be associated with Scott's 'Ivanhoe,' for once when Washington Irving was visiting Sir Walter Scott and learned that a Jewess was to be introduced in the latter's novel, then in course of preparation, the American described Rebecca Gratz with so much warmth—that Scott was deeply impressed. When 'Ivanhoe' was finished he sent the first copy to Irving with the inquiry whether the "Rebecca" of the romance compared favorably with the real Rebecca.

**GRATZ COLLEGE**, Philadelphia, a Jewish institution of higher learning, founded under a deed of trust by Hyman Gratz (1856), vested in the Congregation Mickveh Israel of Philadelphia. It is devoted to the dissemination of Hebrew culture and religion and is, in effect, a Jewish teachers' college.

**GRAU, grow, Maurice**, American operatic manager: b. Brünn, Austria, 1849; d. Paris, France, 14 March 1907. He came to the United States with his parents in 1854; was graduated from the New York College in 1867, and from Columbia Law School. From 1872 until 1903 he was the most prominent operatic manager in America, securing a long line of singers, musicians and actors, including names so diverse as

Aimée, Rubinstein, Salvini, Sarah Bernhardt, Patti, Irving, Coquelin, Jane Hading, Mounet-Sully, Mme. Rejane. As director of the Maurice Grau Opera Company, he brought some of the most famous singers of the day to America. He was manager of the Metropolitan Opera House, New York, from 1891 to 1903.

**GRAU, Miguel**, Spanish-American admiral: b. Piura, Peru, 1834; d. 1879. After studying in the naval school at Callao he entered the Peruvian navy as a midshipman in 1852. In 1871 he was put in command of the turret ship *Huascar*, and in the Chilean war of 1879 was killed by the explosion of a shell while engaged with two ironclads of the enemy.

**GRAUBÜNDEN**. See GRISONS.

**GRAVATT, William Loyall**, American Protestant Episcopal bishop: b. Port Royal, Va., 15 Dec. 1858. He was educated at Virginia State College and Virginia Theological Seminary. Deacon's orders were conferred upon him in 1884 and he was advanced to the priesthood in 1885. He was assistant rector of Saint Paul's, Richmond, Va., 1885-87; and rector of Saint Peter's, Norfolk, Va., 1887-93, and Zion Church, Charlottesville, W. Va., 1893-99. In 1899 he was consecrated bishop of western Virginia.

**GRAVE CREEK MOUND**. Set **MOUND BUILDERS AND MOUNDS**.

**GRAVEL**. See **CALCULUS**.

**GRAVELOTTE**, gräv'löt, Battle of, one of the most severely contested and most important conflicts of the Franco-German War (q.v.). It is named after a village of Lorraine, seven miles west of Metz, but is also called by the French the battle of SAINT PRIVAT, and of GRAVELOTTE and REZONVILLE. After the disastrous defeats at Wörth and at Forbach on 6 Aug. 1870 the French in two armies, one under MacMahon and one under Bazaine, retreated along the line of the Moselle, their object being to join forces at Châlons. To prevent this the first German army under Prince Frederick Charles intercepted Bazaine by a circuitous march, forced upon him the battle of Courcelles and Mars-la-Tour and compelled him to keep within touch of Metz. On 18 August the armies of Prince Frederick Charles and Steinmetz, numbering about 211,000 troops under the command of King William, attacked the position. Bazaine had taken a very strong position with about 111,000 men around Gravelotte on a ridge of hills to the west of Metz, and fronting westward. His line extended from Rancourt and Saint Privat on the north through Amanvillers and Chatel to Rozerieulles. The Germans were not well informed as to the exact position of the French, believing the latter's right to be at Amanvillers, whereas it extended fully three miles further north to Rancourt. A flanking movement against the French right was determined on by the Germans, joined with a frontal attack on the left and centre. The flanking movement was delayed because the French right was three miles further north than had been expected and the frontal attacks, which were launched at noon about Verneville, were checked. A cavalry charge by the Germans was also repulsed. The Germans carried the heights of Moscon, Saint-Hubert and Point-du-Jour during the afternoon, but the battle was undecided until about 7 o'clock, when the

flanking movement on the French right was finally carried out. The Prussian Guards and Saxon troops took Saint Privat and drove the French right from its position, while the French centre and left were checked from breaking through at Gravelotte. The Germans lost over 28,000 men and the French over 12,000; the latter were forced to retreat into Metz, which was immediately invested by Prince Frederick Charles, and capitulated two months later on 27 October. Consult Bleibtreu, C., 'Die Schlachten um Metz' (Metz 1910), and Erb, F. E. H., 'L'Artillerie dans les batailles de Metz, 14-18 août' (Paris 1906).

**GRAVES, Anson Rogers**, American Protestant bishop: b. Wells, Rutland, Vt., 13 April 1842. He was graduated at Hobart College 1866. He was ordained priest in 1871, and was assistant in Grace Church, Brooklyn, 1870-71; rector of Plattsburgh, Neb., 1873; and other pastorates in Minneapolis, Northfield, Minn., and Bennington, Vt. In 1890 he was consecrated bishop of the Platte, now the district of western Nebraska. He resigned in October 1910. He has published 'The Farmer Boy Who Became a Bishop'; 'Sermons for Lay-Readers.'

**GRAVES, Frederick Rogers**, American Protestant Episcopal bishop: b. Auburn, N. Y., 1858. He was graduated at Hobart College (1878), and the General Theological Seminary (1881). His ministry has been devoted to work in China, and he is the author of several works in the Chinese language. His consecration as bishop of Shanghai took place in 1893.

**GRAVES, John Temple**, American journalist and orator: b. Wellington Church, Abbeville District, S. C., 9 Nov. 1856. He was graduated at the University of Georgia in 1875. He is well known as an orator and leader of patriotic sentiment in the South. He was on the staff of the *Atlanta Journal*; was editor of *Atlanta Daily Georgian* 1905-07; and from 1907 to 1915 editor of the *New York American*. Since 1915 he has been editorial representative of the Hearst newspapers. In 1908 he was candidate of the Independence party for Vice-President. He became president of the New York Press Club in 1913; is well known as a progressive and patriotic leader, an advocate of universal peace by arbitration, of national preparedness as the best guarantee of peace, and of separation of black and white races. He has written 'History of Florida of To-Day'; 'History of Colleton, S. C.'; 'Speeches and Selections for Schools' and 'The Negro.'

**GRAVE'S DISEASE.** See THYROID, DISEASES OF.

**GRAVITATION.** The law of gravitation is the law discovered by Newton, according to which every portion of matter attracts every other portion with a force directly proportional to the product of the two masses, and inversely proportional to the square of the distance between them. The motion of the planets round the sun in ellipses, each marking out the area of its orbit at a constant rate, and each having a year proportional to the square root of the cube of its mean distance from the sun, implies that there is such a force on each planet exactly proportioned to its mass, directed toward, and inversely as the square of its distance from the sun. The lines of force radiate out from the

sun on all sides equally, and always grasp any matter with a force proportional to its mass, whatever planet that matter belongs to. Since the force is always proportional to the mass acted on, and produces the same change of velocity whatever that mass may be, the change of velocity tells us nothing about the mass in which it takes place, but only about the mass which is pulling. If, however, we compare the accelerations due to different pulling bodies, as for instance that of the sun pulling the earth with that of the earth pulling the moon, or if we compare changes in motion due to the different planets pulling each other, then we can compare their masses and weigh them one against another and each against the sun.

All this was clearly seen by Newton, and was set forth in his 'System of the World' (3d ed., p. 41). Kepler (q.v.) had indeed given the laws, deduced from observation, according to which the planets describe their orbits. From these Newton deduced the laws of the force in the case of the planets; and subsequently he generalized the statement of them, by showing the identity of the nature of the force that retains the moon in her orbit, and that which attracts matter near to the surface of the earth. Kepler's laws state, first, that every planet revolves around the sun in an ellipse, of which the sun occupies one focus; second, that the velocity of any planet at different parts of its orbit is such that the radius vector from the sun to the planet sweeps over equal areas in equal times; and third, that the distances of the various planets are so related to the periods of their revolution that the squares of the periodic times are proportional to the cubes of the mean distances from the sun. From these laws Newton made the following deductions: He inferred from the second law that the planet is acted on by a central force that is always directed toward the sun. From Kepler's first law he deduced the law of variation of the force for any one planet, and found that the force varies inversely as the square of the distance of the planet from the sun. Lastly, he concluded from Kepler's third law a relation between the forces on the various planets; namely, that the forces on equal masses of the different planets are inversely proportional to the squares of the distances of those planets from the sun. This law indicates the identity of the nature of the force that acts on the different planets. Newton next proceeded to consider the motions of the moon; and to ask the question, 'Is not the force that causes the moon to fall toward the earth the same as that which influences falling bodies near to the earth's surface?' This question he attempted to put to the test of calculation. At first he was unsuccessful. The then received estimate of the dimensions of the earth were so far from correct that the comparison between the force of attraction in a stone and that in the moon at her distance from the earth did not exactly agree with his theory, and he was obliged to give it up for nearly 20 years. It was not till 1684, when he heard a paper of Picard read at the Royal Society of London, on new geodetical measurements of the earth, that he obtained accurate data to work with; and, returning home, he set to work to examine the question afresh.

Newton saw that a mountain mass might be used, and weighed against the earth by finding

how much it deflected the plumb-line at its base. The density of the mountain could be found from specimens of the rocks composing it, and the distance of its parts from the plumb-line by a survey. The deflection of the vertical would then give the mass of the earth. Not long after Newton's death the mountain experiment was actually tried. The honor of making the first experiments on gravitation belongs to Pierre Bouguer (q.v.), whose splendid work does not appear to have received the credit due it.

Having established the law of gravitation throughout the solar system, it was natural to infer the universality of its action. We know on the one hand, by observing the motion of the planets and satellites, the asteroids, and the comets, that the law holds with great exactness for all these bodies; on the other hand, experiments of Cavendish with balls of lead, and of others, verify its exactness down to very short measurable distances: and though we are unable with our present appliances to determine the orbits of double stars and of other stellar systems, still we seem to be fully justified in assuming that in these cases also the law stated above holds, at least, very approximately.

The track was first laid down by Newton, based on astronomical observations, and only made firmer and broader by every later observation. Important work in Europe has recently been done in gravitational experiments by the late Prof. U. Jolly, and by Profs. Braun, Boys and Poynting, who, with others, have advanced beyond the results of Henry Cavendish (q.v.), whose device, known as the Cavendish experiment, for determining the density of the earth, has so long interested scientists. The latest research has verified Newton's celebrated guess that "the quantity of the whole matter of the earth may be five or six times greater than if it consisted all of water."

No inquiry on gravitation has showed that it is related to anything but the masses of the attracting and the attracted bodies. It appears to have no relation to physical or chemical condition of the acting masses or to the intervening medium. This independence of gravitation of any quality but mass, bars the way to any explanation of its nature or source.

There is a point respecting the law which is almost universally passed over without notice, although it is one of the most important questions with respect to the construction of any theory to account for gravitation; namely, the exact proportionality of the gravitating forces of any two bodies to their masses. The most delicate experiments show no deviation from the exactness of this law; nor has the most accurate observation of planetary bodies sufficed to detect any such deviation. This is the fact proved by the well-known guinea-and-feather experiment, in which it is shown that though a mass of gold and a feather do not fall equally fast under ordinary circumstances, because of the unequal resistance of the air in the two cases, yet that, the air being removed by means of the air-pump, they fall with equal velocity. The experiment proves that the force of gravity in the two cases is exactly proportional to the mass of the guinea and of the feather. Newton showed the same thing himself with far greater minuteness by vibrating balls of various materials similarly suspended. In this, which is

known as Newton's pendulum experiment, it is shown that pendulums of equal length vibrate in equal times whatever be the material and the masses of which the bobs of the pendulum are made. By this experiment, when performed with all the nicety at command, it is probable that any deviation amounting to a ten-thousandth or a hundred-thousandth part of the whole amount considered could be detected. Planetary motions prove the law to even a greater degree of accuracy. It is curious that this portion of the law, though it is only proved by experiment and observation, is hardly ever, if ever, referred to by popular writers. It is either assumed without pretense of proof, or is passed over without remark.

Notwithstanding the vast interest and importance of the study which this subject presents, and all the labors of eminent scientists in endeavors to solve its complex problems, it still remains to be said that the world is yet without any theory which can really be considered as explaining gravitation. Consult Mackenzie, 'The Laws of Gravitation' (1900).

**GRAVITY**, in physics, the linear acceleration downward of falling bodies, due to the gravitation of the earth. If the earth were a perfect sphere, gravity would be uniform at all points of its surface; but because the earth is flattened at the poles, and therefore the polar radius is less than the equatorial radius, gravity is greater at the poles. Newton (q.v.) and Bessel have shown that in a vacuum a sovereign and a feather will fall with equal speed, though in atmospheric air the rate will be different owing to the air's resistance. The attraction of the whole earth, considered as a sphere, on a body at its surface, is the same as if the whole matter of the earth were collected at its centre, and the nearer to its centre the greater the force exerted. Gravity is symbolized in physics by the letter *g*. The value of *g* as given by Helmholtz's formula is, in feet per second,  $32.0875 (1 + 0.0005302 \sin^2 \phi - 0.000007 \sin^2 \phi)$ , at the sea-level,  $\phi$  representing the latitude north or south of the equator. At the equator it is about 32.0875 feet per second, and at the poles about 32.2577 feet per second. See FORCE OF GRAVITY.

**GRAVITY, Specific.** See SPECIFIC GRAVITY.

**GRAY, Asa**, American botanist: b. Paris, Oneida County, N. Y., 18 Nov. 1810; d. Cambridge, Mass., 30 Jan. 1888. He was graduated at the Fairfield Medical College in 1831; but had already acquired a taste for natural science which led him to abandon the practise of medicine for the study of botany. He became curator of the New York Lyceum of Natural History. The flora of the United States was by no means well known and classified at that period, and many botanical problems were to be solved by the attainment of new data in his chosen science. He had attracted notice so early as 1834 and was appointed botanist to the Wilkes Exploring Expedition, which was so dilatory in starting that he resigned the position in 1837, and in 1842 was elected Fisher professor of natural history at Harvard University. Between the resignation of his post as botanist to the Wilkes Expedition and his acceptance of the chair at Harvard, he took the opportunity of traveling over Europe, where he

made many social and scientific friends and in England met Dean Church of Saint Paul's, London, then Fellow of Oriol College, Oxford, with whom he kept up a correspondence of the most intimate friendship until his death. Both were many-sided men of keen intellect and reverent minds. From 1842 to 1873, when he retired from his professorate at Cambridge, the life of Gray is to be read in his published works. He gradually developed the reputation of a botanist of the first rank, one of the greatest of his century and certainly the greatest his country had ever produced. His lot was cast at a point in the history of science when the artificial system of botany was to pass away, and the new and natural method was to undergo development. There were vast masses of new material constantly pouring in from the newly explored Middle Western Territories, together with the rich spoils that government expeditions were bringing by sea from the Pacific Coast. Professor Gray, with the assistance of Dr. John Torrey (see TORREY, JOHN), set about to arrange these multitudinous specimens in accordance with the newest methods; to identify, name and classify them. His work was to be called the 'Flora of North America,' and was to be a comprehensive history of the botany of the country upon a classification basis of natural affinity. This work was not completed beyond the order of *Compositae*, as the constant accessions of new specimens rendered the portions already published out of date, and proved that the attempt at so colossal an undertaking would be premature before all the material was in, and every specimen had been deliberately examined and classified. Yet Gray's pen could not be idle, and he published volume after volume in which he showed he was as clear and concise as an exponent of botany in its elementary principles as he was skilful and bold in wide generalizations and profound analysis. His scientific position was that of a theistic evolutionist. He dissented from Darwin's opinion that variation was the result of fortuitous contingencies. He was a teleologist and believed that species were differentiated according to a preordained plan in the mind of a creator, and he was of the spirit that could subscribe to evolution and yet repeat the Catholic creed. His principal writings are as follows: 'Elements of Botany' (1836); 'Structural and Systematical Botany' (1879); 'Manual of Botany for the Northern United States' (1848); 'Genera Boreali-Americana Illustrata' (1849); 'Botany of the United States Exploring Expedition under Captain Wilkes' (1854); 'Plantae Wrightianae Texano-Neomexicanae' (1853); 'Darwiniana, Essays and Reviews Pertaining to Darwinism' (1876); 'Synoptical Flora of North America' (1884); 'Natural Science and Religion' (1880); published posthumously, but edited by Sargent, 'Scientific Papers of Asa Gray' (1889); and 'Letters of Asa Gray' (1894).

**GRAY, Barry.** See COFFIN, ROBERT BARRY.

**GRAY, David,** American journalist: b. Buffalo, N. Y., 8 Aug. 1870. He was graduated from Harvard in 1892, where he wrote the Hasty Pudding Club play 'The Sphinx,' entered journalism in 1893 as a reporter and editorial writer for the *Rochester Union and Advertiser*, became managing editor of the *Buffalo Courier* in 1897, and after a course in law

was admitted to the bar in 1899. He has published 'Gallops,' a collection of fox-hunting sketches reprinted from the *Century* in two volumes, 'Mr. Carteret and His Fellow Americans Abroad,' 'Ensign Russell' and various short stories in current periodicals. In 1906 his play 'Gallops' based on his stories was produced at the Garrick Theatre, New York, and ran through the season.

**GRAY, Elisha,** American inventor: b. Barnesville, Ohio, 2 Aug. 1835; d. Newtonville, Mass., 21 Jan. 1901. During his attendance at Oberlin College his skill in handicraft enabled him to support himself by carpentry. He left college to apply himself to the improvement of electrical apparatus; and in 1867 received his first patent for self-adjusting telegraph relay. He subsequently invented the telegraphic switch and annunciator for hotels and the telegraphic repeater, the private telegraph line printer. The litigation between him and Alexander Graham Bell, both of whom claimed to be inventors of the telephone, resulted in a verdict in favor of the latter, whose rights were sustained by the Supreme Court. The tauto-graph, by which written messages were to be sent over the telephone or telegraph was patented by him in 1893. For many years he was engaged in the manufacture of electrical apparatus in Chicago and Cleveland and founded the Gray Electric Company in Highland Park, Ill. The Congress of Electricians at the World's Columbian Exposition was organized by him in 1893, and he was elected to preside at its sittings. Among his writings the most notable are 'Experimental Researches in Electro-Harmonic Telegraphy and Telephony' (1878); and 'Elementary Talks on Science.'

**GRAY, Henry Peters,** American painter: b. New York, 23 June 1819; d. there, 12 Nov. 1877. He was a pupil of Daniel Huntington in 1838, and after several years abroad he established himself in New York, and was president of the National Academy 1869-71. Among the most important of his works are 'Wages of War,' now in the Metropolitan Museum; 'The Judgment of Paris'; 'Cupid Begging his Arrows'; 'Apple of Discord'; 'Blessed are the Pure in Heart,' an illustration of Irving's 'Pride of the Village'; 'Hagar and the Angel.'

**GRAY, Horace,** American jurist: b. Boston, 24 March 1828; d. Nahant, Mass., 15 Sept. 1902. He was graduated from Harvard in 1845; from the Harvard Law School in 1849; studied law also in the office of Judge Lowell; was admitted to the bar in 1851, and in 1854-61 was reporter of the Massachusetts Supreme Court. At the same time he became a leader of the Massachusetts bar, in 1864 was appointed an associate justice of the State Supreme Court and in 1873-81 was chief justice. In 1881 he was appointed to the Supreme Court of the United States, and this post he held until his resignation in 1902.

**GRAY, John Purdue,** American alienist: b. Half Moon, Pa., 1825; d. Utica, N. Y., 29 Nov. 1886. He was graduated from Dickinson College in 1846 and took a medical degree at the University of Pennsylvania in 1848. He was successively assistant physician and medical superintendent of the New York State Asylum at Utica. He introduced many improvements into the treatment of the insane, and was for

many years editor of the *American Journal of Insanity*.

**GRAY, Maxwell.** See TUTTLET.

**GRAY, Robert,** American discoverer: b. Tiverton, R. I., May 1755; d. Charleston, S. C., 1806. In 1787 he was appointed to the command of the sloop *Washington*, equipped by Boston merchants for trade with the Indians of the Pacific Coast. He returned in the *Columbia* in 1790, and, proceeding by way of Canton, was the first to carry the United States flag around the earth. During a second voyage he discovered the Columbia River, which he named from his ship. He was subsequently in command of trading vessels.

**GRAY, Thomas,** English poet and scholar: b. Cornhill, London, 26 Dec. 1716; d. Cambridge, 30 July 1771. He was the fifth child and only survivor of 12 infants born to Philip Gray, a money-scrivener, and Dorothy Antrobus, a one-time milliner. The father was brutal and maltreated his wife, who had to support herself and her son. When Gray was 11 he was sent to Eton, where his uncle, William Antrobus, was one of the masters. Here he formed a close intimacy with a few boys of quiet tastes—notably with Horace Walpole (q.v.) and Richard West, upon whose death he wrote one of the few sonnets to be found in the literature of the early 18th century. Seven years later (1734), Gray became a pensioner at Peterhouse, Cambridge, Walpole coming up the next year but to another college. Gray found the courses at Cambridge unsatisfactory, his tastes being at that time literary rather than scientific and philosophical, and he was not sociable or inclined to sports. He left in 1738 without taking a degree and lived a few months in London before he accepted Horace Walpole's invitation to become his companion on a "grand tour" of the Continent. They left England late in March 1739, spent some months in France and Switzerland, crossed into Italy in November, visited Florence, Rome and other cities, returned to Florence in July 1740 and passed some time with Horace Mann, the English Minister, afterward Walpole's correspondent, and in April 1741 started for Venice but parted at Reggio in consequence of a quarrel as famous as it is mysterious in its details. It seems quite certain that Walpole's confession to William Mason (q.v.), the poet and biographer of Gray, that he treated his sensitive companion superciliously and so caused the rupture, is in essentials the true explanation; it seems also certain that their friendship would never have been renewed if anything very disgraceful had occurred; but it is equally likely that something happened about which it was desirable to keep silence. Gray went on to Venice by himself, returned through Verona, Milan and other places, paid a second visit to the Grande Chartreuse, where he wrote in the album the famous 'Alcaic Ode' (August 1741—the original was destroyed by a mob in the French Revolution), and reached home 1 Sept. 1741. Two months later, his father, with whom Gray seems to have been on better terms than the parent's brutality warranted, died of gout after having squandered a fairly considerable fortune.

Gray and his mother remained in London for some time, the former suffering from a

naturally morbid temperament and the loss of his friend West, making but slight efforts to enter the profession he was dallying with, the law. In October 1742 Mrs. Gray went to live with her two sisters in the house of one of them at Stoke Poges in Buckinghamshire, and Gray betook himself to Cambridge in order to study the civil law. He was made LL.B. in 1743, but really spent most of his time reading Greek and annotating what he read with the care he had displayed in noting down what interested him during his tour.

Cambridge, though he disliked the place and had few congenial friends there, became practically Gray's residence for the rest of his life, since he could live comfortably on his small income and could have access to books. Among his few friends, who did not, however, remain in Cambridge permanently, were his correspondents, Dr. Thomas Wharton and the Rev. William Mason, the latter a rather servile literary follower. In 1744 the friendship with Walpole was renewed and Gray became a visitor to Strawberry Hill. He also went every summer to Stoke Poges to see his mother, who died there in 1753. But he could never be drawn out by others, and he never "spoke out." A small literary controversy has arisen over the reasons of his sterility as a writer, some attributing it mainly to his retiring character and his constitutional melancholy and delicate health (cf. D. C. Tovey, 'Gray and his Friends' (1890); and W. L. Phelps, 'Selections from Gray's Poems' (1894); others, of whom Matthew Arnold is the main exponent, emphasizing the blighting influence exercised upon Gray's essentially romantic genius by the dominance of the pseudo-classical school of Pope (cf. Arnold's essay on Gray in 'Ward's Poets,' Vol. III). There is probably something in both views. Gray was shrinking and fastidious in temperament, and he was also depressed by the standards of his age in respect to poetry; for, if he was not, he presents, as Arnold claimed, the extraordinary phenomenon of a poet whose achievements show the powers of a master producing far less than equally fastidious and delicate masters who have had the good fortune to write in epochs more propitious to their genius.

Meanwhile, Gray, indolent and irresolute though he was, had slowly laid the basis of his fame as a poet. In 1742 he wrote the sonnet to West, and the pensive and beautiful 'Ode on a Distant Prospect of Eton College' (published anonymously, 1747). In 1743 he began, but soon discontinued, his ably sententious poem on "The Alliance of Education and Government"—forested by the appearance of Montesquieu's 'Esprit des Lois,' but an interesting proof that Gray tried to get himself somewhat in touch with his contemporaries. Five years later the 'Ode to Spring' and the stanzas on the drowning of Walpole's cat appeared, and in 1749 he took up again the most famous of all his poems, the 'Elegy Written in a Country Churchyard,' which had been begun in 1742. It was finished at Stoke Poges in June 1750, and attracted so much attention in manuscript that a pirate announced his intention of printing it. This caused Gray to authorize Dodsley, to whom he rather loftily yielded all the profits, to print an edition in February 1751. It attained at once the popularity it has never lost,

and was much imitated and parodied throughout the Western world. In August 1750 that admirable piece of *vers de société*, 'A Long Story,' was written, and in 1753 his six best poems, including a 'Hymn to Adversity,' were published with designs by Richard Bentley. The next four years saw the writing and printing (at Strawberry Hill) of the two Pindaric odes, 'The Progress of Poesy' and 'The Bard'—not the earliest but among the best of their kind in English and exhibiting, as Gray and Arnold thought, the highest reaches of Gray's poetic genius. Curiously enough many people found them obscure, but they had warm admirers from the beginning, one of whom secured for Gray, late in 1757, the offer of the Laureateship, which he declined.

The rest of Gray's life is summed up in his friendship, his studies and his travels. In 1756 he changed his quarters from Peterhouse to Pembroke because some undergraduates, hearing that his fear of fire had caused him to buy a rope ladder, induced him by their cries to use it and in consequence to land himself in a tub of water. The rude prank was not followed by the proper punishment, and Gray was very indignant. He found consolation, however, in making young friends like Norton Nicholls, in studying (1759-61) in the newly opened British Museum and in taking tours through regions marked by romantic scenery, to the beauties of which he was one of the first Englishmen to open his eyes appreciatively in a modern fashion. In 1764 and 1765 he visited Scotland (making friends with a fellow Romanticist, James Beattie—q.v.), and in 1769 he paid the famous visit to the English Lakes described in his journal. In connection with his love of romantic scenery and with the morbid temperament, which gave him his post of eminence among the "Churchyard Poets," should be mentioned his enthusiasm for the buildings and the writings of the "Gothic" past—another characteristic feature of the new school of revolt from classicism. Gray was delighted with Macpherson's 'Ossian' and wrote in imitation of the Norse and Welsh his 'Fatal Sisters'; 'Descent of Odin'; and 'Triumphs of Owen' (published 1768). In 1762 he had applied for the regius professorship of history and modern languages at Cambridge, but had failed to secure it; six years later, his successful competitor having died from an accident when drunk, the post with its good salary and nominal duties was given to Gray. He did not wish to seem ungrateful and so, in return for the Duke of Grafton's kindness, he wrote an ode for the installation of that worthy as chancellor of Cambridge (1 July 1769). The next year he visited London with his young friend the Swiss naturalist, Bonstetten, but in 1771 he was forced to deny himself the pleasure of going to see this friend in his foreign home. He was taken violently ill with vomit of the stomach and died on 30 July. He was buried a week later in a vault with his mother at Stoke Poges.

Despite the paucity of his poetry, Gray's position as a classic has long been secure. He is the chief English elegist and eminent as a master of the elaborate, not the simple and singing lyric. His letters are among the most charming of his period, and his notes on classical and mediæval authors, on genealogy, heraldry, painting, architecture, ornithology and

botany show the extraordinary range of his accomplishments. His knowledge of Norse has been greatly exaggerated (cf. G. L. Kittredge in Phelps), but in certain senses Leslie Stephen did not exaggerate when he wrote in the 'Dictionary of National Biography,' apropos of a man who could admire almost equally Shakespeare and Racine, that Gray, "the most learned of all our poets . . . was naturally an eclectic." See ELEGY in a COUNTRY CHURCHYARD.

**Bibliography.**—For Gray's life see the biography by Mason (1774)—not that by Johnson, which is one of the worst of the 'Lives,'—and also the letters given in the editions of Mitford and Gosse. The latter (4 vols., 1884) is the fullest. There are numerous editions of the poems, e.g., the new 'Aldine' by John Bradshaw (1891); and there is a fair amount of criticism to be found in the books previously named and in Gosse's biography in the 'English Men of Letters' (1882). Add the works of Phelps and Beers on English Romanticism in the 18th century and the histories of English literature, as well as a good essay by Lowell. Tovey's 'Gray and His Friends' contains a considerable amount of previously unpublished material.

WILLIAM P. TRENT,  
*Professor of English Literature, Columbia University.*

**GRAY, William Crane**, American Protestant Episcopal bishop: b. Lambertville, N. J., 6 Sept. 1835. He was graduated at Kenyon College (1859); ordained deacon in 1859 and priest in 1860. He was consecrated bishop of southern Florida in 1892.

**GRAY DUCK**, the gadwall (q.v.).

**GRAY WHALE** (of California). See RORQUAL.

**GRAYBACK**, the name, in popular speech, of several animals strikingly gray in color, as the gray whale (see RORQUAL); the knot (q.v.) and certain other shorebirds; or a body-louse. See LOUSE.

**GRAYBEARD MOSS**. See USNEA.

**GRAYHEN**. Feminine of BLACKCOCK (q.v.).

**GRAYLAG GOOSE**. See GEES.

**GRAYLING**, a fish of the family *Thymallidae*, much resembling a slender salmon, 15 to 18 inches long, and formerly included in the salmon family. Some five species of the single genus *Thymallus* are known, all inhabitants of northern regions, in rapid streams where the water is clear and cool and the bottom sandy or pebbly. Its habits are similar to those of trout, except that it spawns in the spring. Its flesh is excellent, with an odor and flavor, when fresh, of wild thyme. It is caught by fly-fishing as for trout, and is a favorite with anglers. The European grayling extends from Russia, Siberia, Scandinavia and England to Switzerland and Hungary. Two species are known in North America, each with so limited and scattered a distribution that they are regarded as modified relics of a preglacial circumpolar species. The Arctic grayling, or "poisson bleu" (*T. signifer*) of the fur-hunters, inhabits only the Mackenzie Basin and rivers in Alaska. The more southerly and familiar grayling (*T. tricolor*) is restricted to certain streams in northern Michigan, where it is al-

most extinct, and seems incapable of recovery by fish-cultural methods; and to Montana. These fish are distinguished from trout or salmon by the large size of the dorsal fin and by their grayish hue, with half-a-dozen deep blue spots on the forepart of the abdomen. Consult Pritt's 'Book of the Grayling' (London 1888); and Jordan and Evermann's 'American Food and Game Fishes' (New York 1902).

**GRAY'S INN**, one of the four Inns of Court (q.v.) in London, situated on the north side of Holborn and to the west of Gray's Inn lane. It contains a hall of the period of 1560. It derives its name from the noble family of Gray of Wilton.

**GRAY'S PEAK**, a peak in the Colorado range, in Colorado, one of the highest in the Rocky Mountains. Its height is 14,341 feet. It was named in honor of Asa Gray, the botanist.

**GRAYSON, William**, American revolutionist and senator; d. 1790. The date of his birth in Prince William County, Va., is unrecorded. He graduated at Oxford University, England; studied law at the Inner Temple, London, and returned to America to practice as a lawyer at Dumfries, Md. Strongly opposed to the colonial administrative methods of George the Third's government, he became an active revolutionist and in 1776 was aide-de-camp to General Washington. As colonel of a Virginia regiment he gained distinction at the battle of Monmouth; was appointed commissioner by Washington to treat with General Howe in the exchange of prisoners; and was a member of the board of war 1780-81. At the close of the Revolutionary War, he again became a lawyer in Virginia. From 1784-87 he was a member of the Continental Congress; in 1788 was a delegate to the convention to consider the new Federal Convention; and the year before he died was selected as one of the Virginian senators in the first national Congress.

**GRAYWACKE**, grā'wāk, a rock name very loosely used. The term has been commonly applied to a shaly sandstone, usually of dark color. More specifically it indicates a rock consisting of fine fragments of incompletely weathered basic igneous rocks bearing the same relation to these that arkose bears to granite. See **ARKOSE**.

**GRAZ**, or **GRATZ**, grāts, Austria, the capital of the crownland of Styria, on the river Mur, 140 miles by rail southwest of Vienna. The town is noted for its beauty and its picturesque setting in attractive scenic surroundings amid the Styrian Alps. It is traversed by the river which spanned by seven bridges connects the inner town on the left bank with the town on the right bank. The inner town is built around the former fortified Schlossberg, dismantled by the French in 1809. The Stadtpark is at the foot of the Schlossberg, the summit of which commanding a beautiful outlook is reached by a cable tramway. The mediæval ramparts and bastions have been replaced by attractive tree-lined promenades. Graz dates from the 9th century. Among the chief buildings are the 11th century castle, now used as government offices; the 16th century Renaissance landhaus where the local diet as-

sembles; the arsenal dating from 1644 and containing a valuable historical armory of 15th to 17th century weapons; the town hall built in 1807, and rebuilt in German Renaissance architecture in 1892; the university buildings dating from 1573; the law courts; the Joanneum Museum founded in 1811 with its important collections and great library, and the technical college founded in 1814. The Gothic cathedral of Saint Ogidius, dating from 1450-62, occupies the site of a former church founded 1157. The Gothic parish church finished in 1520 was restored in 1875; the Augustinian University church; and the small 13th century Leech Kirche are also interesting buildings; the early Gothic Herz Jesu-Kirche, completed in 1891, has a tower 360 feet high. An important railway centre with extensive railway shops, and direct communication with the Köffach coal-fields. Grätz is a busy industrial town manufacturing and carrying on a lucrative trade in iron and steel wares, paper, artistic printing and lithography, physical and optical instruments, chemicals and a domestic commodities. Pop. 152,000.

**GREASE-BUG**, or **OVERFLOW-BUG**, a ground-beetle (*Platynus maculicollis*), common in California, and occasionally a pest in houses because of its disagreeable odor when crushed, and because it nibbles bread and meats.

**GREASEWOOD**, a very thorny, almost leafless shrub (*Sarcobatus vermiculatus*) of the goosefoot family (q.v.), which abounds among the sage brush on the arid plains of the western United States, especially where the soil is saline. The wood is yellow, very hard and tough.

**GREAT AUK**. An extinct auk (*Plautus impennis*), much like the existing razor-bill, but larger (nearly the size of a goose), with a larger bill and relatively smaller wings; formerly called garefowl. It was black above and white below, with a conspicuous white patch in front of the eye. It was an expert swimmer and diver, but unable to fly on account of the very small size of its wings. The habits of the garefowl were those of auks generally, but its range was limited on the American coast to the vicinity of Newfoundland. It seems never to have lived north of the Arctic Circle; but its bones in shell-heaps testify to its former occurrence, at least in migrations, southward as far as Florida. These birds bred on small islands off the coast of Iceland, and on the Orkneys and Hebrides. Early in the 19th century they disappeared from these haunts, mainly through the persecution of fishermen and sailors who had for years killed them for food, bait and feathers; but they lingered somewhat longer in the Gulf of Saint Lawrence. Cartier's vessels visited Funk Island in 1534, and the crews easily filled two boats with the birds which they knocked down with sticks; and their abundance was mentioned as one of the inducements for settlers to come to Newfoundland. For many years the colony was ruthlessly harried, yet a few pairs survived until about 1840. A small breeding-place remained in Iceland until 1844, when the last few pairs were killed as museum specimens. The skins of this auk have been sold for \$650, and an egg for \$2,500. About 78 specimens of the bird are preserved in museums throughout Europe and America. Consult Newton's 'Dictionary of Birds,' article

'Garefowl,' and articles by F. A. Lucas in 'Reports United States National Museum' for 1887-88 and for 1888-89.

**GREAT AWAKENING**, the popular name of a great and tenacious "revival" in New England, 1740-45, under the influence of Jonathan Edwards and George Whitefield. Edwards had created a similar excitement in Northampton five years before, the embers of which were still glowing, but on Whitefield's visiting him in the fall of 1740, and preaching his thrilling sermons in addition to Edwards', the wave spread all through New England, involving over 150 towns, and rising almost to frenzy. It was marked by the extreme accompaniments of bodily seizures, convulsions, hysteria, etc., and aimed especially to bring young children under its control. Edwards was rightly considered its author and was fiercely denounced for its irrationality and evil effects on public worship, as well as the temporary ruin of calm and fruitful work; he defended it for some time, but its results at last came to be deplored even by its champions, and by 1742 it was threatening not only the peace but the life of the churches. So bad were its effects that to the reaction has been attributed the religious deadness of the country for the next 60 or 70 years. The separation of the "converted" into an arrogant clique who often seceded in separate churches, the upspringing of a horde of ignorant lay preachers making physical effects the touchstone of religion, the indecent rivalry in "manifestations," the denunciation of all the trained ministry as lacking divine grace, were only a part of its demoralizing outcomes. The faculties of Yale and Harvard colleges pronounced against it, as did the leading divines; the Massachusetts General Convention of 1743 added its testimony, and in Connecticut an effort was made to enforce the Saybrook Platform against the independence of congregations.

**GREAT BARRINGTON**, Mass., town in Berkshire County, on the New York, New Haven and Hartford Railroad and on the Housatonic River, 40 miles west of Holyoke. In the town are three villages: Great Barrington, Housatonic and Van Deusen. It was settled in 1725, but formed a part of Sheffield until 1761. William Cullen Bryant was town clerk for several years and the thoughts in many of his poems were suggested by the beautiful Berkshire scenery. The town has two public libraries, the Hopkins Memorial Manse, the Sedgwick Institute and a number of good elementary schools. The manufactures are cotton goods, electrical apparatus and paper. Owing to the picturesque scenery of the vicinity it is a popular summer resort. The government is carried on by annual town meetings. Pop. 5,926. See Taylor, 'History of Great Barrington' (Great Barrington 1882).

**GREAT BASIN**, a vast region of interior drainage, a triangular plateau of North America, occupying the western part of Utah and nearly the whole of Nevada, parts of Oregon and California and extending at its northeast angle into Idaho. It is bounded on the west by the Sierra Nevada and on the east by the Wasatch Mountains. The base of the triangle at the north is 500 miles from east to

west and the extent from north to south is 800 miles. The area is about 210,000 square miles, a little larger than France. It is traversed by numerous mountain ranges, irregular in arrangement; the valleys are mostly sinks, the chief drainage centre being Great Salt Lake (q.v.). The areas of greatest depression are to be found near the borders and the greatest elevation near the central part. The highest range is the East Humboldt, one peak of which, Mount Bonpland, is 11,321 feet in height. Volcanic masses form or conceal the original rocks of many of these ranges. The slopes and the geological markings show that the lakes and rivers which once existed within this region have become smaller and some have disappeared. Among the more notable of the extinct lakes are Bonneville and Lahontan. The greater portion of this section was once in the basin of the Columbia River. The Great Basin contains many streams and lakes (the latter for the most part salt) whose waters never reach the ocean, but are either taken up by evaporation or their waters sink in the desert sands. The mean annual rainfall ranges in different localities from 4 to 15 inches. The plateau is nearly destitute of trees and in general only the upper parts of the valleys are clothed with desert shrubs, their lower portions often being covered with muddy water or with several inches of alkaline salts left by evaporation. The chief arid places are the Great Salt Lake Desert, the Mohave Desert and the Carson Desert. This basin is rich in mineral wealth; gold, silver, iron ore and copper exist here in large quantities. The Great Basin is among the large interior drainage sections of the world; but the interior drainage basin of Asia is 23 times as great and the Sahara 16 times as great.

**GREAT BEAR LAKE**. See BEAR LAKE, GREAT.

**GREAT BEND**, Kan., city, county-seat of Barton County, on the Arkansas River, the Missouri Pacific and the Atchison, Topeka and Santa Fé railroads, about 92 miles northwest of Wichita. The Central Normal College is located here and it contains a Carnegie library, a hospital and an Elks' Home. It is the trade center of a rich farming and stock-raising region, has flour mills, iron works, machine shops, grain elevators and a refrigerating plant. The commission form of government was adopted in 1913. Pop. 4,622.

**GREAT BRIDGE**, Va., Battle at, 9 Dec. 1775. Lord Dunmore, royal governor of Virginia, hearing that a patriot force from North Carolina was on the way to occupy Norfolk, the largest town in Virginia and its chief port, built a rough fort at Great Bridge, over the Elizabeth River, commanding the southern approach. The Virginia patriots raised a band of sharpshooters, including John Marshall, afterward chief justice of the United States Supreme Court, took possession of the opposite bank and in a 15-minute fight, which cost Dunmore 61 regulars and the militia none, forced him to abandon the fort. A few days later the Virginians occupied Norfolk, which the spiteful governor set on fire before taking refuge in a war-ship in the harbor. The town was reduced to ashes.

**GREAT BRITAIN.** The following series of articles dealing with the various aspects of British educational, religious, political and commercial life, presents the history, development and rise of the United Kingdom to its prominent position among the leading nations of the world. The peculiarities of British institutions make it impossible to understand them apart from their history, and the aim set before the contributors has been to furnish a well co-ordinated section, reviewing the leading characteristics of the British nation and its advance, as they are seen to be the natural outcome of history.

### 1. GEOGRAPHICAL ENVIRONMENT.

The Greeks could not have played their decisive rôle in history had they not dwelt in the centre of the lands, amid the islands and peninsulas between Europe and Asia. Nor is it likely that any race less happily endowed could have achieved what the Greeks achieved even in that favored environment. A like relation is true as between the British race and the British Isles.

The origins of the British race are recounted in the next article of this volume. It is the aim of the present article to analyse the geographical influences which have contributed to British history.

Popular philosophy, as embodied in Shakespearean phrases such as the "moat defensive" and the "silver streak," would dismiss the matter as almost too simple and obvious for set discussion. The insularity of Britain has no doubt counted for more than any other single geographical cause, but the British polity and character are in fact the product of a very sin-

gular combination of geographical no less than historical circumstances. For the purposes of this short summary the major geographical controls of British development may be grouped under the nine following heads:

1. Insularity.
2. Shallow surrounding seas.
3. Neighborhood to the Continent.
4. Relation to the chief linguistic frontier of Europe.
5. Climate determined by oceanic winds.
6. Internal natural divisions.
7. Adequacy of economic bases.
8. Geographical momentum.
9. The consequences of sea power.

**1. Insularity.**— Britain has not been successfully invaded since the defeat at Hastings eight and a half centuries ago. The Englishman is ever conscious of this fact—it is a frequent argument in 20th century political speeches. The victories over the Spanish Armada and at Trafalgar have served to increase the sense of security, and freedom at home and empire abroad are the twin results. At home there has been an ineradicable jealousy of a standing army, and there has therefore been freedom for the development of what Bagehot described as "government by talk." The navy on the other hand has at most times been viewed with favor, for it has screened the experiments and mistakes by which popular government has been slowly nurtured. These mistakes were often such as would have involved a continental nation in the consequences of a Jena or a Sedan.

Insularity has also permitted of a concentration of purpose upon the sea which was impossible for the other maritime states along the western seaboard of Europe. England succeeded where Portugal, Spain, France and Holland failed, because, in the absence of a land frontier, her economic resources could be focussed on adventure beyond the seas. In this regard it must be borne in mind that sea-power does not rest on the navy alone, but on the co-operation of a mobile army with a dominant navy. An army limited to this subsidiary use has been possible for Britain because of her insularity. By her navy and amphibious army Britain won North America and the sovereignty of the Indies, while France and Holland were involved in continental wars. It was by the exhaustion of her enemies rather than by her victories that Britain achieved her empire. This is surely the truth which lies behind Seeley's famous utterance that Britain had "conquered and peopled half the world in a fit of absence of mind." Behind her girdle of seas she fought with a limited liability and was immune at home though often defeated abroad.

John Bull's insularity of character is the natural result of his strong frontier. Elsewhere the types of humanity merge gradually where political frontiers are crossed. In some respects this contrast between the British and the continental peoples was in the past even more obvious than to-day. Not only, on the one hand, is the traffic over the seas more frequent now, and Britain's isolation in time of peace less marked, but on the other hand, the change at the conventional continental frontier has been emphasized owing to the centralized character of the modern great state. Ever since the days of the first Edward, the English-

man has felt himself a foreigner from the moment that he landed at Calais or Boulogne.

**2. Shallow Surrounding Seas.**—The British Isles are the emergent portions of a great shoal known as the Continental Shelf, which stands out seaward from the mainland coast. Precisely as waves grow taller until they break on the foreshore, so the tides, which measure in mid-ocean only some two or three feet in amplitude, are magnified several fold as they pass on to the British shoal. Strong currents are thus generated as the wide British seas alternately deepen and drain low. Cæsar bore eloquent testimony to the influence of our tidal currents in the defeat of his strategy. The British tides, however, have had a uniting as well as a disuniting influence. Streams and streamlets whose mouths in other parts of the world would be mere creeks without fame, in these seas bear the historic names of Thames and Severn, Rhine and Seine. Even in the days of steam motive power, the flow and ebb of the Thames to and past London are worth much money annually—a fact which is one of the chief arguments against the scheme often proposed for erecting a dam below the metropolis and so keeping the water permanently high. What the tides were in the days before steam is evident from the position, many miles from the open sea of such ports as London, Antwerp and Hamburg.

Nor must it be forgotten that the shallow seas around Britain are exceptionally productive of fish. The fishermen of Holland became the carriers from Lisbon to the Baltic, and when Lisbon fell temporarily under the power of Spain, these same Dutchmen extended their voyages to the Indies. To-day, however, the fishermen of England and Scotland are in a great majority on the international fishing grounds of the North Sea, and their powerful steam fishing vessels extend their operations as far as Iceland on the one hand and the coast of Morocco on the other. It is an important fact for a state whose power is on the sea that there are no fewer than 100,000 English, Scotch and Irish who earn their living wholly or in part by sea fishing.

**3. Neighborhood to the Continent.**—Britain would have had small significance in the world had her position been distant from the historic shores of Europe. It is of course true that the ancient writers from Virgil to Shakespeare are full of the remoteness of Britain at the end of the known world. It is true also that until a relatively late period in history Britain did not count among the powers which shaped the destiny of mankind. These very facts however have enabled Britain to play a part in the last two or three centuries which is comparable to that played by the Greeks on the smaller stage of the earlier time. Because of her neighborhood to Europe, Britain was deeply and repeatedly influenced from several distinct quarters, yet because of her insularity was never permanently attached to any one centre of European culture. It has been Britain's function to amalgamate the several elements of European civilization, and then to spread Europe to all the shores of the world. At least four streams of blood—Neolithic, Celtic, Roman and Teutonic—and four linguistic influences, all drawn from across the narrow seas, have gone to the making of

modern Britain. Yet the Englishman of to-day differs generically from all the species of continental European. Britain has been and is of Europe yet not in Europe.

From this point of view it is important also to notice that the hilly parts of the British Isles are in the north and the west—toward the ocean that is to say, not toward the Continent. As a result, the agricultural England of the plain, the dominant partner in the United Kingdom, lies toward the channel, and London is close neighbor to Paris and the Netherlands. History would have been far other than it has been had the hills been in the southeast and the plains in the north and west.

**4. Relation to the Chief Linguistic Frontier of Europe.**—A glance at a map of Europe showing the areas occupied by the several languages would make it clear that the most important linguistic frontier, that between the Romance and Teutonic tongues, traverses Europe diagonally from the Alps, and comes down to the coast in the northern corner of France, within sight of Dover Castle. England has received from the Rhine, the Elbe and the Norwegian fjords her Teutonic language and the rudiments of her free institutions, while she has taken from the Seine, and from the western Mediterranean beyond, her Christianity and her scholarship. Scandinavia on the one hand and Spain on the other possess a geographical separation almost as definitely secure as that of Britain, but Scandinavia is Teutonic and Spain is Romance. Britain has been cross-fertilized from both sources.

Moreover, Britain has re-acted upon the dual Europe with the power due to her position. If the adjoining Continent, with its greater population and greater aggregate wealth, had been united politically, the independence of Britain would have been impossible. As Mr. Peel has shown in his article (see GREAT BRITAIN—FOREIGN POLICY IN RELATION TO EUROPE), we have at most times used our power to defeat every bid for general European dominion. Rome conquered a large part of Europe and she also subdued Britain. Napoleon's aim was to invade England, and England only defeated him by overthrowing his European empire. The task of holding Europe disunited has been facilitated in every age by the fundamental antagonism of Roman and Teuton. Britain's immediate neighbors across the Channel, to-day, as in the time of Napoleon, of Louis XV, of Louis XIV, and of Charles V, are on the Rhine and also on the Seine. In the same connection let us note that in the year 1066, at Stamford Bridge and at Hastings, England exchanged, as Dr. Hodgkin points out (*THE CONQUESTS*) in this volume, a period of Teutonic for a period of Romance influence.

**5. Climate Determined by Oceanic Winds.**—Britain lies further north than any other country of equally old civilization. Great Britain occupies almost precisely the same latitudes as Labrador. The prevalent westerly wind from the Atlantic, and the set of the Atlantic waters from the tropical southwest carry the warmth and moisture of lower latitudes into a great climatic bay over Britain, in which long frosts and long droughts are equally rare. Unlike either the south or the east of Europe, there is labor in the fields at all seasons, for

Britain has neither a Mediterranean summer nor a Russian winter. May not the moral effect of this continuity of effort account for some of the so-called Anglo-Saxon characteristics? Yet the mists of the oceanic air and the long northern nights are often as unfavorable to repose in the open as the other conditions are favorable to work there. Hence a second Anglo-Saxon characteristic, the home round the fireside.

Nor, it must be remembered, is climatic control limited to agriculture and domestic conditions. There are splendid waterways in the wide plains of eastern Germany and Russia, but navigation is there intermittent owing to the long grip of the winter frosts. The rivers of Spain and Italy have abundant volume after the rains and the thaw in the mountains, but they are reduced in the summer to strips of pebble desert. The smaller waterways of England, closed neither in winter nor summer, were long ago made navigable by means of locks.

**6. Internal Natural Divisions.**—Britain is divided into the two islands of Great Britain and Ireland. The same causes which have separated British conditions as a whole from those of continental Europe have of course tended to separate Irish conditions from those of Great Britain, but they have acted with less effect, because Britain by her position has been driven to obtain sea power, and thus for many purposes to remove her frontiers from her own coast to the coasts across the water. Thus Ireland has been strategically enveloped by England, yet because adequate English manpower was lacking in the time of Henry II, Queen Elizabeth and Cromwell, was never completely assimilated to England. Ireland conquered and necessarily conquered, by England, is in the position that Britain would be in if there were a united Europe across the Channel. Had Ireland been an organized kingdom in the early Middle Ages, instead of a group of rival and hostile tribes, she would have supported Scotland against England, would have retained her independence longer, and when modern conditions rendered union inevitable, would have come into the sisterhood like Scotland as an organized force capable of holding her own.

What every map does not show, however, is the coherent area of bleak uplands occupying the centre of the length of Great Britain, and dividing the agricultural lowland of England from the smaller lowland of Scotland. This upland area has no single name, but is known in different parts as the Southern Uplands of Scotland, the Cheviot Hills, the Pennine Moors, and the Lake Mountains. Until a century and a half ago it had but a sparse population, and was in fact a broad natural frontier between the England of London and the Scotland of Edinburgh. This "border," utilized by a people of Teutonic tenacity, was the geographical position from which Scotland for six centuries held at bay the superior might of England. Not a little of the effect of modern British action in the world is due to the interaction of the two national characters thus evolved in antagonism.

The central uplands of Great Britain between England and Scotland are now the seat of great industries, and for most purposes the two countries form a single economic organism. But in the Highlands of Scotland on the one hand, and in the broad upland of Wales on the

other, a remnant of Celtic speech still survives. In all parts of the world there is a marked contrast between the highlander and the lowlander, but this contrast is here increased by that between Celt and Teuton. Formerly marriage was between neighbors, and provincialisms were inbred. But modern facilities for communication lead to distant intermarriages, which are rapidly imparting a national solidarity of blood to states like Britain. This crossing of highlander and lowlander, Celt and Teuton, within Britain must be productive of a change in the race which may prove something far other than the mere striking of an average.

**7. Adequacy of Economic Bases.**—All the proceeding advantages—insularity, shallow surrounding seas, continental neighborhood, linguistic division among rivals, soft climate and internal stimulative contrasts—would, however, have been of little value unless Britain had had length and breadth enough to supply the economic bases for a people able to count among the powers of Europe. It is therefore important to note on the map of Europe a certain rough equality as between the great natural regions—the Spanish, Italian and Balkan Peninsulas; the plain of the Middle Danube; the French land between the Alps, the Pyrenees, the Bay, and the Channel; the north German plain; and the southern habitable portion of Scandinavia. Even the vast Russian plain, after all only partially European, must not deceive by the space which it occupies on the map. North and east of the great bend of the Volga at Kazan it contributes little to the strength of the Russian people. Many advantages and disadvantages, moreover, compensate for such differences of mere area in this bundle of natural regions which we call Europe. Thus there is a rough equality of resource among the tenant nations, and this has sufficed for a balance of power during several centuries.

Until within the last few generations agriculture was the chief economic base of these nations. For the reason given just now—the separation of their agricultural plains—England, Scotland and Ireland were separate economic organisms. Relatively to her population, England was until lately so adequately endowed with land that in the Middle Ages she was the principal exporter of wool, and in the 18th century, of wheat, to the Continent of Europe. The vast improvement of agriculture achieved by the English farmer in the 18th century was one of the chief causes—if not the chief—of the wealth which enabled England to defeat Napoleon. (See GREAT BRITAIN—AGRICULTURE IN THE 18TH CENTURY, by Dr. Knowles).

Though agriculture still remains the greatest single industry, yet by the aggregate of her industries Britain is now an industrial rather than an agricultural country. In other words, she rests on her output of coal rather than of wheat and meat. The change has, however, been fully accomplished only in the last two generations.

The new economic conditions have been variously influenced by geography. In the first place Scotland has been effectively united to England. The barren uplands in the north of England—in the isthmus, that is to say, connecting the two countries—are rich in coal,

and a population has grown up in this part of the island drawn both from Scottish and English sources, and of an intermediate character. Moreover, Scotland, by virtue of her own coal, has been able to share in the advantages of the imperial and economic policies of England. At the time of the union of the two parliaments in 1707 Glasgow was only a village.

The dominance of the trader over the farmer led in the 19th century to a reversal of the long-settled British policy of protection. England and Scotland no longer rest economically on the resources of their own territories. They produce coal, and are the seat of labor and of capital, but four-fifths of their wheat they import, and one-fifth of their people are engaged on manufactures for export. Ireland, however, has very little coal, and must still depend on her agricultural products. Thus, while Scotland and England are now a single economic organism, Ireland—with the exception of Belfast—is another and separate organism. There is an antagonism of economic interest between Ireland and Great Britain which may be compared to the antagonism of interest between the Southern States and the Northern before the Civil War. If in her own interest Great Britain were to revert to her former economic policy, an incidental result in the long run might possibly be to reconcile Ireland to her.

**8. Geographical Momentum.**—We must not however seek to ascribe the present strategic and economic position of Britain in the world, in so far as it depends on geographical causes, wholly to the present action of those causes. There is such a thing as geographical momentum. The causes which originally led to the establishment of a market in a given place may have ceased to act, but the habit of the customers will long compel salesmen to resort to it. London at the present moment is the greatest general store in the world. It has no staple industry, but parcels of almost everything manufactured in other parts of Britain, and, indeed, in almost all parts of the world, are warehoused there. Except for large quantities of staple goods, many smaller communities find it convenient to give their orders and to make their payments in London. Formerly, no doubt, as Emerson has said, England was the great shop-keeping nation had a good stand in the world. Her chief customers were along the European coast opposite. But now part, at any rate, of her influence is due to momentum from the past, to the start given to her during the Napoleonic wars, and by the fact that in the days before railroads she had coal near the waterways.

**9. The Consequences of Sea Power.**—Britain now lives in part on the products of her own land and seas, in part as a manufacturer for other countries, and in part as a market. But she also obtains profit from her position as the chief sea power. By this power she prevents her enemies from uniting, she retains certain open markets, and she protects her carrying trade. Sea power, however, is a condition of the existence not only of the British Empire, but also of the United Kingdom. This was early made evident. When Edward the First conquered the Principality of Wales, he moved the fleet of the Cinque Ports, then the only fleet available for the English king, into the rear of his opponent. This

he could not have done had not the Lord of the Isles been defeated shortly beforehand by the Scotch. For several previous centuries sea power along the oceanic borders of Britain had been in the possession of a Norse state established in the fringe of islands which extend round the west of Scotland from the Shetlands to the Isle of Man. Unless Britain has command of her seas the Shetlands and the Orkneys, and indeed Ireland itself, might be held by the foreigner against her, and the foreign invader might establish his bases even in the remoter peninsulas, say of Scotland or Wales. It was from such a peninsular base at Lisbon that Wellington conducted the war against France at the beginning of the 19th century.

The very need of sea power, or in other words, of the sea itself, renders it impossible to put territorial limits to naval action. Britain can command in the British seas only if she can also command in waters more remote. Her fleets are now concentrated in European waters because her possible naval opponents are there to be found, and for no other reason. It follows, however, that Malta and Gibraltar, the bases of the Mediterranean and Atlantic fleets, are in reality not merely milestones on the road to India, but also outposts for the defence of London. It is this characteristic of sea power, now familiar to all the world through the writings of Admiral Mahan, which renders it necessary for modern Britain—faced by powers that rest upon half continents—to extend her economic bases beyond her original insular territory. Whether this is to be done by the method of increasing the insular factories and holding open the over-seas markets, or by such a federation with her colonies as will in effect base her navy on the agriculture and factories of a wilder land, is yet the issue of British politics—the outcome of many centuries of history in an insular and yet European geographical environment.

**2. THE CONQUESTS.** Two, at least, of the great inrolling waves of conquest, which have left their mark on the people and the institutions of Britain, had spent their force before any historian arose to record them, and are thus for us like the forgotten events of our unconscious childhood. As to these we can only speak darkly and doubtfully according to the scanty evidence furnished by excavations of the barrows in which the bones of Prehistoric Man are laid. Judging from these, we are able to say that in the dawn of the history of Britain, our island was inhabited by a race ignorant of the use of metals, of the manufacture of pottery, and of the art of weaving, but accustomed to the use of stone implements such as wedges, axes and hammers, which they fash-

ioned with considerable skill. This race is one of those called Neolithic, to distinguish them from the incalculably older races of Palæolithic Man, who also used stone implements, but who lived before that mighty parenthesis in human history which is called the Great Ice Age. What the Neolithic inhabitants of Britain may have called themselves we are utterly unable to say. For convenience they are generally spoken of as Iberian, in order to indicate a possible connection with the aboriginal inhabitants of Spain, now represented by the Basques; but this connection is only an ethnological guess and must not be taken as an established fact. The race in question buried their dead in long barrows, the excavation of which shows that they were of short stature, with skulls tending to the long rather than the broad shape (Dolicho-cephalic rather than Brachy-cephalic) and that they were probably black-haired and of dark complexion.

To these aborigines of Britain entered two tall and fair-haired races, both of them probably belonging to that great family of nations which we call Celtic. The first of these invading races wielded weapons of bronze; the second was acquainted with the use of iron, and this may account for their victory over their predecessors. At present the tendency of scholars is to identify the bronze-using people with the Gaels (or as they are now generally termed the Goidels), who have left their chief mark on the populations of the Scottish Highlands, of Ireland, and of Gaul. The wielders of iron would be the race (now called Brythonic) which gave its name to Britain; which occupied the greater part of the southern half of the island when Cæsar landed; which survives under the name of Cymri in the mountains and valleys of Wales; and whose language, once spoken in Cornwall and Cumberland, is the dearest possession of the eloquent Welsh and has a large currency among the peasants of Brittany. As to the date of these several movements accurate information entirely fails us, but it is probable that several centuries elapsed between the arrival of the two waves, the Goidelic and the Brythonic, and that all had been accomplished several generations before the birth of Christ.

It was in the year 55 B.C. that the Roman eagles were first seen on this side of the straits of Dover. Whether Julius Cæsar seriously contemplated the conquest of Britain, or whether his two expeditions in that and the following year were only theatrical performances meant to overawe the tribesmen of Gaul and to dazzle the populace of Rome, is a question not easily answered. It is certain that, if an abiding conquest was his aim, he had greatly underrated the difficulty of the task. His own narrative, much more candid than that of most generals who indite their own bulletins, shows clearly that neither expedition was really successful, that the Britons fought well, that the dense forests of their land, and the chopping tides of their seas powerfully aided their resistance, and that Cæsar himself, after the midsummer of 54 B.C. never desired any closer view of the white cliffs of Britain.

But though Cæsar was foiled, Rome remained and was still the world-conquering city. In the year 43 A.D. when Claudius was Emperor of Rome, an expedition was fitted out for the

conquest of Britain. The commander was the high-born senator Aulus Plautius, and he had under his orders four legions with a proportionate number of cavalry and "allies." The latter were for the most part armed more lightly than the legionaries and were generally stationed in the wings, while the legionaries fought in the centre. The total number of Plautius' soldiers cannot have been less, and may have been considerably more, than 40,000. For 17 years no serious misadventure hindered the onward progress of the Roman arms, though the Silures of South Wales, under their king, Caratacus, kept the invaders at bay for many years. In the year 59, however, we find the Roman general Suetonius Paulinus crossing the Menai straits and conquering Anglesey, and the Roman soldiers quartered at Chester and at Lincoln. Then came (60) a terrible reverse of fortune, the only serious set-back to the Roman career of conquest in these early centuries. Maddened by the tyranny of a grasping Roman official, Boadicea, queen of the Iceni (a tribe inhabiting what is now the county of Norfolk), called her countrymen to arms, sacked the Roman colony of Camulodunum (Colchester) and the cities of Verulamium and Londinium, and threatened to root the Romans out of the land. Suetonius, however, hastened back into the centre of the island and there, giving battle to the far more numerous forces of the barbarians, achieved a decisive victory.

After this the Roman frontier was pushed steadily forward, especially by the famous general Julius Agricola (78-84) till it nearly coincided with that which is now the northern boundary of England. About the year 120 the Emperor Hadrian is believed to have built that noble stone wall from the estuary of the Tyne to the Solway, of which important fragments still remain, forming one of the most interesting memorials of Roman domination north of the Alps. Another wall, of turf, was drawn by Hadrian's successor, Antoninus Pius, across the lowlands of Scotland from Forth to Clyde, but it was probably not maintained for long as a boundary of the empire, and the hold of the Roman legions on any part of Caledonia was always precarious. We cannot now do more than briefly allude to the expedition of the aged Emperor Severus, in which he is said to have reached the northern extremity of the island and carefully noted the duration of the long midsummer days.

Notwithstanding many incursions of the barbarians, and the obviously failing strength of the empire, the 3d and 4th centuries were probably not on the whole calamitous times for the now reconciled and submissive inhabitants of Roman Britain. At last in 383 a general named Maximus rebelled against the Emperor Gratian, assumed the purple robe, and carried his legions into Gaul to enforce his claim. It may be doubted whether the wealthy and timid provincials ever slept soundly after that fatal departure. True, the rebellion was in course of time suppressed, and some portion of the legions struggled back to Britain, but more mutinies followed, Rome itself was in danger from Alaric and his Goths, and at last about 407, the last of the Roman legions quitted the island never to return.

Of the next act in the great drama, the conquest of England by the English, we have

hardly any trustworthy information. The broad outlines of the conquest may be traced. Three tribes of the Low German stock from the shores of the Baltic and the North Sea certainly established themselves here in the course of the 5th century. The Jutes settled in Kent and the Isle of Wight, the South Saxons gave their name to Sussex, the East Saxons to Essex, the West Saxons established themselves in Hampshire and Wilts, the East Angles in Norfolk and Suffolk, the Middle Angles in the Midland counties where they founded the kingdom of Mercia. Deira and Bernicia, the two kingdoms which sometime coalesced into Northumbria, were also Anglian settlements: but how and when all these territorial changes took place we really cannot state with certainty. Even the 'Saxon Chronicle,' which professes to give dates for the foundation of the kingdoms of Kent, Sussex and Wessex, tells us scarcely anything about Northumbria in these early years, and nothing at all about the other three kingdoms.

The ordinary story of the Saxon conquest is thus told. On the departure of the Roman legions the Britons, sore pressed by the incursions of the Northern and Irish barbarians, the Picts and Scots, called on "Ætius, thrice consul," for aid which he was unable to give them. Thereupon they foolishly turned to the Saxon and kindred continental tribes for help. Hengist and Horsa, Jutish princes, came at the call, landed on the coast of Kent, repelled the Caledonians, but refused to quit the country after the work of liberation was accomplished. The infatuated passion of Vortigern, the elderly British king, for Rowena, daughter of Hengist, aided the designs of the invaders, who sent over to the continent for more and ever more of their countrymen till the conquest at least of the eastern half of the island was accomplished.

For the story thus told the evidence is not satisfactory. It chiefly consists of the narrative of a Welsh ecclesiastic named Gildas, who lived a century and a half after the legions quitted Britain, and who, though an earnest Christian patriot, was evidently but slenderly furnished with historical knowledge. Nor do the very meagre details of the conquest which are supplied by the 'Saxon Chronicle' carry us much further. That Chronicle was itself probably not compiled till three or four centuries after the invasion, though some of the material included in it may be of a much earlier date.

On the whole all that we can safely say appears to be that apparently throughout the 5th century a series of attacks on the Romano-British population was being made by the Germanic tribes which the Romans had known by the name of Saxons. These attacks had begun even in the 4th century and, in order to guard against them, the emperors had created a high official who bore the name of "Count of the Saxon Shore." The invasion may possibly have culminated in the year 449, the year assigned by the 'Saxon Chronicle' to the landing of Hengist and Horsa, but there is some reason to think that even that specific event took place eight years earlier. The name of the first West Saxon chieftain, Cerdic, interests us because it is from him that the present royal house of Great Britain derives its origin. His career of conquest, which had been most successful, was possibly stayed about the year 516 by a great

victory which Gildas reports the Britons to have won at "Mount Badon." In the present state of our historical knowledge no one can deny that this victory (about which the 'Saxon Chronicle' is silent) may have been won by a Romano-British hero named Arthur.

About 60 years later (577) the great victory of Deorham, won by Cædwallin, the grandson of Cerdic, once more carried forward the invading flood and finally separated the Britons of Wales from their kinsmen in the district which was then called West Wales, but which we now know as Cornwall.

The Saxon conquest was apparently never an easy one, and became harder and slower as time went on. By the middle of the 6th century, roughly speaking, the invaders occupied all of England that lies east of a line drawn from Berwick to Portland; but it had taken at least three generations to reach so far. Then came the above-mentioned victory of Deorham and the extension of the Saxon border far into Devonshire. In the northwest during the 7th and 8th centuries, the Northumbrian kings cut short the British kingdom of Strathclyde, and perhaps reduced it into a condition of something like vassalage. On the Welsh marches, Offa, the great king of Mercia, in the 8th century, carried the western border of England from the Severn to the Wye, and by a substantial earthwork, some vestiges of which still remain and are known as Offa's Dyke, fixed the dividing line between England and Wales almost in its present position. The actual conquest of Wales and its complete subjection to the English kings had to wait till the 13th century, when it was accomplished by Edward I.

The four centuries which intervened between the departure of the legions and the accession of Egbert are generally felt by the historical student as a wearisome interlude in which nothing is done toward the real business of the drama, the creation of an united England. In truth, no thought that such was the real action of the play probably visited the minds of the chief performers. The invaders belonged to various clans, tribes and communities and though they must have spoken the same or nearly the same language, they had only the feeblest conception of duty toward one common country. Even within the limits of the same race we look in vain for any active principle of brotherhood. Angle seems to war against Angle, and Saxon against Saxon, just as cheerfully as either would war against the other. It is true that the moral conquest which lies outside the scope of this paper, the conversion of the English to Christianity (600-686), did something toward quickening the sense of national unity; but notwithstanding the Church's influence, this was still weak when Egbert ascended the West Saxon throne, nor can he, notwithstanding the ascendancy which he exercised over the other still subsisting kingdoms, be regarded as truly king over all England. It was the terrible Danish invasions and the fact that only one champion, the hero king of Wessex was found able to resist them, which finally established the unity of Anglo-Saxon Britain under the rule of Alfred and his descendants. We call the new invaders, for convenience sake, Danes, but in truth they came not only from Denmark, but from Norway, perhaps from all

the harbors of the Scandinavian seas. In 789 the Danish storm began to blow, and with one or two lulls, it blew for three centuries, till Harold Hadrada lay dead on the field of Stamford Bridge. In the year just mentioned (789) three Danish ships appeared off the coast of Devonshire. The mariners resisted the attempt of the king's steward to levy toll upon them, slew him, and sailed away. Four years afterward came another and more deadly invasion. "The heathen men," says the Chronicle, "miserably destroyed God's Church at Lindisfarne, with rapine and slaughter." This ravage of one of the holiest places in Western Christendom showed the savage heathenism of the invaders and struck terror into the hearts of noble and peasant alike, who saw that no sanctuary could be of any avail when the terrible raven standard of the Danes was flapping in their harbors.

The usual course of one of the early Danish invasions was something like this. When spring days dawned a little fleet of ships, or rather long boats, undecked, with one mast in each, and seats for 60 rowers, would push off from the Danish or Norwegian coast and appear in English or French waters. (It must be remembered that France and Germany suffered almost as severely as England from the Danish ravages). The mariners steered their barks into some estuary, such as that which then severed Thanet from the mainland, and leaving them there under a sufficient guard, spread themselves over the country in quest of horses. When they had thus mounted themselves at the expense of the victim country, they made rapid excursions far and wide over the land, burning towns, plundering monasteries and churches, fighting with and generally defeating the *calldorman* or lord-lieutenant of a county, who at the head of his rustic militia (*fyrð*) came forth to fight his brave but stupid battle of defense. Their enemies accuse them of inhuman crimes: the torture of prisoners, the violation of women, the frightful slaughter of little children; but there is some doubt how far these atrocities can be fairly taken as typical of the general character of the Danish invasions. Of one feature of these invasions there can be no doubt: that is, of the special hostility which they displayed to the churches and monasteries of Western Europe. The historical literature of our country has probably to lament the loss of priceless manuscripts, especially in the convents of Northumbria and Mercia, caused by the ravages of the Danes.

When the summer was drawing to a close, and when the long boats were gorged with the plunder of half a dozen counties, the unwelcome intruders would return to their ships, glide away out of the channel in which they had cast anchor, and for that year the harried and wasted land would see them no more. This, at least, was the case in the first stage of the invasions, for about 60 years after the sack of Lindisfarne. Then, in 851, as the Chronicles tell us, "the heathen men scuttled themselves over winter in Thanet." From that time the invasions of the Danes assumed a more and more permanent character: from mere free-booters they became conquerors: Northumbria and Mercia were bound to their chariot wheels, and the whole of England would have been subjugated by them but for the war of liberation

which was successfully waged against them by Alfred the Great (871-900).

Though Alfred broke the Danish yoke, and although his son and grandson, Edward and Athelstan, triumphantly asserted the supremacy of the English crown over the Danish chieftains who were left in the land, the result of the warlike operations of the 9th and 10th centuries was to cause an immense infusion of Scandinavian blood into the population of England. The Danelaw, as it was called, included the greater part of the country northeast of the Watling street, the old Roman road which ran from London to Chester; and in many parts of this region, notably in Lincolnshire and the East Riding of Yorkshire, the names of places still bear witness by their terminations to the existence there of a large number of Danish settlements. It cannot be doubted that this Scandinavian element when subjected, as it soon was, to the humanizing influence of Christianity, was a most valuable and virile ingredient in the population of England.

Through the greater part of the 11th century the Danish inhabitants of England were kept under by the strong hand of the English kings, and the Danish invasions nearly ceased. Near the end of that century they were resumed, and owing to the portentous weakness of Ethelred and his counsellors, they achieved a greater measure of success than ever before. An archbishop was martyred; six successive payments of tribute were paid in the vain hope of inducing the invaders to cease from ravage; and finally the descendants of Cerdic had to quit the realm, and Canute the Dane sat upon the throne of England. As king, however, the Scandinavian conqueror healed many of the wounds which his countrymen had inflicted as ravagers; and the long and prosperous reign of the Christian Canute marks practically the end of the period during which the Danish pirates were a source of terror to the Saxons. The reign of Canute, however, coincided with one event in the nature of a conquest, not favorable to England. In the year 1018 Malcolm, king of Scotland, won the battle of Carham over the men of Northumbria and thereby succeeded in forcing back the English frontier from the Firth of Forth to the line which it now occupies of the Cheviots and the Tweed. The rich country of the Lothians, which for near five centuries had formed part of the kingdom of Northumbria, was now permanently added to Scotland.

The line of Canute came to a speedy end in the persons of his worthless sons; and thereafter, during the central years of the 11th century, under the reign of Edward the Confessor, there was going forward a peaceful conquest of England by the Normans under favor of the Norman-minded king. In truth there was much to admire in this young Norman race, strong with Scandinavian energy, but refined and liberalized by the memories of Roman culture which still lingered in the shattered empire of Charlemagne. Hard and grasping as the Norman warrior might be—and William the Conqueror was a typical Norman in this respect—he was at this period generally chaste and temperate. His devotion to the Church was not a mere hypocritical pretense, nor was it only testified by the magnificent cathedrals

GREAT BRITAIN

The Tower of London

which he erected. As statesman, as architect, and as warrior, it must be admitted that the Norman knight much outshone the Saxon *thegns* whom he supplanted.

The peaceful conquest of England by Norman influence which had been for a time arrested by the successful rebellion of the half-Danish family of Godwin was succeeded by the bloody conquest of 1066. Many causes concurred toward this event; the utter feebleness of the representatives of the line of Cerdic; an uneasy consciousness that Harold Godwinson, who had been raised to the throne on the death of Edward the Confessor, was no rightful wearer of the West Saxon crown; the long-lasting feud between his family and that of the sons of Leofric; but above all the grievously ill-timed invasion of the Norwegian Harold Hardrada. It was on an ill day for Scandinavia as well as for himself that he landed with his ally, the traitor Tostig, on the coast of Yorkshire. Unable to conquer England himself, and winning nothing from her king but the seven feet of earth assigned for his grave at Stamford Bridge, he nevertheless left her panting and breathless for the encounter with a mightier and unwearied foe.

By the battle of Hastings, England, which had been for centuries closely linked with Scandinavian interests, was wrenched away from that connection, and was forced to revolve in the same orbit with the Latin-speaking races of western Europe. A revival of the empire of Canute, which had bound England, Norway, and Denmark together, was made forever impossible. The eyes of the English king turned henceforth toward Rouen, Paris, Angers, Bordeaux; the lands of the northeast on the far side of the German Ocean were to him a well-nigh forgotten world.

As a matter of tactics the victory of Hastings seems to have been due to William's skilful combination of archers and cavalry. The English forces, though much more imperfectly disciplined and less inured to war than the Normans, stood well at bay for many hours behind the shield-wall which they knew so well how to weave, but they were galled by the thick-flying arrows of the Normans, and were tempted, by the feigned flight of the enemy, to rush down the hill after them. Then did William's cavalry, galloping up, thrust themselves in between their broken ranks, and throw them into confusion from which they never recovered. Since the 14th of October 1066 no foreign conqueror has permanently established himself on English soil, and we may therefore here close our brief and rapid sketch of the Conquests of England.

**Bibliography.**—For prehistoric man, consult Dawkins's 'Early Man in Britain,' and Beddoe's 'The Races of Britain.'

For the interesting subject of British coinage, the great authority is Sir John Evans in his two works, 'Coins of the Ancient Britons,' and the supplement thereto.

For the Roman Conquest, consult 'Cæsar's Commentaries,' (Books IV and V); Tacitus, 'Annals' (Book XIV), and 'Life of Agricola'; Dion Cassius, 'Historia Romana'; the lives of the Roman Emperors, which go by the name of the 'Historia Augusta,' and the History of Ammianus Marcellinus.

For the end of the Roman period consult

Paulus Orosius, 'Histories' (Book 7, Anglo-Saxon affairs). The two chief British authorities are the 'Liber Querculus' of Gildas, edited by the Rev. Hugh Williams, and Nennius, 'Historia Brittonum,' edited by Stevenson for the Historical Society, and by Mommsen in 'Monumenta Germaniæ Historica.' For the Anglo-Saxon side of the same events the chief authorities are 'The Anglo-Saxon Chronicle,' and Bede's 'Historia Ecclesiastica,' both edited by Rev. Charles Plummer. For the history of the 7th century, we may add 'The Life of Wilfrid,' by Eddius in the volume 'Historians of the Church of York,' edited by J. Raine (Rolls Series).

The chief authority for the personal history of Alfred the Great is Asser, 'De Relis Gestis Aelfredi,' recently edited by W. H. Stevenson, who in a convincing manner has vindicated Asser's authority. The works of King Alfred have been published in two volumes, Oxford, 1852-53.

Some light is thrown on the Danish invasions by the Heimskringla (in the Saga Library, edited by Morris and Magnusson), also by Vigfusson and Powell's 'Corpus Poeticum Boreale.' For the Norman Conquest, the chief authorities are Ordericus Vitalis, the 'Roman de Rou' of William Wace and pre-eminently the 'Bayeux Tapestry,' edited by F. R. Fowke, London. Modern writers on the subject are too numerous to mention here, but reference may be made for the Roman period to Mommsen's 'Provinces of the Roman Empire,' (Vol. I of the English translation), and F. Haverfield's contributions to the Victoria County History of England.

For later history it will be sufficient to refer to J. R. Green's 'Makings of England' and 'The Conquest of England,' to E. A. Freeman's 'Norman Conquest,' to Sir James Ramsay's 'Foundations of England,' and to C. F. Keary's 'Vikings in Western Christendom.' But for the whole subject of the bibliography of English history from the earliest times to the 15th century no better guide can be found than 'Sources and Literature of English History,' by Charles Gross, of Harvard University.

THOMAS HOOKIN,  
*Author of 'Italy and Her Invaders,' 'Life of Charles the Great,' 'Political History of England' (Vol. I), etc.*

**3. MEDIEVAL ENGLAND.** The foreign invader had finished his task when the last results of the Norman conquest of England were slowly worked out during the Norman and Angevin periods. For the future the development of the country was to depend upon resources supplied from within. The first stage in this new growth is marked by the reigns of Henry II and his sons. From one point of view Henry II's work was but a continuation of that of his grandfather, Henry I. Recent investigation has shown that few of the characteristic features of Henry II's policy were specifically his own, and that he never departed far from the lines laid down by his grandfather. Yet the use Henry made of the materials thus provided for him constituted a new departure in our history. Dr. Stubbs' well-known description of Henry's reign as a "period of amalgamation" remains as true as ever. Before his days, the English and Norman peoples and English and Norman institutions

remained separate, though side by side. It was the mission of the Angevin despotism to grind down both English and Norman into a common nation with a common set of institutions. At first the process was a mechanical one, for the combination was due exclusively to the will of an absolute monarch, working through the most effective administrative machinery which mediæval times had up to now witnessed. As long as the Angevin despotism remained intact, the English and Norman races and institutions continued to be kept together through this external pressure. But they became accustomed to the new conditions, and when the system of Henry II, which had survived the neglects of Richard I, broke down through the active tyranny of John, the union had become organic to such an extent that it continued, despite the relaxation of the severe pressure which had brought it about.

The most permanent feature of Henry II's work lay in the establishment of the unity of England, and the control of the country by a unified administration dependent upon the central power. Though the upper classes long continued to speak French and to bear French names, they became as English in spirit as their native-born tenants and vassals. Yet neither Henry nor his subjects had any consciousness of the results of his work. Henry selected England for more treatment than he devoted to the rest of his dominions, not because he was an English patriot, but because circumstances gave him greater control over his English kingdom than over any other part of his extensive territories. His own personal ambition was rather to build up a cosmopolitan Angevin empire, than a national English kingdom. This ideal could not be realized because it brought his house into direct conflict with the growing monarchy of France, whose kings were engaged in carrying out over their dominions similar work to that which Henry had accomplished for his island kingdom. With the falling away of Normandy, Anjou, and Poitou from John, and their absorption into the monarchy of Philip Augustus, the Angevin empire collapsed. Henry II's continental possessions had contributed next to nothing toward the development of England, but the work he had accomplished in unifying them had materially smoothed the path by which the French national state was to attain to greatness. The retention of Gascony in the hands of the English kings kept up the friction between the two nations and brought about that hereditary enmity of France and England, which was so characteristic a feature of all later mediæval history. Thus the failure as well as the success of the Angevin rulers had their permanent importance. This was even more notably the case with other aspects of Henry II's policy which may be described as premature rather than as impossible. Conspicuous among these were the efforts of Henry II to enlarge the English kingdom into a monarchy over all the British islands. The conquest of the more fertile parts of Ireland by Anglo-Norman feudal adventurers set up in that island the uneasy dependence of a Celtic people on the English King's feudal vassals which had already been established in southern and eastern Wales since the days of Henry I. Side by side with this, something like a Norman conquest of Scotland

was affected, not so much by the enforced recognition of English supremacy by unwilling Scottish kings, as by the gradual infiltration into the northern kingdom of the system and habit of thought which had gained the ascendancy in Henry's own realm. Even the least successful of Henry II's efforts was not without influence on the future. After the martyrdom of Saint Thomas of Canterbury, Henry II renounced as hopeless any heroic attempt to limit the sphere of the jurisdiction and authority of the Church. Yet his watchfulness in controlling and regulating what he deemed the usurpation of the clerical power was renewed from time to time by the more strenuous of his successors, and finally attained a full triumph in the period of the Reformation. For all these reasons, the reign of Henry II is among the most pregnant of future consequences in all British history.

The personal prowess and contemporary fame of Richard I cannot blind us to the insignificance of his reign in results. His brother, John, was the worst and most unlucky of English kings, but the consequences of his failures and blunders determined the whole future course of English history. John's unsuccessful conflict with Innocent III emphasized that triumph of the Church, which even his father had been unable to prevent. The break up of the Angevin empire, though precipitated by his caprice and neglect, was sooner or later inevitable. More important than either of these was the reaction against his domestic authority, which resulted in the union of barons and people in an effort to limit the autocracy of the Crown. The Angevin despotism had done its best work in bringing about the union of England. Like all despotisms, it was a bad thing in itself, even when necessary as the only alternative to feudal anarchy. In John's capricious hands it did not so much as secure the continuance of the law and order for which England had long been willing to pay a heavy price. When the mass of the English people, abandoning their traditional devotion to the monarchs who had saved them from feudal disorder, united with the baronial leaders to wrest from the unwilling king the grant of Magna Charta, the first faint beginnings of English liberty and constitutional government were already at hand.

Of recent years it has become almost the fashion to decry the importance of Magna Charta. It is easy to see that John, in sealing the charter, thought of nothing but obtaining a momentary respite, and repudiated his act as soon as he found it safe to do so. It is equally patent that the barons who forced John to accept the charter were mere feudalists, careless of all but their personal wrongs and the grievances of their class, and quite unconscious that they were acting otherwise than their ancestors had always acted. Yet emphasizing the unworthiness of these men should not blind us to the significance of their work. However unconscious they were of their high mission, the Fitzwalters and the Vescys were in a very real sense the pioneers of English liberty. The opportune death of the tyrant, the withdrawal from England of the barons' dangerous ally, Louis of France, and the wisdom of the papal legate, Gualo, who accepted in the name of his ward, the infant Henry III, the charter which John had repudiated, insured the permanence

of their principles. For nearly a century the great event of English history is the struggle for the charter. Under the long minority of Henry III the ideas of limited monarchy and constitutional control, which were its essence, had time to assert themselves. When the young king attained manhood, his personal weakness made impossible any effective attempt on his part to carry on the government on autocratic Angevin lines. The aristocratic control of the administration was now secured, though it was long before that control was vigorous or effective. The chief danger to England was that the nobles in resuming their former power might also have fallen back on the old separatist ambitions of their feudal ancestors. Luckily the reaction toward feudalism was slight and easily suppressed. The baronage of Henry III's reign was a very different body from that of Norman times, and only a few isolated individuals still cherished the ancient feudal ambition of each nobleman ruling like a king over his own hereditary estate, and caring nothing for the manner in which the central government of the country was carried on. The barons of the 13th century accepted the unity of England, and accepted the central administration which the Norman and Angevin kings had built up. Their chief concern was to see that the government of the country was under their own control, and not regulated by the king's despotic caprice. Thus the unity of England remained, but the central government was henceforth an aristocracy rather than an autocracy. The barons claimed to be the hereditary counsellors of the Crown. Even a strong king was compelled to frame his policy to their liking, and to admit them into a sort of partnership with him. Under a weak king, like Henry III, the barons aspired to rule the realm as they would. Their moment of triumph came in 1258, when the Provisions of Oxford transferred the administration of the country from the monarch to a committee of 15 barons, without whose counsel and consent the king was not permitted to take any action. Thus the Angevin despotism developed into the constitutional monarchy of later times, though at this stage the only effective limiting force was the baronial aristocracy. Side by side with this constitutional development was the blossoming of every aspect of mediæval life, and which made the 13th century one of the most brilliant periods of English annals. The age of Henry III witnessed the consummation of Gothic architecture; the beginnings of the most spiritual aspects of mediæval Christendom in the orders of mendicant friars; the rise of a new intellectual life in the scholastic philosophy, and the organization of teachers and scholars, called universities. For a long time the political weakness of the reign of Henry III checked the general progress of the nation, but with the revolt of the barons a new political development began.

The purely baronial conception of the English Parliament had hardly been formulated when its inadequacy became self-evident. Even in Norman and Angevin times the authority of the Crown had been largely based on the mute but hearty support which the average Englishman gave to the one power which could maintain order, and save him from the caprice of the local feudal tyrant. The machinery by which this popular backing of the royal authority had

been effected still survived in the popular local courts, and the jury system of Henry II had enlarged the representative principle by affording facilities for representative committees of the shire moots to treat directly with the king or his agents. Administrative convenience and financial necessity brought about during the first half of the 13th century a further extension of the idea of representation. It became not unusual for knights, representing the shires, and burgesses, chosen from the boroughs, to be gathered together in a single assembly to voice complaints, frame laws, testify to ancient customs, and make extraordinary grants of money. Such was the state of things when the narrowness and selfishness of the triumphant baronial oligarchy provoked a strong reaction among their own more enlightened supporters, and gave a unique chance to the broader-minded friends of the monarchy to rescue it from the impotence into which it had fallen. Simon of Montfort, Earl of Leicester, made himself the leader of the former; Edward, the king's son, the future Edward I, put himself at the head of the latter movement. The momentary triumph of Earl Simon over both his baronial colleagues and his royalist enemies was marked by the Parliament of 1265, which, if not the "first House of Commons," was at least the first occasion when the new machinery of representation was applied to the determination of grave political issues. The effect of Simon's work was that the lesser landholders and the citizens were called upon to enlarge the narrow circle which had hitherto alone aspired to control the crown. Though Simon perished within a few months on the field of Evesham, his enemy and supplanter, Edward I, carried on and completed the work. Edward was every inch a king, and loved power too well to abandon any of it willingly. But he dreaded the might of the greater barons and of the still independent Church; he appreciated the advantage of having the people on his side; and he was the first king after the conquest who was in a real sense an Englishman. Up to now the progress made in England had been on lines common to all Christendom. There is nothing specifically English in the Church, the friars, Gothic art, scholastic philosophy, the universities, feudal warfare, or even in the system of representative control of the Crown by the estates. At last under Edward I a newer and more specially national note is sounded. Under this great king the constitutional system became perfected; the council of the nation became permanently strengthened with a popular and representative element; the baronial parliament was enlarged with the three estates of barons, clergy, and commons. Edward I was even less of an innovator than Henry II, but old ideas took new shapes under his direction. The materials of the Constitution had been supplied during the creative period of the barons' wars. His work, as Stubbs has truly said, was a work of definition. Henceforward the main outlines of the Constitution were clearly marked out and defined. As far as outward forms went, they remained as Edward established them, until quite modern times.

The most permanent result of Edward I's work was the creation of the English parliamentary system. Edward's other ambitions were less completely realized. He aspired, with

but little success, to maintain his position in Gascony and on the Continent against Philip the Fair, the greatest of the mediæval Kings of France. He aimed at playing a prominent part in Europe, and checking the ever-growing usurpations of the Church in the political sphere, and at establishing his authority over all the British Islands. In most of these directions he was not very successful, except that by the destruction of the state of Llewelyn of Wales he made the English monarch supreme over southern Britain. Even in his lifetime his attempt to absorb Scotland showed no great prospect of success. Under his unworthy son, Edward II, Robert Bruce's great triumph at Bannockburn (1314) secured the independence of Scotland and made permanent the division of the English race into two unequal halves. So far as concerned internal politics, the reign of Edward II seemed marked by an equally strong reaction. The Lord Earl Ordainers and their leader, Thomas of Lancaster, take us back to the oligarchical atmosphere of the Provisions of Oxford. It was only after their fall that the Despensers identified the triumphant monarchy with the representative parliamentary system. The revolution of 1326, which cost Edward II his throne and his life, perpetuated the constitutional authority of the estates. During the long reign of Edward III, the king's foreign preoccupations made it essential for him to keep on fair terms with his subjects. The subsidies and support, necessary to enable Edward III to carry on the early stages of the Hundred Years' War with France, finally consolidated the constitutional fabric and ensured its permanence.

England had already become a nation under Edward I. During the reign of his grandson Edward III the might of the English state was revealed to all Europe by the extraordinary military successes which laid low the ancient feudal fashion of fighting in famous battles such as those of Crecy and Poitiers. It was now that the English king first aspired to be lord of the seas, and that English mariners and wool merchants prepared the way for the industrial England that was ultimately to supersede the military state that now claimed a great place in the affairs of Europe. It was the age of Chaucer and Wycliffe, when the English tongue and English literature blossomed anew, and when the new nation became impatient of the narrow limits and strict restraints of the mediæval fashions of life and thought. It was in this age that the Church first provoked successful opposition, and first manifested signs of conscious weakness. The ravages of the Black Death, the direst of mediæval pestilences, undermined the old social order and prepared the way for all that ultimately differentiated the social and economical system of England from that of its continental neighbors. Chivalry, whose deeds were glorified in the pages of Froissart, was threatened with decay at the moment of its apparent triumph. The brilliant successes of the French war were succeeded by disastrous failures. In his embarrassed old age Edward III saw the loss of his foreign conquests, and the undermining of his authority at home. During the troubled reign of his grandson, Richard II, the economic troubles of the period culminated in that Peasant Revolt of 1381 which, even in its failure, was to ring the

knell of villeinage and the old social system. As Richard attained manhood, he ventured upon the most serious effort made by a later mediæval king to overthrow the constitutional system, and strove to make himself an autocrat like his ancestors and his contemporaries, the French kings. His boldness drove him from his throne to a prison where he soon met his fate. With the Revolution of 1399 England was brought back permanently to the constitutional path.

The Revolution of 1399 was a conservative reaction in at least two directions. It restored the old parliamentary Constitution and insured the loyal continuance of a limited monarchy by establishing on the throne with a parliamentary title that house of Lancaster, which since the days of Earl Thomas had almost continuously led the constitutional opposition to the sovereign. Under the Lancastrian kings the mediæval constitutional monarchy attained its height. Not only weak kings, like Henry IV and Henry VI, were perforce true to their constitutional obligations. We see the same loyalty even in a strong monarch like Henry V, who was vigorous enough to renew Edward III's claim to the French throne and lucky enough to profit by French divisions and make himself ruler of the more important half of the French monarchy. Under Henry V also the other characteristic feature of Lancastrian policy manifested itself most fully. This was the ecclesiastical reaction in favor of the strict orthodoxy with which the house of Lancaster was as much identified as with constitutional principles. If Edward III and Richard II had trifled with Wycliffe and his followers, Henry IV and Henry V were only content with extirpating Lollardy and all its works. Their policy was made easier by the socialistic and revolutionary extremes into which some of the Lollards had drifted. The early 15th century was not ripe for radical revolution in the Church, and the downfall of heresy was the more rapid and complete since Wycliffe's teaching had never really established itself in popular favor. For another hundred years the majestic unity of the mediæval Church was to be maintained. But even leading churchmen were half conscious that the Church's hold over men's minds was no longer what it had been. The life and freshness of mediæval Christianity were gone, even though the Church remained as rich, as proud, and as outwardly glorious as ever. In its weakness the Church clung for support to the State which in the great day of mediæval religion it had aspired to direct and control. A chief feature of 15th century life is the political ecclesiastic serving Church and State with equal fidelity, but discharging his duty to both masters in a thoroughly worldly spirit.

Lancastrian constitutionalism lasted little more than 60 years, though Lancastrian orthodoxy preserved England from religious revolution for nearly a century and a half. It was soon found that constitutional government under mediæval conditions meant weak government. Power went, not to the people at large, but to the great laudholders. A turbulent aristocracy took advantage of the rule of a weak king to wage hereditary feuds against its rivals and reduce the land to a condition of chronic anarchy. Things grew worse when a revival of French nationality followed the wonderful

deeds of Joan of Arc, and Henry was gradually deprived of the monarchy of France which had been conferred on him in his cradle with the good-will of many millions of Frenchmen. The bloodthirsty heroes of the French war transferred their fierce activity from France to their native land, and the permanent anarchy developed into a generation of intermittent civil war. This is the period of the so-called Wars of the Roses, which, beginning with the first battle of Saint Albans in 1455, went on with occasional breaks until the Battle of Bosworth in 1485. The nominal occasion for these wars was the legitimist claim of the house of York as the true heirs of Edward III, but the real cause of the triumph of York over Lancaster lay not in Edward IV's superior nearness in blood to the common ancestor, so much as in the fact that Edward IV was a strong man who could give the English people the peace and order which were necessary to enable the ordinary citizen to till his farm or transact his daily business. The fall of Henry VI involved the failure of mediæval constitutionalism, and the supersession of a lawless anarchy that adopted the name of liberty by the capable and autocratic rule of a vigorous monarch, who cared little for constitutional forms and everything for making his authority supreme. Family divisions within the Yorkist house and the last expiring efforts of the baronial party retarded the restoration of a strong monarchy after the death of Edward IV and gave the house of Lancaster a chance of reasserting itself. Lancaster was now represented by the Welsh house of Tudor, which on the female side claimed a connection of doubtful legitimacy with the line of John of Gaunt. But Henry Tudor's triumph at Bosworth Field meant not the abandonment but the strengthening of the new system of strong monarchy which Edward IV had first begun. The Tudor despotism continued the Yorkist tradition and made permanent the fall of mediæval constitutionalism. But the middle ages were now wearing themselves out. The Church and the baronage had in turn exhausted themselves, and even the disorder of the Wars of the Roses did not do much to check the growth of the middle classes, and the spread of a higher standard of national prosperity than more heroic earlier conditions had permitted. The Reformation and the Renaissance were at hand, and a new chapter in English history was about to open.

**Bibliography.**—W. Stubbs' 'Constitutional History of England,' in three volumes, gives not only the most authoritative account of the development of the English mediæval constitution, but the most broad and general commentary on the turning points of mediæval political history. More political details can be found in the three volumes of the 'Political History of England,' edited by W. Hunt and R. L. Poole, which cover this period: Vol. II, 1066-1216, by G. B. Adams; Vol. III, 1216-1377, by T. F. Tout, and Vol. IV, 1377-1485, by C. W. C. Oman. For ecclesiastical history, consult W. R. W. Stephens, 'History of the English Church,' 1066-1272; and W. W. Capes, 'History of the English Church in the 14th and 15th Centuries.' Economic history can best be studied in W. Cunningham's 'Growth of English Industry and Commerce,' Vol. I; and in W. J. Ashley's 'Economic History,' Vol. I,

parts 1 and 2. Much information can be gleaned from the unequal but often useful 'Social England,' Vols. I and II, edited by H. D. Traill. Mary Bateson's 'Mediæval England,' 1066-1350 ('Story of the Nations') is very valuable from the same point of view. Among many studies of detached periods, persons and aspects of the subject may be included Mrs. J. R. Green's 'Henry II,' and T. F. Tout's 'Edward I' (both in the 'English Statesman Series'); Stubbs' 'Early Plantagenets,' and Warburton's 'Edward III' ('Epochs of Modern History'); C. L. Kingsford's 'Henry V' ('Heroes of the Nations'); W. Hunt's 'English Church in the Middle Ages,' and R. L. Poole's 'Wycliffe and the Movements for Reform' (both in 'Epochs of Church History'); G. W. Prothero's and C. Bémont's 'Simon de Montfort,' the latter in French; F. A. Gasquet's 'Henry III and the Church,' and the same writer's 'English Monastic Life' ('The Antiquary's Books'); Kate Norgate's 'England under the Angevin Kings' and 'Jack Lackland' are important for the 12th and early 13th centuries; H. W. C. Davis' 'England under the Normans and Angevins' is valuable up to 1272; G. M. Trevelyan's 'England in the Age of Wycliffe'; A. Réville's and C. Petit-Dutaillis' 'Le Soulevement des Travailleurs d'Angleterre en 1381'; J. H. Wylie's elaborate 'History of Henry IV' (4 vols); J. Gairdner's 'Introduction to the Paston Letters,' and the same writer's 'Life and Reign of Richard III.' Sir J. H. Ramsay's 'Lancaster and York' (2 vols.) are a great storehouse of facts for the period 1399 to 1485.

THOMAS FREDERICK TOUT,  
*Professor of Mediæval and Ecclesiastical History, University of Manchester; Author of 'The Place of the Reign of Edward II in English History' (1914).*

**4. THE REFORMATION IN ENGLAND.** There are three main factors in the Reformation. It represents, first, the conflict of the growing spirit of nationality, symbolized by the State, with the mediæval idea of the unity of the civilized world, expressed especially in the Catholicism of the visible Church. Secondly, it embodies the revolt of a laity increasing in wealth, education and intelligence, against the control and privileges of a priesthood declining in enthusiasm, conviction and moral fervor; and, as such, it may also be described as the religious aspect of the political advent of the middle classes. Thirdly, it is an assertion of individuality against a collectivist control over thought, opinion and curiosity. These three ingredients are found in varying proportions in different countries. The second element was obvious everywhere, though it was weak in such countries as Spain and Poland, where a commercial class was almost non-existent. In Germany, where national unity had been shattered in the struggle for empire, and where particularism ran riot in the absence of national control, national feeling, after a momentary explosion in the Hundred Years' War and a transient enthusiasm for Luther at the Diet of Worms, failed to concentrate in practical channels, and individual Protestantism held sway until it too became the state religion of territorial princes. In England all three elements were present, though individuality, or

Protestantism, fought an unequal fight with the New Monarchy and toleration was beaten by an Established Church.

The spirit of nationality, of which the New Monarchy and the Established Church were the outward manifestations, had been stimulated by reaction against foreign influences in the 13th century, misdirected in the 14th toward the conquest of France, and dissipated in the 15th by civil broils. At length it found unity and direction under the Tudors, who frankly and firmly based their power upon new social forces. Feudalism, as represented by the great noble houses, was discredited and trampled under foot; political authority was taken from it and entrusted to lay or ecclesiastical ministers, who, like Wolsey, Cromwell, Cecil, Walsingham, were sprung from the upper or lower middle classes. Order at home and peace abroad were dictated by the interests of these commercial classes. Peace with money was Henry VII's ideal. Even Henry VIII compressed the wars of a reign of 38 years into a few months, and insisted that they should not disturb trade relations with the Netherlands; and Elizabeth's wars were waged for piracy or self-defense. The age of chivalry was gone; wars, if waged at all, were waged with ledgers, not with lances. Men were made esquires and knights in the countinghouse and not on the field of battle.

For these struggles new kinds of brains were wanted, different from those which had designed mediæval castles or coats of arms. The day of the knight had passed away, and to him succeeded the merchant, the manufacturer, the financial expert. These men were as yet unused to political responsibility; they needed training under the Tudors—and they got it. Under that dictatorship Parliament was molded and developed as the instrument of government, and Parliament is the work of the Tudors to an extent which an age nurtured on Parliamentary legends is unwilling to admit. Parliamentary privileges first became real in the 16th century; freedom of speech, freedom from arrest, and control of taxation are conceded, not because monarchy is weak, but because it recognizes that the people are its source of strength. Parliament is the foundation, not the rival, of Tudor power. It is true that in the interests of expediency and efficiency many a time-honored maxim is strained or broken; benevolences are levied, though benevolences had been declared illegal; but that is because benevolences, in the words of a Tudor statesman, "do not grive the common people." Morton's Fork and Dudley's Mills were instruments of extortion, but the operation was not painful to the poor. Dukes and cardinals passed suddenly and swiftly from the palace to the prison, but the man in the street did not pass his time in palaces and generally escaped the prison. The success of a dynasty, whose tyranny has been so loudly denounced, is, in the absence of the usual supports of despotism—a standing army or a vast bureaucracy—only to be explained, on the supposition that, while the vocal classes were offended, the dumb masses were content.

It was the work of Henry VII to base the Tudor throne upon the interests of the commercial classes. His son appealed to national

feeling against a universal Papacy and to lay impatience of ecclesiastical control. But he did not appreciate either grievance until Pope and Church crossed his personal will. The first half of his reign was a brilliant and somewhat tawdry pageant, staged by Wolsey with the effect, if not with the object, of diverting the king's and the nation's mind from more serious matters. In it England played the part of arbiter of Europe with a success due to the wealth left by Henry VII, to Wolsey's diplomatic skill, and to the evenly balanced rivalry between Charles V and Francis I. But the pageant came to an end; wars and subsidies to foreign princes exhausted Henry's wealth (1522); Parliament refused to become the paymaster of Europe (1523); the balance between Charles and Francis was destroyed at Pavia (1525), and Wolsey's influence abroad collapsed. A domestic question intruded into Henry's notice. Catherine of Aragon was now (1527) beyond child-bearing, and her only issue was the Princess Mary. No queen regnant had ever sat on the English throne, and it was popularly thought that they were disqualified. Henry VIII had no brothers, and no nephews except the alien Scottish king, whose title as an alien might be barred at common law. A recrudescence of the struggle for the crown was feared, and various claimants had already been suggested. The prospect was horrible to a generation begotten in the civil wars; and as early as 1514 it was rumored at Rome that Henry would get a divorce because of Catherine's failure to present him with an heir to the throne and of the estrangement between England and Spain. But matters mended in this last respect, and the Princess Mary arrived on the scene; she gave promise of brothers, and Henry was satisfied for the time. But brothers never came, and the idea of a divorce revived. There were precedents enough in Henry's family circle; both husbands of his sister Mary had been released from inconvenient matrimonial ties, and his sister Margaret was no less favored by the Papacy. Henry's need was quite as great as theirs, his merits in his own eyes greater. Anne Boleyn doubtless added zest to the suit, but Henry's anxiety for a wife and not a mistress was due to the state of the succession.

He met with unexpected obstacles. Pavia had made not only Francis but also Clement VII practically the prisoner of Catherine of Aragon's nephew. Charles cared little for his aunt, but it was a matter of vital importance to him that a princess who was half a Spaniard should sit on the English throne and secure England for the Spanish instead of the French alliance. His control over Clement would make a divorce harder for Henry VIII than it had been for Louis XII, Henry IV of Castile, Margaret, Queen of Scotland, or the Duke of Suffolk.

For a time, indeed, success seemed possible and near. France recovered from Pavia and sent an army into Italy. Charles's star seemed on the wane; Clement was freed and Campeggio was sent to England in 1528 with a commission ample for Henry's requirements. But appearances were deceptive; the French hope failed; Campeggio was ordered to do nothing except pass the time till the fortune of

war should decide the divorce. In 1529 Italy became imperialist and Clement with it; Campeggio was recalled, and the case revoked to Rome. As Wolsey said, this meant not merely his own fall but the ruin of the Church in England. He alone stood for 15 years between it and its enemies. The Parliament of 1514 had anticipated some of the demands of 1529-36. The unpopularity of the Church alarmed ecclesiastics at that time, and men knew well enough that the Crown had only to abandon the Church for the Church to fall. Doctrine had little to do with this antipathy at first. It was the privileges, the perquisites and the power of the Church which excited discontent; not its ritual or its dogma. The laity were Catholic and they did not object to persecution; but they did object to persecution by priests; they wanted lay control of the penal machine, and they envied the wealth of the Church. In spite of theological appearances it was a commercial and utilitarian age which saw no advantage in vast endowments for contemplative monks or for non-reproductive purposes, and in holy-days on which men were precluded from the pursuit of wealth. There was moreover the sentimental grievance against Papal power which was the tool of a national enemy, and the growing spirit of nationality caused everything foreign, and especially a foreign jurisdiction, to be regarded with suspicion.

The first thing Henry did in 1529 was to turn out his ecclesiastical ministers, and put laymen into their places. This restored harmony between Parliament and the government; and although there were occasions on which Henry VIII came into conflict with the Reformation Parliament and had to give way, both were bent for different reasons on "reforming" the Church in the sense of reducing its power. The foundation of that power was the Papacy, an institution beyond the reach of national control. The Church in England could never be curbed so long as it drew support from an independent authority. Nor indeed could a reformation, in a more legitimate sense, be effected by any other means than the national state. General councils had failed; Popes had ceased to try; the acts of a national Church acting independently of the Papacy would be *ipso facto* void. Not a monastery could be dissolved without the Papal sanction; and Archbishop Warham said that he was merely commissary of the Pope, exercising as *legatus natus* a jurisdiction which he did not possess as primate. The national state was the only authority which could act independently of the Pope. The Reformation was therefore a revolution carried out by Acts of Parliament at the expense of the Church. By the successive acts of Annates, Appeals and Supremacy the financial and jurisdictional rights of the Pope over the Church in England were transferred to the king; the Church was nationalized by the substitution of a national for a cosmopolitan head, and it became the Church of and not the Church in England.

Such a transformation was incompatible with the continued existence of the monastic orders. They were a negation of the national principle, being essentially international in government and in spirit. They had secured exemption from every sort of national control;

and their immediate subjection to the Papacy caused them to be regarded as in a special sense the militia of the Pope. This was the ultimate cause of their dissolution, as opposed to their reform. The necessity for reform was admitted by a Papal commission in 1537, but Henry VIII and Cromwell assumed the case for mending the monasteries to be a case for ending them. They were also useful as a gigantic bribe to induce the upper class laity to concur in Henry's measures and support them after his death; but this use of monastic endowments forbade their devotion to educational purposes, and from this point of view an unequalled opportunity in English history was sacrificed.

So far as doctrine was concerned, Henry VIII made comparatively little change, though the denial of purgatory in 1536 cut deep at the root of the Catholic system and there were indications that the king was preparing for further changes in 1546-47. But the general impression was, as Hooper said, that the king had destroyed the Pope but not Popery; the doctrinal reformation was the work of Edward VI's ministers. Protector Somerset's changes were comparatively moderate and are represented by the first Act of Uniformity and the First Book of Common Prayer (1549). The latter especially was a compromise and its design was to open the door for the new learning without closing it upon the old. The definite breach with Catholicism came when Somerset had fallen as the result of his sympathies with the peasants in their protest against enclosures. Northumberland, who engineered the reaction against the Protector's liberal policy, played for the support of the extreme Protestants on whom alone he could rely in an attempt to exclude the Princess Mary from the throne. In 1552 by the Second Act of Uniformity and Second Book of Common Prayer the door was definitely shut on Catholicism; but so far as inspiration was sought from the Continent and not from Wycliffe, that inspiration was Zwinglian and not Calvinistic. It was not till the Marian exiles returned from Geneva that Calvin began to exert an appreciable influence on the Church in England.

Northumberland's championship was enough to ruin any cause; and the identification of Protestantism with his harsh and violent rule involved it in a discredit from which it was only redeemed by the blood of the Marian martyrs. Queen Mary came to the throne as a representative of the Tudor tradition against a self-seeking revolutionist; even her Spanish marriage was based on the approved policy of alliance with the House of Burgundy, and in religious matters few dreamed at first of anything more than a return to the system of Henry VIII. Wyatt's ill-advised rebellion, the truculent spirit of Mary herself, the character and conduct of many of the Reformers were responsible for the persecution which reached its height in 1555-56. It involved a gross miscalculation. Englishmen of that day were not squeamish, but no generation in England had witnessed anything like the burnings of Queen Mary. They rehabilitated instead of discrediting the Reformation; and the subsequent popularity of Foxe's 'Book of Martyrs,' with all its exaggerations, is proof of the impress of

the persecution on the national mind. It was deepened by the association of this violent policy at home with weakness and disaster abroad. Tudor prestige depended largely upon the figure they cut in Europe, and Mary's well authenticated remark about Calais illustrates her appreciation of the failure of her policy. Her fate was hardly less tragic, though more deserved than her mother's.

Elizabeth personified the revolt from Rome, but not a Protestant or a Catholic theology. She was purely a *politique*, and if she ostentatiously kissed the Bible in the street on her way to coronation, she was careful to show the crucifix in her private chapel to her brother-in-law's ambassador; and the ambiguity of the Ornaments Rubric had its value in international politics. That the late persecutions would cease was certain, but all the rest was made as doubtful as might be to the prying eyes of the foreigner. It was, however, largely a diplomatic pose adopted by the queen, partly to parry a real danger and partly because it was of the essence of her nature to shirk responsibility. The wonderful unanimity with which the bishops refused to countenance Elizabeth and her ecclesiastical settlement shows that they were under no misapprehension. That settlement was no mere return to the Anglo-Catholicism of Henry VIII; it did not go so far as the second Prayer Book of Edward, but it went a good deal farther than the first. Nor was repudiation of Catholicism so novel or so dangerous a thing as in Henry's reign. By the Peace of Augsburg (1555) the empire had resigned itself to the public licensing of heresy. Calvinism was planted in the heart of Europe; the revolt of Scotland from the Papacy withdrew a thorn from England's side, and civil war in France placed another Catholic country *hors de combat*. Spain alone could think of a Catholic crusade, and Philip II soon had enough to do with heretics and rebels in his own dominions. Elizabeth had more to fear from plots than from invasion, and her main task was to keep her subjects in a state of tolerable suspense until the financial and military weakness of the realm had been repaired. State and Church had become so closely interwoven that national unity was thought to require some sort of ecclesiastical uniformity. But it was to be one of externals principally; men must go to church on Sundays, but Elizabeth boasted that she made no windows into men's souls. It was, however, impossible to avoid religious persecution when one religion involved a royal, and another a papal supremacy over both Church and State; and religious persecution went on in England until the Church practically abandoned politics and the State theology.

The plots against Elizabeth were, however, almost as much political as religious. The Bull of Deposition (1570) was a convenient screen; but even Philip II did not launch his Armada until Mary Stuart had left him her claims to the English throne and Drake had goaded him into fury by attacks on Spanish trade. The northern earls who rebelled in 1569 were fighting the fight of expiring feudalism as much as of the Counter-Reformation; nor is it easy to believe that the Catholic religion was the sole concern of the queen who married the Protestant Bothwell according to Protestant rites.

The political chessboard was divided into national and religious squares, and the moves were often complex; for while the bishops were supposed to keep to their own color, the rival queens and their knights might move on either. From the dynastic point of view Elizabeth was handicapped. Precluded from matrimony by a physical defect, she had to leave the succession to look after itself, and makeshift with suitors. She prolonged this game almost beyond the limits of public decency; but it was done with inimitable skill and gave England an invaluable breathing space of 30 years. At length the success of Parma in consolidating his power in the Southern Netherlands (1580-84) and the stroke of fortune which gave Philip the Crown of Portugal with its colonial empire, its harbors and its navy (1580) induced him to make a bid for the title of which the death of Mary Tudor had deprived him, and the death of Mary Stuart had left him heir. It was a forlorn hope from the first. Philip's failure in the Netherlands might have warned him of the odds against him under circumstances far less favorable. There is no reason to suppose that Philip would have been successful even if the Armada had disgorged its hosts on English shores. Drake and his colleagues saved England not from conquest but from a bloody and perhaps a long drawn struggle fought on English soil.

With the defeat of the Armada the work of the Tudors was done. Their dictatorship was the result of an emergency at first domestic and then foreign. So long as the danger lasted of internal disruption or external attack, Englishmen acquiesced in the despotic maxims of *droit administratif* and Roman civil law. The people supported arbitrary government to avoid a greater ill; but with the danger there passed the need and the inclination to subordinate self-government to national security. Elizabeth lingered a few more years on the stage, but she was losing touch with her people. Her waywardness, as Parliament told James I, was only tolerated because of her age and her sex, and the Commons were girding themselves for their hundred years' war with the crown.

ALBERT FREDERICK POLLARD,

*Professor of English History in the University of London; Author of 'The Reign of Henry VII from Contemporary Sources' (1913-14).*

**5. ENGLISH HISTORY OF THE 17TH CENTURY.** The intensely dramatic nature of the events of the political life of England in the 17th century has led every English and American historian to attribute to the period an exaggerated importance. The generally accepted view held by these historians is that the Stuarts attempted to perpetuate or to live up to the pure type of Tudor despotism, and that partly because of their want of personal popularity, and partly because of the silent growth of national self-consciousness, the attempt was a failure; and that as a consequence the century witnessed the definitive overthrow of the Tudor system of paternal despotism—an overthrow in which the chief operating factor was the Great Rebellion.

Such a view involves a serious misconception of the real nature of the problem which the century had to solve and at the same time a still more serious misconception of the actual constitutional advance which that century achieved.

The real problem which the century had to solve was not the setting up of one ideal of state or government upon the ruins of another ideal. History does not concern itself with ideals. It concerns itself with men and things—men who are flesh and blood and intensely practical, and things which are more sternly practical still—such things as, when they mount the saddle, ride mankind. The real problem of the century was how to bridge over the gulf between the executive and the legislative.

Under Elizabeth the central power from which the whole executive machinery radiated was the Privy Council. That body was simply a small permanent Council of Government or Council of State. With the sovereign at its head, it was the government. The whole executive administration of the country rested upon it. Without dividing itself up into committees at all, but simply sitting together as a single and permanent body, this Council decided each and every question of administration, whether relating to the land forces, the calling out of the militia, their equipment, and the whole plan of any military operations, or to the naval forces, including the arranging of transport, the making of contracts with the victualler, and the strategical distribution of men and ships, or again to diplomacy, including every species of

confidential letters and instructions to ambassadors and agents abroad, or again to finance, including especially a most strict control of issues out of the exchequer, or finally to every branch of internal administration and law, the main channel of communication in this last instance being the justices of the peace in the counties.

Where does the Parliament, England's glory, come in in such an enumeration? The answer is simple. It finds no place whatever in it. And if Elizabeth, to take her for the moment as the type, had been able to live off her own, as the kings of England were then supposed to do, never a word would have been heard of a Parliament. So long as it could pay its way the executive was efficient and sufficient without the Parliament. During the 44 years that Elizabeth reigned she called 13 Parliaments at irregular periods but with an average interval between each of more than three years. These Parliaments sat as a rule about two months. The total aggregate period of session of the whole 13 Parliaments was less than 34 months. So that out of the whole 44 years of her reign the Privy Council or executive had uncontrolled management of the nation for nearly 42 years. Nor would it be correct to say that during the remaining two and a half years the executive was confronted by the Parliament. That body was called simply for the purpose of supplying the government with money. Having dutifully voted its tenths and fifteenths it was allowed to legislate on non-contentious matters and was then dissolved. In the whole of the statutes of Elizabeth's reign there is not one of any constitutional importance. More than this, not the slightest attempt was ever made by the legislative to extort from the executive an account of the expenditure of the money thus granted by the Parliament. Once the subsidies were voted there was an end of the matter as far as the two Houses were concerned.

After James I came to the throne this docile attitude of the Parliament to the executive gradually changed. The important point about this change of attitude is not the cause which brought it about, but the form it took, the way in which it expressed itself. That expression is focussed for us in the terms of the Great Contract, the failure of which led to the dissolution of James' first Parliament in 1610. In this bargain of the Great Contract James' position was comparatively simple. In the first year of his reign the Parliament had granted him for life the subsidy of tonnage and poundage. That grant practically put him in the same position financially which Elizabeth had been in throughout her reign. His revenue (from Crown lands, royalties, casualties and customs) was his own. He was expected to live on it, and by that phrase was meant that out of his own he should provide for the whole government of the country—regal, legal, civil, military and naval. If debts arose or extraordinary occasions demanded, he would have to ask for extra grants of tenths and fifteenths just as Elizabeth had been obliged to do. These extra grants Parliament never refused to the Virgin Queen nor did James' first Parliament refuse them to him. But James tried for something more than this. He tried to get an increase of 'his own,' of his life revenue, that standing, permanent ordinary revenue out of which he had to defray the ordinary expendi-

ture of the State. Nor was the Parliament indisposed to meet him. It accepted the general principle of his demand, and agreed tentatively to increase his life revenue by £100,000 a year on certain conditions. These conditions embodied the Parliament's demands on the subject of their grievances, the impositions, such oppressive royalties as purveyance, and certain ecclesiastical complaints.

Stretch or construe these points as we will we shall not find in them anything in the nature of a challenge from the legislative to the executive. All the points which the Commons demanded were to be conceded by the Crown as a matter of bargain. They were to be voluntary sacrifices of prerogative on the part of the king in return for so much cash. When carried out, the executive was still as before to occupy the whole governmental field alone. No part whatever of that field was it for a moment in the Parliament's mind to itself occupy or usurp. It never dreamed of demanding some control over the executive, or even the slightest share in it, either by requesting to be consulted in affairs of state, or by claiming the appointment of any of the king's ministers. The executive was the king's, the ministers were the king's, his completely and his alone, and Parliament never once thought of challenging such a flower of the prerogative. Had the Great Contract gone through the only difference would have been that for the future the king's executive would have agreed to avoid certain acts or to cease the exercise of certain rights of prerogative which had been felt as a grievance. For the rest the executive would have been stronger, not weaker, by the compact, for it would have been better able to pay its way, and so to avoid frequent appeals to the Commons.

Equally noticeable with the subject-matter of the Great Contract was its form. The negotiation was carried on as if it were a treaty between two foreign and totally unrelated powers. The want of connection between the two parties to it could not have been more complete if the king had belonged to one country and the Parliament to another. And between these two parties, the executive and the legislative, the Crown and the Parliament, there was not even a regular and recognized channel of communication. Practically the only means of intercourse was a direct message or speech from the king on the one hand or a petition from the Commons on the other. For the rest all was haphazard. Such members of the executive as sat in the House acted individually each as he thought fit, or as he was bidden, in promoting the king's business. On its side the court party or the executive had no more thought of creating and working some piece of machinery by which the king's business could be piloted smoothly through the House than the House had on its side of ever challenging a share in the executive. There was a gulf between the two which neither side dreamed of permanently bridging over. On neither side did the slightest conception exist of a Constitution in which the executive and the legislative should be linked together.

It was the problem of the 17th century first of all to perceive the necessity of such a link, and then to invent the mechanism. If this statement is a correct diagnosis of the true bearing of English 17th century history, then

the constitutional importance which has hitherto been attributed to that history will be found to be exaggerated. For the simple fact remains that the clear perception of the need was only attained at the close of that century, and the mechanism itself was only gradually elaborated in the 18th century.

Fortunately or unfortunately the Great Contract broke down, and from that moment commenced that antagonism between Crown and Parliament which was destined to produce the Great Rebellion. The steps by which that antagonism developed itself until it blazed out in open war need not be detailed here. They are the commonplaces of history. The point to notice is that the moment the antagonism emerged the opposition of Parliament to executive, or of nation to Crown became not so much constitutional as political. What is the distinction between these two terms? The difference is fundamental, for whilst the one is a matter of principle and abiding, the other is a thing of time and place, and may be transitory. Had the nation said to James through Parliament as its mouthpiece, "You represent and wish to perpetuate the Tudor type of government by prerogative; we have outgrown that and claim for ourselves a share of the government," such an attitude would have been constitutional. But nothing of the kind was either said or thought of. The opposition which developed itself was conditioned in its form by the mere force of circumstance. When, after 10 years of rule without a Parliament, James in 1621 summoned his third Parliament, there were reasonable prospects of a complete agreement. The House, glowing with Protestant fervor, made not the slightest reference to the old burning question of impositions. It sat down at once to consider supply for the support of a war in defense of the Palatinate. For the first fortnight of the session James could have done anything he pleased with the Commons. Ten months later, in December 1621, after with his own hands tearing out of the journals the Protestation of the Commons, the king dissolved the Parliament in anger and sent three of its members to prison. How could so complete a change have happened? The answer is simple. The Constitution provided no mechanism by which James could explain to the Parliament his foreign policy. He could not, nor would he if he could, take the whole House into his confidence, and he never thought, any more than did the House itself, of such a device as that of taking a select few of the leaders of the Commons into his counsels. Nothing is more remarkable in this Parliament than the scrupulous regard which the House paid to the king's prerogative in the matter of foreign affairs. It was for the king, and the king alone, to make treaties and to decide peace and war, nor could they press him to disclose his policy. Had the Commons felt as certain of the patriotic and Protestant trend of James' foreign policy as the Parliament of Elizabeth's days had been of her foreign policy, not a word of criticism or contention would have been heard. But they were not so certain, and as a consequence felt that they were being called upon to vote supply for a policy which might even be the very opposite of that which the nation yearned for. Then a side issue arose. In his impatience at the slightest doubt being cast

upon his foreign policy James was led to assert his view of the prerogative in so dogmatic a way as practically to deny free speech to the House. To this the House of Commons replied by the Protestation, in which they claimed practically nothing but the parliamentary privilege of freedom of speech, just as it had claimed it in Elizabeth's day. This, and this alone, was the cause of the breach.

Will anyone contend that there is anything of constitutional principle in this? If the Parliament had said "We demand to know what your foreign policy is, and that it is in accordance with our views before we vote supply," there would have been constitutional principle involved. But over and over again the Commons disclaimed any such idea. If James was antiquated in his devotion to the Tudor ideal of prerogative the Parliament was just as antiquated as he in their devotion to it, for they distinctly admitted his view, and when they joined issue with him it was on the minor point and on the lower plane of parliamentary privilege.

A remarkable change, however, though transitory as it proved, came over the scene as James' reign came to a close. For some unexplained reason his powers decayed whilst he was still young, though he died at the age of 59. Whether it was due to this premature decay, or to his own intense chagrin at the failure of his long negotiation with Spain, we cannot say. But certain it is that for the last two years of his reign he was a mere tool in the hands of Buckingham. Had it not been for this senility it is certain that the astounding constitutional departure which marked the career of his last Parliament would never have been enacted. James met that Parliament with the practical confession that his foreign policy had been a failure, and he invited their co-operation in the evolving of a policy to take its place. He informed the Houses that his secretaries would tell them the whole story of the marriage treaty with Spain. After they had heard the story, he continued "I shall entreat your good and sound advice . . . I assure you you may freely advise me, seeing of my princely fidelity you are invited thereto."

The marvelous thing about this sudden and revolutionary surrender of prerogative by James is that it sprang from the dictates of Buckingham. But more extraordinary still was the sequel. Following the dictates of the imperious favorite as tamely as a sheep, James, after receiving the advice of both Houses, informed them that if they made him a grant for a war they might appoint their own treasurers to see to the spending of the money, and further "I promise you on the word of a king that although war and peace be the peculiar prerogative of kings, yet as I have advised with you in the treaties on which war may ensue, so I will not treat nor accept of a peace without first acquainting you with it and having your advice." (8 March 1624).

Accordingly when 12 days later the Commons voted three subsidies and three-fifteenths, the money was ordered to be paid to treasurers appointed by Parliament and not into the Exchequer; and at the same time the Houses in an address to the king plainly laid down the object for which the money was voted.

In the whole course of 17th century history,

including the civil war and regicide, there is no more revolutionary incident than this complete, sudden, uninvited surrender of prerogative on the part of James. Had it happened as the result of deliberate thought, and whilst James was still in his prime, it would have shortened by more than a century the birth throes of modern constitutionalism, and have saved the Stuarts from exile.

But it did not so happen. It was a momentary inspiration of Buckingham's, the genesis of which is to be explained by the favorite's own personal position and policy at the time, and it was by him forced upon the feeble king with an impetuosity that swept everything before it. But as with all Buckingham's inspirations, it was no more than a flash and almost as soon over. After the old king's death the versatile but unstable minister made one or two disingenuous efforts to revert to such relations with the Commons. Through the mouth of his creature, Sir John Coke, he submitted to Parliament in July 1625 a rough statement of the expenditure of the subsidies granted in 1624 and again in the following month of August 1625, when the Parliament was sitting at Oxford because of the plague, the lord treasurer made a similar statement. But further than this the concession was not carried. From the position which James had adopted in 1624 Charles gradually receded, not so much from deliberate design as from the mere force of circumstance and from a growing perception of the revolutionary consequences which that position entailed. The desire on the part of the Commons to inquire into the expenditure of the subsidies led them to utter their opinions on the merits of Charles' foreign policy, and in particular to call into question the advice given to the king by the Council of War as to that expenditure. The moment this was clear to Charles any further surrender of prerogatives was impossible. Backed by the king the members of the Council of War refused to reply to the interrogatories of the Commons. Their resistance proved successful. Before the determined attitude which Charles thus took up the House quickly receded and dropped any further attempt at pressing the interrogatories. (March 1626).

With this incident practically ended the whole two years' episode of attempting to take the Parliament into partnership with the executive by means of a voluntary and undefined surrender of prerogative. Had the king allowed the members of the Council of War to answer the interrogatories of the House the principle of ministerial responsibility (that is, the responsibility of the executive to the Parliament, and not to the king alone) would have stood forth in abrupt nakedness. When Charles resisted that demand the emergence of such a principle was postponed for a century. For be it borne in mind, the impeachment of Buckingham, and the later proceedings against Strafford, Clarendon and Danby never advanced the enunciation of that principle a jot. The mere punishment of a minister great or small does not imply ministerial responsibility in our sense of the phrase. All through the 17th century the ministers were the king's servants and were responsible to him, their master, alone. After the exile of Clarendon the Commons did not demand to be consulted as to the choice of his successor, or as to the policy of his successor.

Charles had simply sacrificed one of his servants. That was all. Then he engaged another servant to do exactly the same things and went on as gay and as unconcerned as before.

But had the episode of 1624-26 ended differently the acceptance of the principle of the responsibility of ministers to Parliament as well as to Crown would have led inevitably to the forging of some such link between the executive and the legislative as only came generations later. From the moment such a link had been forged questions of adequate supply for the services and of a proper audit, and again questions of the personal liberty of the subject, of habeas corpus, and what not, would have solved themselves harmoniously. For the participation of the Parliament in the executive would have insensibly tinged the spirit of the whole administration of the country. As compared with the evolution of such a principle the petition of right, habeas corpus, nay, even the revolution itself, are minor incidents.

The remainder of the reign of Charles I, when he ruled without a Parliament, the outbreak of the Civil War, and the consequent military despotism of Cromwell are devoid of constitutional significance. The rule of Oliver Cromwell was a despotism as pure as that of the Tudors, the only difference being that the prerogative of the Crown, which had formed the ultimate sanction of the executive government of James I and Charles I was replaced by the naked power of the sword. The quarrels between Oliver and his Parliaments were in substance and essence the same which had been fought between Charles and his Parliaments. They one and all turned upon the question as to whether and how far the Parliament, the legislative; should thrust itself into the domain of the executive, notably, of course, but not solely, in the matter of the command of the forces. To any such demand Oliver's reply was a much more peremptory, indignant, instantaneous *non possumus* than ever James or Charles could have uttered. And when the sword fell from his dying grasp and the succeeding anarchy swept away the chances alike of his dynasty and of pure republicanism, the Great Rebellion had become a mere tale that is told. When Charles II returned at the Restoration in 1660 the Stuart dynasty reassumed the inheritance of an undiminished prerogative, one that is in no whit distinguishable from the prerogative wielded by Elizabeth, James I, or Charles I. He was granted a revenue for life which might, had it been fully realized and carefully husbanded, have made him independent of the Parliament. He was left in uncontrolled possession of the executive. His ministers were his own, nominated by him and responsible alone to him. His revenue was his own, to spend as he pleased, without the slightest restriction in the way of appropriation. His foreign policy was his own, he could make war or peace or treaty unquestioned, and as he chose. Had it not been for the outbreak of the Dutch War it is probable that his reign would have witnessed no parliamentary incursion upon his prerogative. As it was, when under the strain of the shame caused by the first Dutch War the Parliament did actually make an incursion into the domain of the executive, the novel departure took exactly the same form which it had taken in 1624 under James I. No more speaking comment

than this could be passed upon the fruitlessness and futility of the intervening period of civil war, regicide and revolution.

The full story of the episode in question is too long to be given here. It has been treated fully in the introduction of the second volume of the 'Calendar of Treasury Books.' In brief, what happened was this: With the full consent of the executive (Charles himself) the Parliament in voting supply for the Dutch War appropriated that supply specifically to that war. The necessary corollary was that a few months afterward the Commons were driven to demand an account of the expenditure of that supply. Had the war been successful there would have been no boggling over such an account. But the war had not been successful. It had brought with it disaster and humiliation, and men's minds were correspondingly inflamed. But even so, the action of the Commons was astonishingly mild. Although the inquiry might have led the Commons to cover the whole field of administration and to question the whole conduct of the executive during the war, the Parliament practically in the end restricted its attention to the question of the auditing of the accounts. Charles at first resisted the proposal as a breach on his prerogatives; but in the finish, with his usual subtle adroitness, he gave way.

The immediate outcome of the inquiry was in great measure the exoneration of the executive from the suspicion of financial dishonesty. But the immediate result is insignificant by the side of the ultimate results. On the one hand it furnished a now unchallengeable precedent for appropriation of supply and for audit of accounts; and once the right of auditing accounts should be fully conceded, the further right of questioning the conduct and policy of the executive was bound to follow. Once that consequence was fully established the gulf which sundered the (king's) executive from the (people's) Parliament was narrowing and a bridge was being built over it. The Parliament was coming to identify its interests with those of the executive instead of maintaining an attitude of permanent aloofness or even hostility. Of the two parties to this conversion the Parliament itself was slower of comprehension and more unwilling of movement than the Crown. For to identify itself with the administration was to forfeit all the vantage ground of complaint and agitation on which it had stood in the past. Accordingly the change did not actually accomplish itself in Charles II's time. For the rest of his reign the parliamentary opposition was swayed by motives which were merely and purely factious. But as the century drew to a close the gulf was in great measure bridged over, and in the course of the 18th century the new structure was perfected. The executive ceased to be the personal property, appanage, officialdom of the king. It became identified with the parliamentary system through the device of parliamentary departmental heads; and the practice of annual estimates took the responsibility for the financial administration of the country from the shoulders of the king, and laid it upon the broader shoulders of the Parliament. From that moment the development of English constitutional and political life has been smooth and harmonious.

But these ultimate results lay unfolded in

the bosom of the future. To Charles II the Commission of Accounts taught another and quite different lesson. It taught him the art of parliamentary management, not merely how to buy off the opposition, but also how to organize his own friends in the House. Danby's corrupt leadership of the Parliament, and the various devices employed to influence the constituencies on the one hand, and Sir William Temple's scheme of a reorganization of the Privy Council on the other, are but manifestations of this side of Charles' statecraft. Thanks to this statecraft of parliamentary management, Charles remained easily master of the situation for the rest of his reign, and when he died he left to his brother a prerogative as unimpaired as that which James I had wielded—complete control of the executive at home, complete control of the forces, complete control of the foreign policy of the nation.

From the point of view which has been thus expounded, what was the historical significance of the Revolution of 1688? In a sentence it lies not so much in the direct challenging of prerogative as in the quiet, undefined, unobserved usurpation of it by the Parliament. In the first place the Parliament voted a standing revenue of £1,200,000 for the support of the Crown in the time of peace. This was exactly the sum which the Restoration Parliament had granted Charles II in 1660. But whereas in 1660 that sum was meant to cover the complete national expenditure, civil and military alike, the details and management of which were left absolutely unchallenged in Charles' hands, the vote in 1689 was intended only for the civil establishment in time of peace. Immediately after this vote the Parliament proceeded to consider the question of separate supply for the army, navy and ordnance, and in order thereto detailed estimates of the charge of the army and navy were laid before the House.

Herein lies the Great Revolution—not in the clauses of the Bill of Rights. For the moment the Parliament realized that the provision for and regulation of the army and navy was its province it had assumed to itself half the domain of that kingly prerogative which had endured through Tudor and Stuart times. It had stepped over the gulf which had hitherto divided the domain of the executive from that of the legislative. Once this first step had been taken, there remained only the problem of evolving the machinery by which the participation of the Parliament in the executive should be expressed and regulated. The course of the evolution of that machinery—the selection by the Crown of its advisers and administrative departmental heads from the chiefs of the parties in the Parliament—was determined by the mere force of circumstance, that is, by the situation in which William III, and again, a generation later, George I, each found himself as the imported ruler of a strange country. The gradual development of the party system of government afforded the key to the solution of the problem of which the 17th century had been so long in labor. For when once the obvious step had been taken of selecting the party chiefs as the heads of the various executive departments, the development of the system of Cabinet government was bound to follow sooner or later. But even so, generations had still to elapse before this new parliamentary executive fully grasped

the control of that last and most highly prized flower of the kingly prerogative, the direction of the foreign policy of the country.

So far as these results depended upon the mere accidents of the Revolution of 1688 and of the Hanoverian Succession they may be regarded as, in a sense, fortuitous. If it is true that England has blundered into an empire, much more true is it that she has blundered into a Constitution.

If the ordinarily accepted view of the constitutional importance of our 17th century history is wide of the mark and distorted, much more truly may this be said of the ordinary view as to the religious history of that period.

The chief outstanding features of that religious history are, firstly, the absolutely unreasoning fear of a Catholic reaction, and, secondly, the temporary exaltation of Puritanism.

These two are by no means synonymous. For whereas the jealous fear of Catholicism was national, pervading the country blindly from end to end, the triumphant emergence of Puritanism was local, partial, temporary. But if the two are not synonymous they have been alike in their fate. With the inscrutable irony of her passionless lips the Muse of History has consigned them both to the region of human futilities. The further we are drifted from the 17th century by the stream of time the more difficult does it become to us to realize the standpoint of that century on the question of the Catholic reaction. We can see now that whatever form that attempted reaction took, whether it be of the theological discussions which waged in the presence of James I as the divines flocked round his chair, or of Laud's unattainable conception of an unifying Catholicity, or again of Charles II's cynical but more statesmanlike conception of Indulgence, or finally of James II's grossly bigoted intrigue, in one and all of these or any other forms the movement was doomed to failure before its birth. The panic, the absolutely unreasoning fear, the blinded and relentless fury which seized the nation again and again throughout the period and which not only accounted largely for the rebellion of 1642 and the revolution of 1688, but also left their malignant trail on two centuries of our later history, fill us to-day with only a sense of disdainful surprise.

As for Puritanism, the second religious phenomenon of the century, the judgment of our own day has been more sympathetic, partly because it has been the fashion since Carlyle's day to speak of it in terms of respect, and partly because the movement has not yet lost its force in English and American life. But be it borne in mind, in the 17th century Puritanism in its day of power did not show itself a constructive force either in the domain of dogma or in the domain of ecclesiasticism. The dogmatic wrangles of the Westminster Assembly—the discussions as to the method of the imputation of Christ's righteousness and what not else—are utterly meaningless to us. And when Puritanism was called upon to solve the problem of the erection of a national church it completely failed. In the mere interests of human tolerance Cromwell, himself a Puritan of the Puritans, was forced to take the problem out of the hands of his co-religionists and thereby to dash to the ground their half-finished and futile

structure. And will anyone contend that either in its persecuted birth or in its day of exaltation, when for a brief span it wielded the wooden sword, or again in its day of adversity when at the Restoration 2,000 of its ministers left the national church to wander in the by-ways of Separatist Dissent, that in any one of these its forms Puritanism was ever a missionary movement or a missionary church in the sense in which 18th century Methodism was a missionary movement? Such contention could not be maintained. The basis of Puritanism was dogmatic and clerical throughout; the fervor of humanity never breathed into it a spark of missionary fire. Its zeal was spent in the dogmatic defense of forms of church government, in the safeguarding of the church membership of each little community. To the nobler issues of life, to the higher conception of toleration, of humanity, or national religion it was, and throughout the succeeding century it remained, cold and dead.

**Bibliography.**—The original authorities for 17th century English history consist of:

1. Parliamentary records: the 'Lords Journals' and 'Commons Journals' which are in print; and much material still in manuscript at the House of Lords, but which is being gradually printed by the Historical Manuscripts Commission. The only full edition of the Acts of Parliament is the 'Statutes of the Realm,' but this collection does not contain the Commonwealth Acts and Ordinances. These latter can only be obtained from the collections of Husband and Scobell, and from the separately printed ordinances.

2. The archives in the Public Record Office: comprising mainly (a) Domestic State Papers calendared up to 1675 and from 1689-93. (b) Foreign State Papers, not calendared at all for the 17th century. (c) Colonial papers, only partially calendared. (d) Certain departmental archives, and Commonwealth Committee archives, only partially calendared as yet. Of the departmental archives the Treasury Records are the only ones at present being calendared; similarly the printing of the 'Register of the Privy Council' has not yet reached the 17th century.

3. Archives not preserved at the Public Record Office, viz.: (a) Collections of manuscripts and individual manuscripts at the British Museum, at the Bodleian (including the Clarendon manuscripts, Carte manuscripts, and Tanner manuscripts), and at Lambeth (including the Commonwealth Church Manuscripts). So far as these sources have been worked at all it has only been by individual effort or by societies such as the Camden. Of the manuscripts printed by the Camden Society, the 'Clarke Papers,' 'Nicholas Papers,' and 'Lauderdale Papers' may be particularly instanced. (b) The archives in the possession of private families are being systematically printed by the Historical Manuscripts Commission. So many of the reports bear on the 17th century that it is almost impossible to particularize, but the 'Buckeuch manuscripts,' 'Portland manuscripts,' 'Ormonde manuscripts,' 'Cowper manuscripts,' 'Rutland manuscripts,' 'Fleming manuscripts,' 'Stuart manuscripts' and 'Kenyon manuscripts' may be specially instanced.

4. Printed collections of state papers, viz.: Winwood, Sydney, Roc, Wentworth, Rush-

worth, Nalson, Thurloe, Milton, Clarendon, Orrery, Macpherson, Hardwicke, Rochester, Carstairs, Kemble and Stuart Papers.

5. Diaries, memoirs, etc., other than those published by the Camden Society and other societies, viz.: Whitlock, Burton, Ludlow, Holles, Fairfax, Hutchinson, Price, Herbert, Reresby, Warwick, Berkley, Evelyn, Pepys, Anchitell, Grey, Luttrell, Ellis Letters.

6. Constructive synthetic works: Rapin and Tindal, Baker, Clarendon's 'History' and 'Life,' Carte's 'Ormond,' Kennett's 'Register' and 'History,' Burnet's 'Own Time,' Andrew Marvell's works, Sir William Temple's works, Boyer, Ralph and Dalrymple.

7. Of tract literature the mass is so great that the portions which have been printed in the 'Cabala,' 'Harleian Miscellany,' 'Somers' Tracts,' 'State Tracts of Charles II,' and 'State Tracts of William III,' are an inconsiderable fragment of the whole.

8. Of modern constructive historical work the only English one worthy of the name is S. R. Gardiner's great work covering the years 1603-54. Carlyle's 'Cromwell' is a constructive work of distorted view; Macaulay's history for the latter part of the century represents a type of historical writing which is deservedly falling into disrepute among professional historians. Ranke's 'History of England,' and Doctor Ono Klopp's work on the fall of the House of Stuart are scientific and exhaustive. For Church History, Shaw's 'History of the Commonwealth Church' is a specialized work covering only the years 1640-60. The various denominations of the Dissenting Churches, as also the Quakers have an abundant historical literature of their own, but, generally speaking, neither the religious history of the century as a whole, nor the intensely important and interesting economic history of the century have as yet received adequate specialized attention, though Doctor Cunningham has covered many aspects and much of the ground of the latter section in his 'Growth of English Industry and Commerce.'

WILLIAM A. SHAW,

*Author of 'History of the English Church Under Civil Wars and Commonwealth'; 'The Knights of England'; etc.*

**6. HISTORY OF THE 18TH CENTURY. Historical Sketch.**—The 17th century had settled two very important questions. It had been finally decided in 1689 that the government was to be carried on in accordance with the will of the House of Commons and that there should be freedom for both religious and political opinion outside Parliament. The questions of taxation without consent of Parliament and of the state control of religion, which had convulsed the 17th century, were no longer all-absorbing, and the 18th century found an outlet for its energies in new directions. It is therefore the century of great economic advance, of commercial wars, of the expansion of trade, of the growth of colonies, culminating toward the end in the transformation of the whole rural and industrial life of the country.

The leading features of the period from 1702 to 1815 are those connected with the rule of the great Whig aristocracy in Parliament, the expansion of England abroad in spite of the opposition of France, the consolidation of the

Britannic state at home and the change of the whole character of the country by the coming of machinery. See INDUSTRIAL REVOLUTION (article 32).

The great constitutional fact of the 18th century is that the era of the responsibility of the monarch for the welfare of the nation had passed away for ever. William III had been called to the throne by Parliament and it was on Parliament that he depended for his support. In 1702 the Crown was vested by an Act of Parliament in the Electress Sophia of Hanover and her Protestant descendants, and the first two Georges happened to be men who were thoroughly German and so left English affairs to the English Parliament. Hence the predominance of the House of Commons became firmly established. It was found convenient that a group of ministers should form a committee to carry on the affairs of the nation. Gradually it became the rule for them to be chosen from the party which had the majority in the House of Commons and to vote under the leadership of one man. The delegation of monarchy to the Prime Minister and the Cabinet was accomplished by the end of the 18th century. See CROWN AND CABINET (article 13).

The Revolution of 1689 had split the country into two great parties—the Whigs and the Tories. The Whigs, who were the active commercial party, were in favor of a Protestant succession and toleration in matters of religion. As they believed in a parliamentary king as opposed to a king by Divine Right they were bound to reduce the power of the monarchy but to support the existing line which they themselves had chosen. The Tories had to choose in 1689 between their religion and their king. If they supported the king they would destroy the Established Church and set up the Roman Catholic Church. Hence they decided against the king and joined the Whigs to get rid of the Stuarts. Then they repented, especially when they found that the Whigs obtained all the emoluments of office and to restore themselves to power they looked to France and the descendants of James II who had French support. Meanwhile they were quite willing to join the Whigs in depriving the Hanoverians of as much power as possible and so we see both parties disposed to lessen the power of the Crown. It was not until the reign of George III that the Tories became reconciled to and supported the king *de facto*. The Whigs were the great war party because they were anti-French; the Tories were the peace party since in France lay their hopes of getting back their own king.

In the reigns of William III and Anne the monarch was still able to hold the balance between the two parties. Under the first two Georges the Crown could only exercise its power by means of great ministers, notably Sir Robert Walpole. George III determined to throw off the yoke of Parliament and was successful in bringing in the Tories under Lord North in 1770, but even so popular and determined a king as George III found it impossible to carry on the government except through Pitt. The power of the Crown was still further weakened during the period of mental incapacity of the monarch and by the incompetence of his immediate successors.

During the 18th century it was gradually found advisable in the interests of the despatch of business that the king should choose his ministers from that party which had a majority in the House of Commons. In 1696 a party ministry had been formed, but the lesson was only slowly learned that the Ministry must depend on the state of parties in the Lower House. In the time of William and Anne composite ministries were the rule. Under George I and George II there was a constant Whig majority in the Commons and a Whig Ministry in power. In 1784, however, George III was successful in keeping Pitt in power notwithstanding an adverse majority in the Lower House. But the king only anticipated the decision of the country, for at the next election a House was returned which supported Pitt, and from that time the Prime Minister and the Cabinet have always been chosen from the predominant party.

Thus monarchy, as it "withered on the throne took root in the cabinet." The parliamentary government of the 18th century was however by no means government by the people. It was government by the great aristocratic families, tempered by deference to public opinion. It was not till the electoral reforms of the 19th century that the democracy became predominant. The great era of English expansion and the command of sea power were attained under an aristocracy and not under a democracy.

The question of English colonial expansion during this period centres round the long struggle with the French. The most profitable line of trade in the world was considered to be that of the Spanish colonies and the adjacent islands, and with these England drove a considerable contraband traffic. On the other side of the world there were the riches of the East and the wealth of the Spice Islands. It seemed probable in 1701 that France, the great commercial rival of England, would inherit the throne of Spain, drive out the English from the Spanish Main and dominate that trade. Hence England's intervention in the War of the Spanish Succession. By a series of brilliant battles won by the Duke of Marlborough between 1704 and 1709 she attained her object, for by the Treaty of Utrecht (1713) England gained Gibraltar, Port Mahon, Nova Scotia, and Newfoundland; while the rights of the Hudson's Bay Company in their vast territory were definitely recognized. England had secured a base from which to operate against the French, and at the same time by the *Assiento* Contract (see GREAT BRITAIN—EIGHTEENTH CENTURY COMMERCE) she won a share in the monopoly of Spain in America and prevented it being closed to her by France. The war left Holland and France financially exhausted. The Dutch trade began to fall behind. France was heaping up financial burdens which were to lead to national bankruptcy. England alone was in a position adequately to maintain a navy and the command of the sea. She thus became the foremost sea power and secured her trade supremacy in one of the most important quarters of the globe. An attempt to interfere with it led to the war with Spain in 1739, which merged into the war of the Austrian Succession ending in 1748.

In another direction, however, that trade supremacy was being threatened. In India a French and an English East India Company each had trading factories or settlements, the English posts being Bombay, Madras and Calcutta. They were not subject to the English government, but were under the company, and England had no governmental responsibility whatever in the matter.

In India there prevailed, about the middle of the 18th century, a wild anarchy due to the break-up of the Mogul Empire in 1707, and military adventurers were beginning to make themselves supreme in various parts. The French governor of Pondicherry, Dupleix, a man of great military genius, began to perceive that it was quite possible for Europeans to gain predominance in the general scramble; and by supporting various native rulers and organizing native troops on the European model he soon made himself one of the chief powers in India. If the English were not to be ousted altogether they too had to organize. Clive copied the French policy so successfully that English influence became predominant, and the future of India fell into the hands of the English. The French settlements were restored, but they were no longer military establishments, and France was reduced to relative unimportance. In 1784 the English government became responsible for the administration of India, while the East India company continued to have a monopoly of the trade.

The dominance of England on the Spanish Main and in India was followed by the ousting of the French in North America. The French had established themselves at the mouth of the Mississippi, and claimed all the country lying between the Saint Lawrence and the Mississippi west of the Allegheny mountains. The Seven Years' War in Europe gave England a chance to fight the matter out, and at the Peace of Paris in 1763 England gained Canada, all the land west of the Mississippi, four West Indian islands, and a promise not to fortify the French settlements in India; and from Spain she obtained Florida.

Thus by 1763 England was mistress of the whole American continent, and the dominant European power in India, while the trade and commerce of the East and West were in her supreme control.

England then felt that as she had done so much to protect the young colonies from being swallowed up by the French they ought to pay part of the cost of their own defence in future. She accordingly proceeded to increase the tax on colonial imports, and to prevent evasion instituted a stricter enforcement of the Navigation Acts. She also imposed a stamp tax. The colonists, who were no longer afraid of the French, wished to be free to work out their own destiny in their own way. Hence the revolt of the Americans in 1776, ending in the recognition of their independence in 1783. France and Spain had joined in against England, and, although the result was the loss of the American colonies, England was given a welcome opportunity of sweeping French commerce off the seas, and of finally destroying the Dutch shipping. England emerged in 1783 more decidedly than ever the great trading power of the world.

The loss of the 13 American colonies raised the question of the disposal of convicts, since they could no longer be sent to the United States. Hence the Government turned its attention to Australia which had been explored by Captain Cook between 1768 and 1770. The island had been the resort of a few traders, but much preliminary work needed doing before it could become attractive to settlers, and the result was that convicts were despatched in 1788 to Botany Bay to do the preliminary work of road-making. Then, as the wool famine in England became more and more acute, the destiny of the colony shaped itself along the line of sheep-farming.

After the Revolutionary and Napoleonic wars England made a further addition to her possessions, gaining the Cape, from which she has been able to build up a South African empire. Ceylon, British Guiana, Trinidad, Heligoland and Mauritius, were minor acquisitions made in 1815; and the foundations of her Far Eastern Empire were laid in the cession of Penang in 1786, which gave England a footing in the Straits Settlements.

The United Kingdom emerged from the Napoleonic wars with a huge national debt, but with an enormously increased trade; with 50 years start of Europe in manufacturing, and with the unrivalled possession of the sea-power which had been her definite goal from the time of Elizabeth onwards.

This great expansion could not have been accomplished if England had not been blessed with internal peace. Had Scotland declined in 1702 to accept a German line of kings and decided to pursue, as a large faction wished, her own independent way with her own king, England would have been in constant danger of invasion from the north on behalf of the Stuarts, or of intervention from an unfriendly kingdom. The Scots having been shut out of the best trading parts of the world, tried to establish themselves on the Isthmus of Darien, but met with disastrous failure, a failure which they laid at the door of England. In England this undertaking aroused a great fear of ultimate Scottish success in this particular line of commerce. It seemed better to absorb the Scots than have them as rivals. England was also anxious to secure the assent of the Scottish to the House of Brunswick as the ruler of the two kingdoms and she accordingly offered them a share in the whole of the English trade if they would acquiesce to a union. The Scottish who were most anxious to get a part of the English trade monopoly, assented. The union of the two kingdoms was thus accomplished, the Scottish sending members to the English Parliament and giving up their own, but preserving freedom in matters of religion. Scotland thus merged her individuality in that of England and accepted English trade privileges as a setoff against a German king.

Ireland was less fortunate. There was not the same necessity for conciliating her. The Irish Parliament was dependent on England, and when the Irish tried to set up their own king—James II—they suffered crushing defeat at the battle of the Boyne. The English were not afraid of Ireland as they were afraid of Scotland. Ireland was a conquered country and as such must take the conditions imposed.

She was, moreover, Roman Catholic, and England could not absorb her in the same way as she had Scotland. Hence Ireland was deliberately prevented from becoming prosperous by a series of laws which shut her out of the colonial trade and destroyed her woollen manufactures and cattle trade. At the same time a series of penal laws against the Roman Catholics were instituted which gave the power into the hands of the Protestant minority.

Both trade disabilities and religious oppression were successful in preventing Ireland from being a danger to England till the revolt of the American colonies gave Ireland the opportunity of claiming an independent Parliament, which demand was conceded in 1782. It became a question then of settling the trade relations between the two kingdoms and of the Irish contribution toward Imperial defence. No satisfactory solution had been reached when civil war broke out between the Irish Protestants and Roman Catholics. England felt that the Protestant interests in Ireland needed protection. Moreover the Irish finances became very involved, and it seemed as if Ireland was on the verge of national bankruptcy. The English manufacturers wished to secure the Irish market whereas the Irish Parliament showed a disposition to impose protective duties even as against England. It seemed best to the statesmen of the time to solve all these various problems by a complete union of the two countries. Scotland had come into the English system when the era of Whig protection was beginning, and she prospered exceedingly. It was hoped that Ireland would do the same. But Ireland came in just when England was engaged in a life and death struggle with France. She felt all the effects of the dislocation of trade and of the great financial strain. Later on her nascent industries were exposed to the overwhelming competition of the English machine-made products, and her provision and corn trade were vitally and injuriously affected by the English free-trade reforms, while she had no compensation as England had in her manufacturing prosperity.

Vast indeed are the changes recorded in the history of the 18th century. At the beginning of that century Scotland, jealous, sullen and separate, was a constant menace to the expansion of England; at the end she had become united with her southern neighbor in a political union cemented by identical trade interests. Ireland also had been united in a common Parliament, but cannot be said to have been absorbed in the same way. William III, like his predecessor on the English throne, acted as his own prime minister. Long before the death of George III the monarch had given place to one of his powerful ministers as the real head of the executive government. In the early years of the century party ties sat lightly upon ministers; at the end of it a cabinet which was not homogeneous would have been an anomaly. At the beginning of the century France seemed destined to inherit the riches of the Spanish Main and the East Indies. The end of the century saw French commerce swept from the seas in East and West and India under British rule. England's colonial empire of the first part of the 18th century was English speaking and not extensive. By the end

of the century her principal English speaking possessions had cut themselves adrift; but had been replaced by a scattered empire of many races; and the foundations had been laid of that wide empire, the superstructure of which is not even yet complete.

**7. THE FRENCH WARS OF THE 18TH CENTURY.** Hostility to France is one of the chief characteristics of British policy in the 18th century. It may be ascribed to various motives, religious, dynastic, commercial, and to the purely political motive of maintaining the balance of power. At the beginning of the century the first and last of these motives were uppermost. The first collision between the two powers arose out of the efforts of Louis XIV of France to gain complete control of the Spanish dominions, then comprising Southern Italy, Milan and the greater part of the Flemish Netherlands, as well as a large portion of the New World. It is worth noting that the French threat to the Netherlands touched British policy in a vital spot. From the time of Richard I and Edward III, down to those of William III, Wellington and even to the war of 1914, British rulers have very rarely hesitated to defend the Netherlands against a great power which sought to annex them and make them a base of action against the British Isles. Louis XIV, however, would hear of no compromise such as was suggested by William III of England, the Dutch Republic, and the House of Hapsburg, but, in the lack of a direct descendant of the Spanish Bourbons, claimed the crown of Spain for his grandson (subsequently Philip V of Spain), a great-grandson of Philip IV of Spain. He did more. He captured the Dutch troops who shared in the defence of the "barrier fortresses" of the Netherlands; and in 1701, on the death of James II, formerly king of England, but now an exile in France, he promptly recognized his son as king of England. The affront rekindled

in England the dormant zeal for the Protestant succession; the House of Commons had to cease from its factious opposition to "Dutch William"; and the king prepared vigorously to curb the designs of Louis XIV for a universal monarchy. He sent Marlborough with 10,000 troops to protect the Dutch Netherlands, and even the death of William, and the accession of Queen Anne, who leaned to the Tory or peace party, could not avert war. William's last diplomatic work, the grand alliance (1701), with Austria and the Dutch Republic held good, and the elector of Brandenburg-Prussia joined the league on the understanding that he should receive the royal title in Prussia, as Frederick I.

The world was soon startled by the display of genius such as had never been seen in the campaigns of William III. Clogged, as he was, by the dilatory procedure of the Dutch, Marlborough effected little of note in the years 1702-03; but in 1704, when the Hapsburg forces were sore beset in South Germany by the Franco-Bavarian army, he resolved to march up the Rhine valley to the help of the Imperialists in Swabia. Skillfully misleading the French as to his intentions, he surprised the hostile forces near Douauwörth on the Upper Danube and clinched this success by a brilliant triumph at Blenheim, 13 Aug. 1704. A daring attack delivered across marshy ground against the French centre cut their array in twain, and drove thousands of fugitives into the Danube. Of an army 60,000 strong in the morning only some 20,000 survived uncaptured at night. Marlborough was able to effect little in the year 1705, when the interest centred on the brilliant though unsubstantial triumphs won by Lord Peterborough in Spain. In the campaign of 1706, Marlborough struck a decisive blow at the French army under Villeroi near Ramillies (23 May); the capture of Brussels, Ghent and Antwerp resulted from this victory, which also had the effect of lessening the pressure on the Imperialist leader, Prince Eugene, in Northern Italy. In 1707 the tide seemed to turn in favor of the French and Spaniards; the latter on 25 April gained a complete victory at Almanza, regained most of the eastern and northeastern provinces of Spain for the Bourbon cause. In July 1708, however, Marlborough utterly overthrew the French at Oudenard on the river Scheldt, and followed up his success by bringing the great fortress of Lille to surrender (December). These events laid the Spanish Netherlands at the feet of the allies and opened up a way into France.

Nevertheless, Louis XIV rejected their terms, and, making an appeal to his people, continued the war with fresh vigor, which was seen in his troops during the stubborn and murderous conflict at Malplaquet, 11 Sept. 1709. The skill of Marlborough and Eugene gained the day, but it was a barren triumph. The war dragged on for three years more; but the growing desire for peace in England, and the partisan intrigues which resulted in the recall and disgrace of Marlborough, brought it to a conclusion in the Peace of Utrecht, 13 March 1713. Great Britain secured Gibraltar and Minorca, Nova Scotia, parts of Newfoundland, districts around Hudson's Bay and the French part of Saint Christopher's. Spain, by what was called the *Asiento* Treaty, granted to her

the sole right of importing slaves into the Spanish colonies of America. The Dutch retained their hold on most of the "barrier fortresses" of the Netherlands, and that territory along with Naples and the Milanese, went to the Hapsburg emperor, Charles VI. The traditional friendship of Great Britain and Austria warranted the hope that the Belgic Netherlands would, in Austria's hands, be safe from French aggression; and this was soon assured by Barrier Treaties. Philip V retained Spain and the Indies, Great Britain rather shabbily deserting the Catalans whom she had instigated to rise against the Bourbon ruler. The treaty was not one to be proud of; but it restored the balance of power and rendered impossible any further attack by Louis XIV on Great Britain and Holland. The phantom of an almost universal monarchy ceased to trouble the world until it reappeared a century later in the person of Napoleon. Further, this war of the Spanish Succession so far exhausted France, Spain and Holland, as to leave Great Britain mistress of the seas.

The accession of the House of Hanover in 1714 tended to embroil Great Britain in the political struggles of Central Europe. As electors of Hanover, the Georges were among the chief dignitaries of that venerable but decaying fabric, the Holy Roman Empire, and involved England in the disputes caused by the rivalry of the Houses of Hapsburg and Hohenzollern. The War of the Austrian Succession, which opened in 1740 with the seizure of Silesia by Frederick the Great of Prussia, aroused the sympathy of Britons with the young ruler, Maria Theresa of Austria; and when France joined the ranks of her would-be despoilers, Great Britain intervened in order to maintain her power as a counterpoise to that of France. George II, leading his troops in person, gained a victory over the French at Dettingen on the River Main, 27 June 1743; but two years later (11 May 1745) the British arms sustained a serious reverse at Fontenoy, near Tournay, where the genius of the *Maréchal de Saxe* prevailed over the stubborn valor of the British infantry. The Guards' Brigade retrieved the honor of the Union Jack by a splendid advance, which, if supported by cavalry, might have turned the fortunes of the day. As it was the defeat at Fontenoy and the romantic campaign of "Bonnie Prince Charlie," grandson of James II, in Scotland, clogged British efforts on the continent with results disastrous to her allies. At sea, however, and in the colonies, the Union Jack was nearly everywhere successful, the capture of Louisbourg (21 June 1745), leading to the reduction of Cape Breton Island and the opening of the Saint Lawrence to British attacks. But at Laffeld near Maestricht, Saxe heavily defeated Cumberland's army of British, Austrians and Dutch (2 July 1747). In September the French took the fortress of Bergen-op-Zoom and seemed likely to overrun the Dutch Netherlands. Their fleets, however, were badly beaten by Warren and Hawke off Finisterre and Belleisle (May—October 1747). Both powers at length became weary of the war, and by the Peace of Aix-la-Chapelle (October 1748), agreed to restore their conquests—a clause deeply resented by British seamen and merchants, while the surrender of Cape Breton

Island to the French enraged the men of New England. France guaranteed the Belgic Netherlands to Austria, and agreed to dismantle the fortifications of Dunkirk. The balance of power was thus restored, both in European and Colonial affairs.

In 1756 Austria's grievance against Prussia concerning the Province of Silesia lit afresh the flames of war in Europe, Canada and India. Already France and Great Britain were practically at war in the valley of the Ohio and in the Carnatic, owing to the masterful policy there pushed on by Montcalm and Duplex. Therefore, when France, reversing her traditional policy, allied herself with Austria for the partition of Prussia, Frederick the Great naturally became the ally of the Court of London (January 1756). At first matters went ill with the two Protestant States; Frederick could not at first make head against the coalition (joined by Saxony and Russia); and Great Britain lost Minorca, largely through Admiral Byng, who was executed. Matters did not mend until in June 1757, George II recalled to office the one inspiring personality in English public life, William Pitt. Acting on the principle summed up in his famous phrase — "I will win America in Germany" — he lavished subsidies on Frederick the Great. Slowly but surely the tide turned; Frederick's brilliant victory at Rossbach (5 Nov. 1757), over the French and their allies paralyzed the French government; and the results of favoritism and incompetence became apparent. The French navy was speedily worsted in several fights; Louisburg surrendered to Boscawen on 26 July 1758, and Prince Edward Island also fell to the Union Jack. Late in November British and Colonial troops captured Fort Duquesne on the Ohio and it was renamed Pittsburgh. In India success was chequered with failure. By the victory of Plassey (23 June 1757), Clive had subdued Bengal; but after the arrival of French reinforcements, Count Lally, the successor of Duplex, captured Fort Saint David and nearly took Madras. Gradually the pressure of sea power told in favor of Great Britain, and the long struggle for the possession of the Carnatic was decided by Eyre Coote's brilliant victory of Wandewash (22 Jan. 1760), which led up to the capture of the French stronghold, Pondicherry, a year later.

Meanwhile, though Frederick the Great was very hard pressed, his western flank was guarded by a mixed British-Hanoverian-German army ably commanded by the Duke of Brunswick. Great Britain, meanwhile harried the coasts of France, completed her conquests of French colonies as well as those of Spain, when she drew the sword for France. Thus the British race reaped the full reward foreseen by Pitt. That statesman had the gift of choosing the right men; and his sagacity discerned in a young officer, Wolfe, the conqueror of Canada. The manner in which Wolfe captured the Heights of Abraham (13 Sept. 1759) is too well known to need description. Quebec and ultimately the whole of Canada were the fruits of a victory, which itself resulted from the ability of the mistress of the seas to attack when, where, and in what force she chose.

After the accession of George III to the throne, and of the Bute Ministry to power, the Anglo-Prussian alliance lapsed; but the war

with France continued. By the (third) Bourbon Family Compact, Spain made common cause with her neighbor; but the British navy overbore all opposition at sea; and in February 1763, the Peace of Paris put an end to what had now become merely a maritime and colonial war. France ceded Canada, Cape Breton Island, Prince Edward Island, together with Grenada, Saint Vincent, Dominica and Tobago, as well as Senegal in Africa. Spain ceded Florida, but received from France as indemnity the great district of Louisiana. Great Britain restored to France several of her conquests in the East and West Indies, also to Spain parts of Cuba. Save that France handed back Minorca to England, the changes in Europe very slightly affected the Island Power; but she emerged, from what had been at first merely a continental war, the greatest of the world powers.

The completeness of her triumph brought its Nemesis. The American War of Independence furnished France with the longed-for opportunity for revenge. She declared war formally against England in 1778 after her volunteers had long been helping the colonists. Soon the maritime policy of her rival leagued together the northern powers in the League of the Armed Neutrals. The war, however, having been described in the article UNITED STATES — AMERICAN REVOLUTION, it is unnecessary to comment on it here, or to advert to the influence which sea power exerted on the decisive event, the surrender of Cornwallis at Yorktown (19 Oct. 1781). By the Treaty of Versailles (3 Sept. 1783), France recovered Senegal, several West India islands, acquired extended fishery rights on "the French Shore" of Newfoundland, and gained Tobago. Of all the wars between England and France that of 1778-83 was most completely colonial in character and in its results. Never before had France dealt her rival so serious a blow; but it recoiled on herself; for the ideas of liberty and civic equality which her soldiers learned in the land of Washington were now carried back to the mother country with results fatal to the Bourbon monarchy.

The Revolutionary War (1793-1802), stands apart from the previous struggles in that it was at the outset largely, though by no means wholly, a war of opinion. It turned mainly on the question whether the French Republic could with impunity set aside the rights of the Dutch republic over the navigation of the lower part of the River Scheldt, which Great Britain by the treaty of 1788 had undertaken to guarantee. The French in their resolve to make Antwerp a great port, persisted in ignoring that treaty; and matters were in a very strained state between England and France, when the execution of Louis XVI at Paris, 21 Jan. 1793, made all hope of compromise impossible. The French on 1 Feb. 1793, declared war against Great Britain and Holland. These powers therefore joined the first coalition (Austria, Prussia, "the Empire," Sardinia and Naples); but the jealousy of Austria and Prussia, the incompetency of the allied leaders and the enthusiasm and energy of the French soon drove the allies out of their territory. A British force was defeated at Hondschoote near Dunkirk, and had to retire toward Ostend (September 1793). To months later Admiral Hood's bluejackets

and their Spanish and Neapolitan allies were driven from redoubts near Toulon; mainly owing to the skilful dispositions of Bonaparte, and had to abandon that seaport. The campaigns in Flanders languished owing to the paucity of the British forces, which had to leave the Low Countries early in 1795. In that year Prussia came to terms with France.

The coalition was shattered by the astonishing triumphs of Bonaparte in Italy (1796-97), which compelled Sardinia, Naples and finally Austria, to make peace. Holland and Spain, having become allies of the French, the war became solely maritime and colonial. Mutinies at Spithead and the Nore (April-June 1797), threatened to complete England's ruin; but the gloom of that year was brightened by the victory won by Jervis and Nelson over the Spaniards off Cape Saint Vincent (Feb. 14), by Duncan's triumph over the Dutch fleet at Camperdown (Oct. 11). Pitt's overtures for peace to the French government in August-September, came to naught. The scene of war then shifted to the Mediterranean where Bonaparte's great expedition captured Malta and Egypt; with a view to the eventual conquest of India. His schemes were thwarted by Nelson's brilliant victory near the mouth of the Nile (1 Aug. 1798); and the pressure of sea power received further illustration by a severe check administered to Bonaparte at Acre by Sir Sidney Smith's squadron. Britain put forth great efforts in India, where Wellesley's capture of Seringapatam early in 1799 led to the overthrow and death of that ambitious ruler, Tipposahib; and after Bonaparte's secret departure from Egypt, a British expedition under Abercrombie and Hutchinson finally compelled the French army which he left behind to surrender (27 Aug. 1801). Malta had fallen to the British fleet in 1800.

Meanwhile, the aggressive conduct of the French government in Europe had enabled Pitt to form a second coalition which swept the French forces from Germany and Italy. An Anglo-Russian force in Holland, however, fared badly and finally had to leave the country (Oct. 1799). At the close of the year Russia left the coalition. In 1800 the allies lost ground rapidly. Bonaparte, virtually master of France after the *coup d'état* of Brumaire (Nov. 1799), overthrew the Austrians at Marengo (14 June 1800); Moreau completed their disasters at Hohenlinden in December, and the Court of Vienna came to terms with France early in 1801. Bonaparte with rare skill now prepared to turn the tables against England by effecting an alliance with Russia, and reviving the League of the Armed Neutrals. Again his aims were thwarted by Nelson, whose victory at Copenhagen (2 April 1801), paralyzed the league. The assassination of the Tzar Paul, and the accession of Alexander I, facilitated a compromise on maritime affairs; and the losses of the French in Egypt and Malta predisposed them to peace with England. Ultimately the belligerents came to terms in the Treaty of Amiens (27 March 1802), whereby England agreed to restore all her colonial conquests to France, Spain and Holland (including the Cape of Good Hope to the last-named), except Trinidad and Ceylon, while the Spaniards and Dutch, respectively, ceded to her. Malta was to be restored to the Knights of Saint John (on

conditions which proved to be unworkable), while Egypt reverted to Turkey.

In the Anglo-French wars of the 18th century the importance of the commercial and colonial motives is increasingly apparent. The first two struggles originated in dynastic affairs relating to the then dominant principle of the balance of power; but the increasing solidity of the European states and the growth of commerce under conditions which were almost prohibitive to foreigners, turned the gaze of statesmen more and more to the new lands beyond the seas. The result may be estimated by reading over the causes and results of the wars here briefly set forth. Europe, after settling down on the foundations laid in 1713 and 1748, occupied less attention from statesmen at London and Paris. The French Revolution brought matters back sharply to the old field of debate between the two powers—the Netherlands; but when the weakness of the coalition and the genius of Bonaparte made France paramount on the Continent, the struggle quickly became one for supremacy in the Levant, and the East and West Indies. The vigor with which he played the rôles of Cæsar and Alexander the Great would have enabled him to wrest from England her world empire had he not been confronted by Nelson. Even so, the struggle between the secular rivals ended in 1802 on terms on the whole favorable to France; and it was soon clear that the first consul viewed the Peace of Amiens as an opportunity of strengthening the position of France in Europe, as well as her fleet and her colonies, in order to resume the struggle for empire under conditions far more favorable than Louis XIV had ever known.

**Bibliography.**—For a short account of the wars of the 18th century, consult the histories of England by Dr. J. F. Bright, J. R. Green and Dr. S. R. Gardiner; also 'The Balance of Power—1715-89,' by A. Hassall. The fullest accounts are to be found in the 'History of England in the Eighteenth Century,' by W. E. H. Lecky (6 vols.), and the 'History of England Since the Peace of Utrecht,' by Earl Stanhope (7 vols.). Fortescue, 'History of the British Army'; Mahan, Capt. A. T., 'Influence of Sea Power Upon History,' and Seeley, Sir J. R., 'The Expansion of England,' very suggestively treat certain parts of the subject. **8. HISTORY OF THE 19TH CENTURY.** The history of the British people in the 19th century is dominated by three facts or tendencies, themselves the outcome of its past history and its physical environment: (1) a portentous development of the national resources, resulting from the industrial revolution, improved agriculture, and the colonial expansion of the 18th and 19th centuries; (2) consequent collisions or friction with other growing nations, especially Imperial France and Imperial Germany; (3) a revolution of feeling in favor of peace, attention to domestic reforms and commercial expansion by pacific methods. These three phases of national life are closely related; the first is connected with the life of the 18th century of whose achievements—scientific and mechanical, military and maritime—it was the continuation. The second or warlike movement originated in the effort of an expansive but insular people to seek over-seas the material resources wanting at home, and prompted the efforts associated with the names of Nelson and Wellington, Dalhousie and Dufferin, John A. Macdonald, Parkes, Roberts, Kitchener and Cecil Rhodes. The third tendency, prudential or philanthropic in its origin, has as spokesmen Fox, Bentham, Shaftesbury, Peel, Cobden and Gladstone. The following brief sketch is not intended to be a commentary on these statements; but they may be regarded as sign-posts helping the historical traveler along paths which, though far from easy, yet frequently run on parallel or converging lines.

The first 15 years of the century witnessed a phenomenal development both of the material resources of Great Britain and of the strife with France—both of them well marked features of the previous years. In the years 1801-15 the inventions of Watt, Cartwright, Trevithick and George Stevenson led to an enormous expansion of the factory system and means of locomotion. But in those same years the material resources of the land were consumed in a struggle for national existence. The year 1803, which saw the renewal of war between England and France after the brief truce of Amiens, is marked by the exhibition of Trevithick's first locomotive. In the year of Waterloo (1815) Stevenson proved his Killingworth locomotive to be a practical success. The skill and expansive energies of man, which went to feed the flames of the great war, were also in large measure its cause. The rise of Napoleon to absolute power in France and his masterful interventions in neighboring states (especially in the Netherlands, where

British rulers have never suffered a hostile military power to take root), his prohibition of British imports, and his endeavor to found a Colonial Empire at the expense of that of Britain brought about the mightiest of all Anglo-French wars, that of 1803-14. It is worthy of notice that the influence of the autocrat brought back the struggle from the sphere of opinion to that of material and colonial interests characteristic of the 18th century. The war had three well marked stages. Toward the close of 1805 Trafalgar left England mistress of the seas, while Austerlitz made Napoleon master of the Continent. In the next two years he strove to mass all the continental states against her in a commercial war styled the Continental System. Its pressure seemed to be bringing England to the verge of bankruptcy; but in 1808 the revolt of Spain threw open the Iberian Peninsula and the Spanish and Portuguese colonies in America to British trade. The defection of Russia in 1812 ruined Napoleon's prospects, and the subsequent campaigns (1813-15) assured the triumph of England and the overthrow of the great emperor. Her gains were colonial. Mauritius, Tobago and Saint Lucia were yielded up by France. For the Cape of Good Hope, Dutch Guiana and Curaçoa, conquered during the war, the victor paid to Holland a sum of £6,000,000. Malta, Heligoland and a protectorate over the Ionian Isles were the sole acquisitions in Europe from a war which added more than £600,000,000 to the national debt. The strain had been terrible and nothing but the new strength gained from the factory system, improved agriculture, and the mastery of the seas, could have brought the country through. Pitt, "the pilot who weathered the storm," died in 1806; but his heirs, the Tories, held on to power until 1830.

The burden of debt hung like a millstone round the neck of the nation for the next generation. In place of an income tax (then viewed as essentially a war tax) imposts were in and after 1815 placed on all possible articles, including foreign corn. Demonstrations and riots were the result; repressive measures, such as the Six Acts of 1819, were of no avail; and the unpopularity of George IV (1820-30) brought the monarchy itself into danger. Yet this time of malaise and political reaction was not fruitless. Canning, as Foreign Secretary, did much to thwart the reactionary policy of the monarchs who had framed the Holy Alliance, and his encouragement of the Liberals of Spain and of the Greek patriots led to notable results in the lives of those peoples, as also in the attitude of the United States toward Europe. (See MOSKOE DOCTRINE). The abolition of civil disabilities affecting Nonconformists in 1828, and the emancipation of Roman Catholics in 1829 with the reluctant assent of the Wellington ministry, showed that the days of privilege were over.

The event of the next year ushered in a new era. The death of George IV brought to the throne his far more popular brother William IV; and the general election, held during the excitement caused by the deposition of the elder House of Bourbon in the revolution of July 1830, in Paris, led to the return of a majority favorable to electoral reform at Westminster. After a long and acrid struggle the

Reform Bill of 1832 was passed. It enfranchised in all parliamentary boroughs householders paying a rental of £10, also copyholders in the counties. It disfranchised a number of very small boroughs and transferred their voting power to the new manufacturing towns and districts. Thus the influence exerted by the second French Revolution on English democracy was far more favorable than that of the first revolution. The anarchy and the wars resulting from that great upheaval put back the cause of parliamentary reform in England for 50 years. The seeming success of the second revolution (July 1830) now added vigor to the English movement which had meanwhile been strengthened by the silent yet potent changes in the distribution of population and modes of life resulting from the industrial revolution. That change, ever working with accelerated energy, necessitated the transference of power from the old rural England to the new manufacturing England; and thanks to the accession of William IV in 1830, and of Victoria in 1837, this momentous revolution took place peacefully. While breaking the power of the old Tory party, it rooted the monarchy more firmly in the hearts of the people.

The ensuing decades were times of great strain and stress, but they were met firmly and on the whole successfully. The wider sympathies and business aptitudes of the new Parliament showed themselves in the Factory Act (1833) of Lord Ashley—afterward Lord Shaftesbury; in the emancipation of slaves in British colonies, for which a sum of £20,000,000 was voted as compensation to the owners; and in the Poor Law Amendment Act of 1834 which cut at the roots of the growing evil of pauperism. Nevertheless the working classes of the great towns were in a state sometimes bordering on sedition, partly owing to resentment against the Whigs for refusing to extend the franchise laid down in 1832, and still more owing to the harsh administration of the new Poor Law. Trade depression, low wages, high taxes and dear corn swelled the volume of discontent. It took form in two well defined movements, Chartism and the Anti-Corn Law League, which, beginning in the year 1837, ran a parallel and competitive course, and ended in the year 1848, the former in failure, the latter amidst almost complete success. This difference in the fortunes of the two movements may be ascribed to the following causes. The Chartists, (q.v.) sought to cure evils, which sprang mainly from economic causes, by purely political means. The six points of their Charter were (1) annual Parliaments, (2) manhood suffrage, (3) equal electoral districts, (4) payment of members of Parliament, (5) abolition of the property qualification for members of Parliament and (6) vote by ballot. This program (a revival of the advanced Whig program of 1780) aimed at benefiting the working classes through Parliament. The Free Traders sought to benefit them by altering taxation so as to let in free, or nearly free, the necessities and small comforts of life. Further, Chartism suffered from the unwise means used by the physical force wing of the party whose leaders fell out with one another. The Free Traders on the other hand had excellent leaders, Cobden and Bright, whose arguments finally brought over to their side large numbers of the

workingmen and the Prime Minister himself, Sir Robert Peel.

This able man had pieced together the Conservative party from the more malleable of the fragments of the old Tory faction; and, largely owing to the failures of the Whigs in finance, he came back to power after the general election of 1841 with a strong and apparently homogeneous following. His openness of mind soon brought him into collision with very many of his followers. He became a Free Trader, while they remained Protectionists. He soon came to see that the long series of deficits could be ended only by recourse to direct taxation; and in his budgets of 1842 and 1845 he abolished or greatly lessened duties on large numbers of articles, making good the temporary loss by an Income Tax of 7d in the £. He also lessened the sliding scale duties on foreign corn. The result was seen in improved trade and in a decline of pauperism and misery. In 1845-46 the Irish famine brought him to sacrifice the corn duties—a measure which earned him unmeasured abuse from Disraeli and Lord George Bentinck and the gratitude of the poor throughout the whole kingdom. Thus the working classes gained their chief aims through the efforts of the Free Traders and the legislation of Peel. Consequently when the continental revolutions of the spring of 1848 induced the physical force Chartists to copy the methods which had been successful in Paris, Berlin and Vienna, the result was a ludicrous fiasco, which brought Chartism as an organized movement to an end. The spirit that had animated its best leaders, namely a burning love of freedom and a passionate desire for the moral and mental uplifting of the working classes, lived on in those Radical parsons, F. D. Maurice and Charles Kingsley, in the second founders of the Co-operative and Friendly Society movements, and in the later Radicals, who by wise methods soon gained four of the six points of the Charter. The same yearnings after ideals far other than those realisable by mere party strifes and sordid commercialism permeated much of the best work of Carlyle and of his young disciple Ruskin, and throbbed in the youthful poems of Tennyson, Browning and Swinburne.

The decade of the forties, marked by political discontent, but dignified by ideal aspirations in all spheres—the disruption in the church of Scotland, the Anglican movement in the church of England and the pre-Raphaelite movement in art, belong to that momentous epoch—faded away into a period marked by expanding trade and mental quiescence. Gold discoveries, railways, steamships, these were the chief pre-occupation of mankind; and under their subtle alchemy democracy and idealism of all kinds vanished for a time, both in England and on the Continent. As often happens in these expansive epochs (which recur after the introspective, critical and reforming epochs), a collision occurred with another growing power, Russia. The Crimean War resulted largely from the efforts of that stern autocrat, the Tsar Nicholas I, to browbeat the Turks, whose political power was then thought to be essential to the security of the overland route to India. The hope entertained by the British nation that the Sultan would reform his government and grant religious liberty soon proved to be vain; and England came to see that she had cham-

pioned a moribund cause. She gained nothing by the war; and its first reverses did much to promote the ferment in native circles in India which led to the terrible mutiny of 1857.

Affairs in Europe soon engrossed public attention. In the Crimean War, England had had the alliance of Napoleon III of France and of Victor Emmanuel II of the Kingdom of Sardinia. Her relations with the French emperor speedily cooled; and complications in the years 1858-59 brought the two people so near to a conflict as to lead to the revival of the volunteer movement. Far different was the attitude of the nation toward the Italian movement for liberation and unity. The masterly statescraft of the Piedmontese statesman, Cavour, and the heroic deeds of Garibaldi in southern Italy in 1860 aroused the keenest interest. The diplomatic help given by British statesmen, Palmerston and Lord John Russell, then laid the basis of that friendship which has since subsisted between Great Britain and the United Kingdom of Italy.

Amidst these excitements Cobden did good service by promoting a commercial treaty between England and France on free trade lines, (it held good for the years 1860-70) and Gladstone, the Chancellor of the Exchequer, by his budgets of the early sixties succeeded in further cheapening the necessities of life. But no advance was made on purely political lines, firstly because the influence of Palmerston, the Prime Minister, barred the way, and secondly because popular interest centred largely in the wars of that troubled period—the American Civil War (which at one time portended a strife between the two kindred peoples), the Danish War of 1864, and the Austro-Prussian War of 1866. The end of this last struggle brought a lull which favored the hopes of reformers. The death of Palmerston on 18 Oct. 1865, had removed another barrier; for, since the death of the Prince Consort at the close of 1861, his influence in the political world had been almost without bounds. Other causes now helped to turn attention to home affairs. The cattle plague and the sharp financial crisis of the year 1865, the Fenian outrages of the next year, and the general state of malaise throughout the United Kingdom brought men once more to that critical or introspective mood which is favorable to political reform. A singular concatenation of events brought into office in June 1866 a Conservative Ministry headed by Lord Derby and Mr. Disraeli—into office but not into power, for they were face to face with a hostile majority, irritated by the recent rejection of a moderate Reform Bill championed by Lord John Russell and Mr. Gladstone. The result was a series of acrobatic performances whereby Disraeli, erstwhile the denouncer of the inconsistencies of Peel, foisted on his party in 1867 a measure far more democratic than that of the previous year. Household suffrage was thenceforth the law of the land for all parliamentary boroughs. After a short time of uneasy balancing, the Conservative Ministry was overthrown by the general election of November 1868.

Democracy now came in as with a flood. The Gladstone Ministry (December 1868—February 1874), carried legislative activity to lengths never before seen in England. The disestablishment of the Irish church (1869); the

Irish Land Act and the Elementary Education Act (1870); the abolition of the system of purchase in the army, and the appointment of the Local Government Board (1871); the Ballot Act and Licensing Act (1872); the Supreme Court of Judicature Act (1873)—these were the chief measures passed in this period, which witnessed also the settlement of the Russian claims respecting the Black Sea and the Alabama claims urged by the United States. In these matters, as in the sphere of foreign policy generally, the Ministry was deemed to have sacrificed British interests needlessly.

The outcome of this feeling, and of the alarm felt by many classes at home whose interests were injured or threatened, was seen in the general election of February 1874, which marked a sharp reaction in favor of Imperialism and a spirited foreign policy. Disraeli (created earl of Beaconsfield in August 1876) came back to power at a time when the Eastern Question entered on an acute phase. The years 1875-78 were overshadowed by the atrocities committed by the Turks on their Christian fellow subjects, and by the Russo-Turkish War. Sharp differences of feeling were caused by Lord Beaconsfield's treatment of these events, as also by his acquisition of Cyprus (June 1878). Depression of trade at home and the outbreak of wars in Zululand and Afghanistan in 1879 made the Ministry more and more unpopular, with the result that the election of March 1880 brought back Gladstone to power with a large majority. His second ministry (April 1880—June 1885), coincided with a time of great ferment in Ireland and of unrest abroad, with which he coped manfully but not very successfully. Irish affairs were not settled by his drastic Irish Land Act of 1881; his very large concessions to the Boers of the Transvaal in 1881 and 1884 aroused a most bitter feeling among loyalists in South Africa and sowed the seeds of future trouble. British intervention in Egypt (1882) was successful, but had as an unfortunate corollary the despatch of General Gordon to Khartum; and the dealings of the Ministry with Russia respecting the Afghan frontier at Pajndj, as also with Germany respecting various colonial questions on the coasts of Africa and New Guinea, were marked neither by foresight nor firmness. In the midst of these disturbances Gladstone, with characteristic tenacity, pushed through the Reform Bill of 1884 and the Redistribution Bill of 1885 in face of prolonged opposition from the Lords. The former measure extended household suffrage to the counties; the latter divided the whole country into electoral districts with some approach to numerical equality.

The general election of 1885 was of singular interest as marshaling the revived forces of Democracy and Imperialism. The former won, thanks to the votes of the newly enfranchised agricultural laborers; but the triumphant Liberal party was split in twain by Gladstone's Irish Home Rule Bill and Land Bill (April 1886). The general election of July 1886 reversed the decision arrived at 18 months earlier, and Lord Salisbury took office with a Unionist Ministry which sought—as he phrased it—to govern Ireland "honestly, consistently and resolutely." It also passed the local Government Bill (1888), the Irish Land Purchase Bill (1891) and strengthened the army and navy, and adopted

a firmer tone on foreign affairs. In 1892 the swing of the pendulum brought Gladstone back to power—for the fourth time,—but in 1894 he retired and Lord Rosebery undertook to reconstitute the ministry. Even his versatility failed to solve the difficulties arising from disunion in the cabinet and in the Liberal party, and from the tension in public opinion caused by massacres of Christians in Armenia and Crete. He resigned in 1895, and the ensuing elections brought back the Unionists to office with a majority larger than had been known since 1832. Lord Salisbury's new ministry, which included some Liberal Unionists, had to grapple with a succession of difficulties—the Venezuelan affair, complicated by President Cleveland's message, Doctor Jameson's raid in South Africa, complicated by Kaiser Wilhelm's famous telegram, oppression and anarchy in Crete and many parts of the Turkish empire, and the campaign against the Dervishes on the Upper Nile.

To these matters we cannot advert. We can point out here only two chief facts in the political history of the century—the gradual effacement of the old party lines, and the curious periodicity in the political life of Great Britain. To dwell on the latter of these, it is clear that the main tendency has been toward democracy and industrial development by peaceful means—a tendency dominant in the periods 1816-1848, 1866-1874, 1880-1886, 1892-1895. The intervening years were marked either by the quiescence which comes naturally after great constructive efforts, or by the striving after national security and the consolidation of the empire which results inevitably from the insular position and expansive force of a virile people. The century closed, as it began, amidst what may be termed the imperial impulse, of which industrialism has been the unconscious but all powerful feeder. The era of great production, coinciding as it does with one of militarism and protection on the Continent of Europe, imposes on England the need of looking and living beyond the seas to an extent unimaginable to the men of Nelson's generation. In this dualism of her interests, democratic and imperial, lies the great problem of her political life—a problem never to be solved but ever keeping her faculties tense and keen. A word must be said on the development of Socialism in Great Britain. It took a new start in 1881 with the foundation of the "Democratic Federation," which in 1883 became openly Socialistic. Mr. Henry George's book, "Progress and Poverty" (1881) excited some attention, as did the author's lectures during a visit to England in 1884. But neither his theories on the land nor the more systematic Socialism of Karl Marx had a permanent effect on British workmen, who, certainly up to 1900, preferred to act through Trade Unions and Co-operative Societies for their own betterment. The Profit Sharing Movement also brought them into closer touch and sympathy with many employers, who adopted that system.

**Bibliography.**—We can name here only a few of the chief works dealing with the outstanding events of British political life and with the men who made history in the 19th century. Besides the text books on the English history of the period written by Doctor Bright and Doctor Gardiner, there are 'History of England—1800-1815' and 'History of the Thirty Years'

Peace—1816-1846' by Harriet Martineau; 'History of England from 1815' (6 vols.) by Sir Spencer Walpole (continued up to 1900); 'A History of Our Own Times' by Justin McCarthy (continued up to 1900, 4 vols.); 'Social England' (vols. V and VI) edited by Doctor Trail; 'The Political History of England,' Vol. XI (1801-1837) by Hon. G. C. Broderick and J. K. Fotheringham; Vol. XII (1837-1901) by S. J. Low. Also the following biographies: 'Pitt' by Lord Rosebery (1 vol.) also by J. H. Rose (2 vols.); 'Life of Nelson' by Captain Mahan (2 vols.); 'Life of Wellington' by Sir Herbert Maxwell (2 vols.); 'George Canning' by H. W. V. Temperley; 'Peel' by J. R. Thursfield; 'Life of Palmerston' (1846-65) (2 vols.) by Hon. Evelyn Ashley; 'Life of Lord John Russell' by Spencer Walpole (2 vols.); 'Life of Cobden' and 'Life of Gladstone' (3 vols.) by Lord Morley; 'Life of Lord Granville' by Lord E. Fitzmaurice (2 vols.); 'Life of Lord Randolph Churchill' by Winston Churchill (2 vols.); 'Life of Disraeli' by Monypenny and Buckle; H. Paul, 'History of Modern England' (to 1895) (5 vols.); 'Reign of Queen Victoria' by T. H. Ward; 'John Bright,' by G. M. Trevelyan (2 vols.); 'Sir Stafford Northcote,' by Andrew Lang (2 vols.); 'The Cambridge Modern History' (Vols. X-XII).

J. HOLLAND ROSE,  
*Author of 'The Development of the European Nations, 1870-1914.'*

**9. THE POLITICAL PARTIES—TO 1906.** Party government begins, in primitive society, with the struggle for power, the nature of which is determined in each case by local and tribal conditions, and by the influence of men who are or aspire to be leaders. At a later stage, when abstract logic is applied to questions of policy, the parties begin to argue from principles; they profess themselves friends of the people, friends of the better class, and so forth. The principles invoked are not scientific propositions; they are rather forms of language, such as are received with favor in a mixed assembly; the party-leader uses them so as to combine opinions and interests, to draw together a working majority. Each party borrows freely what seems to be effective and popular in the program of its opponents. Moderate men of all parties think very much alike; they are kept apart by the personal struggle for power.

These general truths are well illustrated by the contest between Whigs and Tories in the 17th century. The Whigs were an aristocratic party, relying on the nobles, the landed gentry, and the city of London. Their principle was, the supremacy of the law: they were determined that the courts which administer the law and the high court of Parliament which makes the law, should be freed from the arbitrary interference of the king. Moderate Tories did not undervalue the law; they argued that by law the king was entitled to obedience, and that the king then reigning had done nothing to forfeit his claim. The Whigs carried their point in 1688, by bringing in a foreign king, William of Orange, a capable, magnanimous man, not less firmly attached to his royal prerogative than the Stuart kings had been. With the advent of the House of Hanover in 1714, Whig principles came once more to the front; for the first George and his son were Germans; they needed

an interpreter between the king and the people; and the statesman who could manage the House of Commons was not, like Strafford or Clarendon, dependent on the support of his royal master. George III on the other hand was a patriotic Englishman; he thought himself strong enough to choose his own ministers and to throw off the yoke of the Whig nobles. If he had possessed the administrative talent of Frederick the Great he might have made himself the head of the government and set himself above the parties. But King George was neither a great statesman nor a great soldier; he relied too much on the smaller arts of political management; and in the middle of his long reign he came under the influence of a minister whose commanding character excluded the king from the personal conduct of national business. It is to Pitt that we owe the outline of our modern constitution. At Windsor he was the servant of the Crown, arguing, often in vain, against the obstinate purpose of his master. In the cabinet he was himself master; he chose his colleagues, and dismissed them when they opposed his policy. In the House of Commons, which was still an aristocratic body, his ascendancy was never seriously disputed, and he filled the House of Lords with peers of his own creation. So it was that Pitt, by birth and training a Whig, became the founder of the new Tory party.

Pitt's opinions were those of an official Liberal. He wished to reform the electoral system, to remove religious disabilities, to relax the rigor of laws which prevented the expansion of trade. But the fates had imposed upon him the task of steering the ship of State through a period of wars and revolutions: the work of reform was postponed to the necessities of foreign and domestic policy. When the great minister died, his unfinished schemes fell into the hands of men with whom postponement was a settled habit. During the long Tory administration of Lord Liverpool there was, in principle, but little difference between the parties. The middle classes were impatient, and some of them joined the workingmen in declaring that neither of the aristocratic parties could be trusted. These independent men called themselves radical reformers, and they sympathized with the aspirations of democracy in America, in Ireland, and on the continent of Europe.

The Reform Act of 1832 was a Whig compromise; it failed to satisfy the Radicals, but it gave them a foothold which they never lost. It was indeed the first attempt to apply abstract principles to the English constitution, and it started a momentous process of change. Tradition was dethroned, and the old party names had become unpopular. The Whigs began to call themselves Liberals, a name which some of them declined, because it suggested humanitarian tendencies with which they were not in sympathy. Macaulay, for example, would not call himself a Liberal, because, as he said, he was in favor of "war, church establishments, and hanging." The Tories in their turn became Conservatives; they accepted the results of 1832, but deprecated any further change in fundamental institutions. The Radicals of that day were middle-class men, disciples of Bentham; they stood for cheap government, freedom of contract and individualism. Socialism made its appeal to the unenfranchised laborers, but as yet

without much visible success. The Factory Acts, for example, were carried by Tory humanitarians, against the opposition of Radical manufacturers. Free trade, when it came, was the work of a Conservative administration; the Liberals approved; the older Whigs, like Lord Melbourne, thought that Peel had betrayed the landed interest. Lord Derby, a hereditary Whig, was carried over to the conservative Tories by his fears for the Church and his dislike of free trade.

The conflicting tendencies of the half-century after the first Reform Act are summed up in the careers of two men who were to take a leading part in the transition to democracy. Disraeli entered life as a Radical; he was always hostile to the Whig oligarchy. His sympathies were with the Tories; his father, a quiet scholar, had taught him to take the side of the Stuart kings, and to regard the old nobility as the true leaders of the people. If Peel had given him office, he might have become an orthodox Conservative; but the leaders of that party had no place for an able Jew, who lacked the public school and university stamp. Disraeli took his revenge by attacking Peel and his free-trade policy; his merciless wit gave him the ascendancy, even with men who still distrusted him; he gained the confidence of Lord Derby, and in alliance with him began the construction of what was really a new party, the party of Tory democracy. In 1867 the new Tories took their famous "leap in the dark" by establishing household suffrage in the boroughs. The immediate result was a crushing Liberal victory; but in 1874 the forces of Tory democracy were strong enough to place their leaders in power. Six years later the pendulum swung back and Mr. Gladstone was once more supreme.

Lord Beaconsfield died in the moment of defeat, but his genius presides over the party which he formed, and profoundly affects the mind of the nation. He never concealed his belief that the conduct of public affairs, especially foreign affairs, must be left to sovereigns and statesmen. At the same time he was always in sympathy with the aspirations of the workingmen. He was the only public man of his generation who perceived that Benthamite Liberalism was certain, sooner or later, to become unpopular, and he prepared the way for that modified socialism which is now the accepted creed of both parties. And again he perceived that Englishmen, without distinction of class, are conscious of their position as an imperial power, and determined to maintain it. Disraeli himself, in his earlier days, had taken the narrower views of England's responsibility to India and the colonies; his later speeches are full of the sentiment of empire. Englishmen are all (to some extent) socialists now; and are all (in one sense or another) imperialists.

Mr. Gladstone began his career as the rising hope of Oxford Toryism. He was honestly afraid of Radicalism; he distrusted the Whigs; the mission of the Tory party was to "maintain truth" by supporting the Church of England. At the age of 30 he published his book on 'The State in its Relations with the Church'—a noble vindication of the Church as a spiritual society, pledged to maintain her conflict with sin and selfishness, a society to which the support of the state is not essential,

but may, under proper conditions, be useful. It was in the interest of the state that Gladstone argued for the establishment and endowment of the Church. His argument was coldly received; the qualified approval of Peel, the scornful criticism of Macaulay, began to work a change in Gladstone's political mind. No criticism touched his ideal; but in the present age of the world the ideal was, perhaps, unattainable. If Whigs and Conservatives were equally unable to rise to his conception of the Church, if the price of establishment was to be subordination to the state, what then? The Church, to preserve her freedom and purity, might withdraw from the alliance, surrendering those of her privileges which might be found inconsistent with abstract political justice. Within a few years after the publication of his book, Mr. Gladstone was discussing the possible advantages of disestablishment.

Sir Robert Peel was not pleased to see an able young party man so preoccupied with ecclesiastical questions. He drew Gladstone into his ministry, placed him at the Board of Trade, and worked him very hard. In the transition to free trade, master and pupil moved steadily together. While Peel was leader there could be no doubt as to Gladstone's party connection; when that guiding influence was removed he was carried about by various kinds of doctrine. Though more than half a Liberal, he was still afraid of Radicalism. He approved of Lord Palmerston's passive resistance to the extension of the franchise, but this was his only link of sympathy with the coming leader of the Liberal party. There was much agreement between Gladstone and Lord Derby; both were Oxford Tories and devoted Churchmen; but by this time Lord Derby was identified with Disraeli, and the Peelites would not serve under the man who had planted so many barbed arrows in the sensitive spirit of their chief. After long hesitation, Mr. Gladstone threw in his lot with the Liberals. In June 1859 he supported Lord Derby in a critical division; 10 days later he took office under Lord Palmerston.

As a member of a Liberal government, Gladstone stood committed to parliamentary reform. His Whig colleagues discovered with alarm that this late convert was not merely a reformer; he was a democrat. He declared, from the Treasury bench, that the laboring class had a moral right to come within the pale of the constitution. There was now only one link between the Liberal champion and the Toryism of his youth; he was still member for the University of Oxford. That link was severed when the University rejected him in 1865. Mr. Gladstone appealed to the people of Lancashire, and entered on the first of those oratorical campaigns which were to change the face of English politics.

The franchise question was settled, for a time, by the Tories in 1867, and the popular vote of 1868 was a personal vote for Mr. Gladstone. With a wide and varied electorate, and many interests competing for notice, the people are easily persuaded to accept the supremacy of one man, who, like General Jackson, "acts always for the good of the country." Under such conditions the leader of opposition, if he knows his business, has his rival at a disadvantage. It is the men in power who have to make terms with foreign governments and to protect the

national purse; however well they do, it is always easy to show that they might have done better. Mr. Disraeli made good use of his opportunities, and in 1873 the tide of Liberal success was ebbing rapidly. Mr. Gladstone was alarmed, and he would fain have made his defeat on the Irish University question an excuse for bringing his opponents into office. Disraeli saw the snare and avoided it, and the wisdom of his tactics was justified by the Conservative victory of 1874. As a leader of opposition, Mr. Gladstone disregarded what were then supposed to be the conventions of party life. He retired from responsible leadership; returned to the field just at the moment when his action was most likely to embarrass his successors; and finally presented himself to the country as a candidate for power. In the election of 1880 his success was complete, and the death of Lord Beaconsfield left him without a personal rival. But once more the tide ebbed as rapidly as it had risen. In a few years it became evident that the Liberal party was hopelessly divided on three issues of cardinal importance—disestablishment of the Church, Home Rule for Ireland and the scheme of modified socialism advocated by Mr. Chamberlain. Old badges and cries were out of date. Mr. Parnell was forming an Irish party, so severely disciplined that no member of it could break away or disobey orders. For a few eventful months there was also a fourth party, a small band of Tories who obstructed their own leaders, addressed themselves in a democratic spirit to the conservative rank and file and made themselves so strong that in 1885 Lord Salisbury was compelled to take them into partnership.

At the general election of 1885 Mr. Gladstone endeavored to keep his party undivided by postponing all troublesome questions. He did not declare against Home Rule, but he pointed out the danger of allowing Mr. Parnell to hold the balance of power. This was his reason for asking the country to give the Liberals a majority large enough to make them independent of the Irish vote. In the event, parties were so distributed that the Conservatives and Parnellites, if combined, would be equal or superior in number to the Liberals. Mr. Gladstone accepted Home Rule. It would be quite unfair to represent his conversion as a bid for power and nothing more. The argument for Home Rule was a strong one, and both the great parties were studying it in a practical spirit. But with all his vast experience of affairs, Mr. Gladstone was subject to illusions. He believed that the Irish demand, as presented by him to the electors of England and Scotland, would prove to be irresistible. In this belief he cashiered those of his supporters who refused to follow, and when the House of Commons rejected his proposals, he hurried on a "penal dissolution" and went again to the country. The "classes," he said, were against him; he appealed to the "masses." The masses responded by placing the Unionists in power.

In the Parliament of 1886-92 the Liberal Unionists occupied a position somewhat analogous to that of the Peelites in 1850. They were stronger in ability than either of the great parties; they sat on the Liberal benches and co-operated steadily with the Conservatives. Lord Salisbury in office did himself no discredit; but he had to make himself responsible

for unpopular measures. The Crimes Act of 1887 was in itself a moderate measure, but it was a deep disappointment to many who had begun to hope that Ireland might be governed without repressive legislation. A good many independent Liberals fell quietly into line with their old party; the swing of the pendulum was felt. In 1892 Mr. Gladstone became Prime Minister for the fourth time, and entered buoyantly on the task of framing a second scheme of Home Rule. When the scheme appeared his party saw plainly that it was not an improvement on the bill of 1886. Discipline was maintained; the bill of 1893 was carried through the House of Commons and it was darkly intimated that the House of Lords must accept it or take the consequences. The Lords rejected the bill by a very large majority. Mr. Gladstone was at the end of his physical resources; he was followed by Lord Rosebery, who, however, was not the man to succeed where the old leader had failed. The election of 1895 vindicated the shrewd forecast of the Lords and restored Lord Salisbury to office.

From this time forth the Liberal Unionists were identified with the Conservatives; but in consenting to share the spoils of victory they did not withdraw the Liberal or Radical opinions which they had professed. Mr. Chamberlain, for example, did not withdraw his objection to church establishments; but he could not, of course, give effect to his opinion so long as he retained his connection with the Unionist party, which is pledged, as a party, to the defense of two established Churches. On that question no difficulty arose, but, at the height of its success, the party was broken up by the tariff controversy initiated by Mr. Chamberlain's attack on "one-sided free trade" in 1903. As conceived by its author, the plan of modified protection had two aspects, socialist and imperialist. It aimed at securing constant employment for the British workman, and at consolidating home interests with those of the colonies by means of preferential tariffs. The plan was advocated in a series of speeches which could hardly be excelled for clearness and force; but the electors were not convinced. In January 1906 the fiscal question held the field; and free trade carried all before it. The Unionist party was left in a helpless minority; its leaders found comfort in recalling the precedents of 1841, 1874 and 1886—the years in which the Conservative party recovered its ground after an apparently crushing defeat.

The new government was supported by the Whig Liberals and by the Radicals, who combine Manchester (free trade) doctrines with modified socialism as best they can. In former Parliaments, Labor members were few, and voted with the Liberals. They still prefer Liberals to Unionists, but their support is given in return for concessions which put a strain on the Liberal members of the Cabinet. On Irish questions, the Nationalists voted with government, on the understanding that Mr. Gladstone's policy would be revived at an early date; but where Catholic schools are concerned that vote is hostile to the educational policy which commends itself to most Liberals. The Unionist opposition was seriously embarrassed by differences of opinion in regard to free trade. Amid these currents and cross-currents the leader had to steer the best course he could.

We still defer to the notion that there are two great parties in the state; but the House of Commons has in fact become a collection of groups, like the Reichstag or the Chamber of Deputies.

THOMAS RALEIGH,  
*Author of 'Elementary Politics,' etc.; Member  
of Council of India, 1909-13.*

#### 10. THE POLITICAL PARTIES 1906-18.

With the accession of the Campbell-Bannerman (q.v.) administration in January 1906, the Liberty Party returned to power after nearly 20 years' political exile. Excepting for two short spells of one year and two years the Conservatives, joined by the Liberal Unionists, had been in power since 1886. The so-called "khaki election" of 1900 had kept the Unionists in office to carry on the South African War, to which most of the Radicals and Laborites were bitterly opposed. The late Lord Salisbury had resigned in 1902 and was succeeded by his nephew, Mr. Arthur James Balfour, who carried on the government till December, 1905, when he in turn resigned with his cabinet. Rent asunder over the fiscal or "tariff reform" question, the Unionist party was said to be suffering from "senile decay" and the country was only too willing "to give the other side a chance." Sir Henry Campbell-Bannerman came in with an overwhelming majority. The Liberals captured 379 seats out of the total of 670; the Unionists only had 157. In addition, the government had at their disposal the votes of 51 labor members and 83 Irish Nationalists. Though a pronounced Home Ruler, the new Premier did not touch the thorny problem of Irish separation during his tenure of office. The two previous Liberal administrations had been shattered on that rock. He introduced several highly contentious measures which were promptly killed by the House of Lords. Yet his brief administration (he died in 1908) was marked by some daring and really useful acts of legislation; he settled a very old controversy of many years' standing by passing the Deceased Wife's Sister Act in the teeth of fierce clerical opposition; he introduced a court of criminal appeal—a much-needed measure; created a public trustee; a system of probation for juvenile and first offenders; a protective patents act, and a merchant shipping act. The Liberals undoubtedly possessed a set of brilliant and enthusiastic leaders in Mr. Asquith, Mr. David Lloyd George, Mr. Winston Churchill, Mr. (now Viscount) Haldane, Mr. (now Lord) Morley and Mr. Birrell. Beyond offering destructive criticism the feeble opposition could exert a very limited influence over what they called the "socialistic orgy" of the Radicals, a generic title applied to the heterogeneous party then in power. Mr. Asquith succeeded to the premiership shortly before the death of Sir Henry Campbell-Bannerman. Opinion differed little about Mr. Asquith: a cool, clever, strong and determined man possessing little imagination and no illusions. His predecessor had held the party and its allies together with amiable tact; Mr. Asquith dominated by sheer force of a commanding personality. He was ably seconded by the Chancellor of the Exchequer, Mr. Lloyd George, the fiery little Welsh lawyer and orator who, but a few years before, had been the "best hated man" in the United

Kingdom. In 1900 the latter had had to adopt the disguise of a policeman to escape from the threatened violence of an infuriated mob in Birmingham. Also a convinced Home Ruler, Mr. Asquith realized the futility of introducing any measure of Home Rule for Ireland while the Lords possessed the power of the veto. He at once opened a campaign to deprive the Lords of that power. Needless to say, he had the hearty support of the whole Liberal, Labor and Nationalist members, and the most strenuous opposition of the Conservatives and Liberal Unionists. The two latter parties, now fully united, forced a general election in January 1910, when the government's big majority melted away; from 513 it fell to 124 all told. The Irish Nationalists and the labor parties now had the government in their power; nor did they fail to press their demands. The bill of the Parliament Act (see article II PARLIAMENT) was introduced in April 1910. Numerous conferences on the subject between representatives of both houses failed to produce an agreement, and Mr. Asquith again appealed to the electorate in December of the same year. The result of the election was that his majority rose by only two; the same number of Liberals were returned as Unionists, namely, 272, and the government was now entirely dependent for its existence upon the Irish and labor votes. The Parliament Act Bill was reintroduced in February 1911 and passed by the Lords, and the road to Home Rule lay open. As the "Osborne judgment," upheld by the highest court, had deprived the trade unions of the right to pay the salaries of labor members in Parliament, every private member of the House of Commons was voted a salary of \$2,000 per annum. The Unionists vehemently opposed the measure, and a number of them have never accepted the payment. By this means were the Liberals, Laborites and Irish Nationalists welded into one party pledged to mutual support. Profiting by the example of their opponents, those Liberals who seceded from their party over the Home Rule splits of 1886 and 1893, and retained the title of "Liberal Unionists" though acting always in accord with the conservatives, have since gone over entirely to the latter and amalgamated with them. Hence the two parties were simply styled "Unionists," i.e., pledged to maintain the union between Great Britain and Ireland. Home Rule was definitely passed in 1914, but its operation was postponed pending the duration of the war. See IRELAND.

The outbreak of the European War took the British public and politicians wholly by surprise. Entirely absorbed in their internal—and internecine—affairs and party quarrels, they had failed to observe the war clouds gathering on the horizon. Only a few days before the storm broke the king had told the warring factions summoned to Buckingham Palace that the "cry of civil war" was "on the lips of the most responsible and sober-minded of my people." No sooner, however, than the European situation assumed a serious aspect, the Unionist opposition displayed a magnanimous sentiment of patriotism by declaring their whole-hearted support of the government in the face of possible perils from without, an attitude entirely contrary to that adopted by the Liberals over the South African war in 1899, when the Unionists were in power.

Party strife and criticism disappeared as by magic in August 1914; the Premier's motions for a vote of credit for £100,000,000 for war purposes and for the immediate addition of 500,000 men to the army were carried in the House of Commons on 6 Aug. 1914 without a dissentient voice. With equal promptness and unanimity both Houses of Parliament passed through all their stages a series of emergency acts of Parliament, the most important of which was the Defence of the Realm Act. The life of a Parliament having been reduced from seven years to five years by the Act of 1911, a general election was consequently due in 1915, but was postponed owing to the war. As a substitute a Coalition Ministry was formed in May 1915 and nine Unionists were admitted to the Cabinet of 22. The number was raised to 10 in August 1916 by the appointment of a Unionist (Mr. H. E. Duke) as Secretary of State for Ireland in succession to Mr. Birrell, a Liberal. The Coalition Ministry collapsed unexpectedly on 6 Dec. 1916. Mr. Asquith resigned and was succeeded by Mr. Lloyd George, who formed a special cabinet of five members for a more vigorous prosecution of the war. The Cabinet was composed of two Liberals and three Conservatives (Unionists). In November 1917 the War Cabinet was reconstituted by the addition of two members, one being the Boer general, Jan C. Smuts, of South Africa.

It may not be out of place here to draw a comparison between the two historic political parties of Great Britain. The Liberals or "Whigs," as they were formerly called, have always been strong on domestic affairs and social legislation. While they were generally weak in the management of foreign affairs, they possessed a remarkable faculty for setting the people by the ears and promoting class antagonism by raising inflammable issues. Measures such as church disestablishment, education bills, licensing, socialistic taxation, etc., generally formed the main planks in their platform. Idealistic and frequently impractical, they were opposed, on principle, to the maintenance of "bloated armaments" and sought by all means to keep expenditure on the navy and army as low as possible. The Conservatives or "Tories," on the other hand, invariably pursued a strong—if sometimes mistaken—foreign policy and believed in the efficiency of an overwhelmingly strong navy. In legislation they generally left the people, as well as established systems, customs and laws as much as possible alone. Since about 1908 there has grown up among the British people an increasing discontent with regard to the party system. Many public men and journals have condemned it as a "farce," a "make-believe" and a "hollow sham," and a general opinion was entertained that the end of the European War would undoubtedly herald some revolutionary changes in British politics.

HENRI F. KLEIN,

*Editorial Staff of The Americana.*

**11. PARLIAMENT.** The British Parliament has its roots deep in the past. It has legislated continuously for a period of more than 600 years, a record unapproached in the history of the world. It has been developed by successive stages from the Great Council of the Norman and Angevin kings. Much of

its ceremonial dates from Plantagenet times. The foundations of this procedure are imbedded in Elizabethan journals. It holds its sittings in a royal palace, which, though for the most part modern in its structure, is venerable in its associations. The new palace yard, through which members of the House of Commons hurry to their daily duties, is the yard of the new palace which William Rufus built, and which is still represented by Westminster Hall. There is scarcely a feature of Parliament which can be adequately described without long historical explanations. The present form of Parliament, as divided into two Houses of legislature, dates from the middle of the 14th century.

Parliament consists of the King, the House of Lords, and the House of Commons, or, as described in the enacting formula of acts of Parliament, the King's most excellent Majesty, the Lords Spiritual and Temporal, and the Commons. These are not as is often, but erroneously, supposed, the three estates of the realm. The clergy, who once counted as a separate estate from the Lords and Commons, have long ceased to do so. The two archbishops (Canterbury and York) and 24 bishops sit, as Lords Spiritual, in the House of Lords. The inferior clergy are for purposes of representation, merged in the laity, and represented in the Commons. An image of the full Parliament, as it existed in Plantagenet times, may still be seen when the king in person formally opens Parliament at the beginning of a session. The king sits on his throne, attended by his great officers of state. The benches of the House of Lords are occupied by the Lords Spiritual and Temporal, and by the peeresses. The judges, summoned as attendants, sit on their woollacks in the middle. The Commons, as beseechers their humbler station, find such room as they can, in or about the bar, with their speaker at their head.

The king, acting on the advice of his ministers, summons, prorogues and dissolves Parliament. He communicates with the two Houses by speech from the throne, commission, message and otherwise. He gives his assent to bills by commission. But he does not take part in, or attend, the deliberations of either House. Since Charles I attempted to arrest the five members no king or queen has been seen inside the House of Commons. Charles II sought amusement in listening to debates of the House of Lords, but his example has not been followed.

The House of Lords consisted in March 1918 of 692 members, including three princes of the Blood Royal—the Prince of Wales, the Duke of Connaught and the Duke of Albany; 2 archbishops, 21 dukes, 29 marquesses, 128 earls, 57 viscounts, 24 bishops, 384 barons, 16 Scottish and 28 Irish representative peers. There are, besides, 19 peeresses of the United Kingdom and 4 Scottish peeresses in their own right and 19 Scottish and 57 Irish peers who are not members of the House of Lords. Representatives of the Scottish and Irish peerage are elected by their peers, Scottish peers for each Parliament, Irish peers for life. But many of the peers of Scotland and Ireland are also peers of the United Kingdom and sit as such. Of the barons a few hold life peerages, as being, or having been, Lords of appeal; the other Lords Temporal hold hereditary peerages.

The House of Commons consists of 670 members, 461 for England, 34 for Wales, 72 for Scotland and 103 for Ireland. Single-member constituencies are the general rule, but in a few cases one constituency returns two members. Every male householder who has resided in his constituency for a year, and has paid or compounded for his rates, is entitled to be registered, and, when registered, to vote as a parliamentary elector for that constituency. This is the most general franchise, but there are others, including the occupation of lodgings rented at £10 a year, and the ownership or occupation of land or buildings of a certain value. Eight universities return nine members elected by their graduates. [Under the provisions of the Representation of the People Act (6 Feb. 1918), to take effect at the first subsequent general election, 31 new boroughs are to be created and 44 old ones extinguished. The number of members will be increased by 37, making a total of 707, provided there is no withdrawal or diminution of the Irish representatives in the interval. The basis of representation is at the rate of one member for every 70,000 of the population in Great Britain and one for every 43,000 in Ireland. The residential qualification for voters is reduced to six months. The register will receive 8,000,000 new voters, of whom 6,000,000 are women, voting for the first time in parliamentary elections. It is estimated that the new register will contain 16,000,000 voters, or one in every three of the population.] Subject to disqualifications arising from peerage, holding of office, bankruptcy, and conviction of treason or felony, every British subject who is of full age is eligible as a member of the House of Commons. A peer of the United Kingdom or of Scotland is not eligible, but a peer of Ireland is eligible for any but an Irish seat. For instance Lord Palmerston was an Irish peer. Where a member of the House of Commons is described as a lord, he is either an Irish peer, or, more frequently, a commoner holding a courtesy title as son of a peer. In the latter case the baptismal name is used, e.g., Lord Hugh Cecil—a son of the Marquess of Salisbury. Members of the permanent civil service, and most judges, are ineligible. All clergymen of the Church of England, ministers of the Church of Scotland, and Roman Catholic clergymen are disqualified.

The evidence of election is the return sent to the Crown office by the returning officer at the election. If the validity of an election is disputed, the question is tried and decided by election judges appointed by, and from among members of the High Court. A member must, before sitting or voting as such, except in the election of speaker, take the oath of allegiance, or make an affirmation to the same effect.

The chief alterations in the electoral law which took place in the 19th century were the Reform Act of 1832 which abolished pocket boroughs and enfranchised the middle classes; the Reform Act of 1867 which, by establishing household suffrage and introducing the lodger franchise in boroughs enfranchised the urban workingman; the Ballot Act, 1872, which introduced secret voting; the Reform Act of 1884, which enfranchised the rural laborer by extending household franchise to the counties; and the Redistribution of Seats Act, 1885, which

made single member constituencies the general rule, and raised the number of seats to 670. As stated above, 37 seats are added by the Act of 1918.

The two Houses hold their sittings in the Palace of Westminster, which is appropriated to their use and to the use of the offices connected with them. The chambers in which they sit are so placed that, if the intervening doors are open, the King's throne at the south end of the House of Lords is visible from the speaker's chair at the north end of the House of Commons. The House of Commons does not occupy the site of the old Saint Stephen's chapel, which was burnt down in 1834, but is constructed on the same general plan, and does not provide sitting accommodation, in the body of the House, for more than about 300 out of the 670 members. For discomfort of crowding there is some compensation in case of hearing.

The accident that the House of Commons sits in a narrow room, with benches facing each other, and not, like most Continental legislatures, in a semi-circular space, with seats arranged like those of a theatre, makes for the two party system, and against groups shading into each other.

The duration of a Parliament was limited by the Septennial Act of George the First's reign to seven years, but its existence was always terminated by dissolution before the expiration of that period. The Parliament Act of 1911 reduced the maximum duration to five years. This measure was introduced by the Liberal government in April 1910. The royal proclamation which dissolves one Parliament always summons another.

There are, or may be, several sessions of the same Parliament. A session is terminated by prorogation, which is an act of the Crown, done on the advice of Ministers. The business of each session begins with a King's speech, which announces its program, and ends with another King's speech, which reviews its proceedings. Each House has the power of adjourning its sitting from time to time. Thus it adjourns from day to day, and always adjourns for a short recess at Easter and Whitsuntide. The two Houses usually meet in February and sit till some time in August, but sometimes hold a late autumn sitting after an autumn recess. The time of meeting is practically fixed by the financial year, which ends on 31 March. Estimates for the ensuing financial year cannot well be got ready before February, and there is certain financial business which must be got through before the end of March.

Each House has its own staff. The Lord Chancellor is Speaker of the House of Lords, and is assisted by a salaried Lord Chairman of Committees. The House has a permanent clerical staff with the Clerk of the Parliament at its head. The Gentleman-Usher of the Black Rod, who has a Yeoman-Usher to assist him, summons the Commons when their attendance is required in the House of Lords, and performs certain other functions mostly ceremonial.

The Speaker of the House of Commons is elected by the House from among its own members for each Parliament. He is the representative and spokesman of the House in its collective capacity (whence his name); he pre-

sides at meetings of the House; and he declares and interprets its law. Though necessarily a party man representing a constituency, he is independent of party, and his tenure of office is not affected by a change of ministry. His powers are more extensive than those of the Speaker of the House of Lords. He has an official residence, besides his salary (\$25,000). He is assisted by a chairman and deputy-chairman of Ways and Means, who take the chair at meetings of a committee of the whole House (there are temporary chairmen also) and who can take the speaker's place as deputy speaker during his temporary absence. These are the only members of the House who receive salaries as officials of the House.

The clerk of the House of Commons is the head of its clerical staff. The sergeant-at-arms sees to the maintenance of order within the precincts and to the execution of the orders of the House, and, as housekeeper, looks after its domestic staff and arrangements.

The law of Parliament consists of the rights, usages, practice and regulations of each House. It may be classified, from a Benthamite point of view, as a substantive law of rights and privileges, and an adjective law of procedure; or, again, as an unwritten customary law to be gathered from precedents and decisions, and an enacted law to be found in orders of the Houses. The substantive law would include the rules which govern the rights of each House, or of the individual members of each House, in their relations to each other, to the Crown, to the executive and judicial authorities of the country, and to individuals and bodies outside Parliament.

The privileges which are formally claimed by the House of Commons through its speaker at the beginning of each Parliament, bulked large in the 17th century controversies between the King and Parliament, and were much insisted on by the Commons of the 18th century, but in the 20th century have retired into the background. The cases in which a member of Parliament, as such, can claim any exceptional privilege or immunity are now few and rare.

The House of Lords is not only a branch of the legislature but the ultimate Court of Appeal from the ordinary courts of the United Kingdom. (Appeals from the colonies and dependencies and ecclesiastical and certain other appeals lie to the Judicial Committee of the Privy Council). It performs its judicial functions exclusively through those of its members who hold or have held high judicial offices. It holds its judicial sittings in the morning, and can sit judicially when the legislature is not sitting. For legislative and general business, its sittings begin at 4.15 in the afternoon and, as a rule, are not of long duration. The cases in which they extend over the dinner hour are exceptional. It does not sit on Wednesday or Saturday.

The House of Commons, when in session, sits from 2.45 to 11 on Monday, Tuesday, Wednesday and Thursday, and from 12 to 5 on Friday. It begins with uncontentioned private bills and other formal business. Questions to Ministers (which are not put on Fridays), occupy or may occupy the time till 3.45. As soon as questions have been disposed of, the public business of the day begins. Opposed business is not taken after 11, unless it belongs to a

special "exempted" class, or unless the eleven o'clock rule is suspended.

The business of the House of Commons is three-fold, legislative, financial, critical. It makes laws with the concurrence of the House of Lords and of the Crown. It imposes taxes and appropriates revenue. By means of questions and discussions, it criticizes and controls the action of the executive.

While a project of law is before either of the two Houses it is called a bill. When it has received the royal assent it is called an act. A bill may be introduced into either House by a member of that House. When it has been introduced, it is read a first time and is printed by order of the House. The stage of first reading is formal. On the second reading questions of principle are discussed. If the second reading is affirmed, the bill goes to a committee, which, in the House of Commons, is either a committee of the whole House, or one of the standing committees on bills, or a select committee. In the absence of special order it goes, under the existing orders, to a committee of the whole House.

A committee of the whole House is really the House itself sitting in a less formal manner, presided over by a chairman at the table, the speaker's chair being vacant, and freed from some of the restrictions which attach to proceedings when the speaker is in the chair.

The standing committees on bills, of which there are at present two, are constituted by the committee of selection, and are intended to be microcosms of the whole House. Each of them consists of not less than 60 members, and the quorum of each is 20.

A select committee is appointed by the House, and its members are nominated by the House itself, or, in some cases, either wholly or partially by the committee of selection. The nomination of members by the House is made in pursuance of arrangements between the "whips" of the several parties. There may be joint select committees of the two Houses. When a bill has gone to a select committee, it must subsequently pass through a committee of the whole House, but this is not a case with a bill sent to a standing committee.

At the committee stage a bill is gone through clause by clause, and amendments are proposed, discussed, and, if agreed to, made in the bill. When the consideration of a bill in committee is concluded, it is reported to the House, with or without amendments, as the case may be. On consideration of the report, there is an opportunity for making further amendments.

The next stage is the third reading. In the House of Commons this is the final stage, and only verbal amendments can be proposed. In the House of Lords substantial amendments can be moved at this stage, and also on the subsequent question, not put in the House of Commons "that this bill do pass."

When a bill has been passed by either House it is sent by message to the other House to pass through its several stages there. If the second House amends a bill thus sent to it, it requests the concurrence of the originating House in the amendments. Should the two Houses differ, amendments and counter amendments pass to and fro until an agreement is arrived at. Until the Parliament Act of 1911, if no agreement could be arranged, the bill

dropped. If a public bill was not either passed or withdrawn in the course of a session, it lapsed at the end of that session.

The Parliament Act, however, introduced some profound modifications in constitutional procedure and parliamentary practice. These changes are explained in the next article.

The final stage of a bill is the royal assent, which is given, by commission, in the House of Lords, in the presence of representatives of both Houses. As the king can only act on the advice of his Ministers, who presumably command a majority in one of the two Houses, the royal assent to a bill is now given as a matter of course. The last instance of refusal was in the reign of Queen Anne.

A distinction is drawn between public bills, the object of which is to alter the general law, and private bills, the object of which is to alter the law relating to some particular locality, or to confer rights on or relieve from liability some particular person or body of persons. The procedure on private bills differs materially from that on public bills, and is governed by a different set of standing orders.

Every private bill goes, after second reading, to a small committee, before whom, if the bill is opposed, witnesses are called and counsel heard. The proceedings before these committees are quasi-judicial in their nature. Many things which used to be done by private bills, are now done by provisional orders, which are made by a public department, after local enquiry, and when made, are confirmed by provisional order confirmation bills, to which they are scheduled. Sometimes, to prevent hardships, the proceedings on a private bill are continued, by special order, to another session.

The right of granting money in Parliament belongs exclusively to the House of Commons. The House of Lords assents to, and could reject, a grant of money, but cannot initiate or alter a grant. The Parliament Act (q.v.) deprived the Lords of all powers to interfere with money bills.

The right of the House of Commons to grant or raise money is subject to two important restrictions. It cannot vote money except in pursuance of a request from the Crown. It cannot impose or increase a tax unless the tax or its increase is declared by the constitutional advisers of the Crown to be necessary for the public service.

The demand by the Crown for the grant of money for the service of each financial year is made in the speech from the throne at the beginning of each session. As soon as practicable afterward estimates are presented to the House showing the amount which will be required for the public service. Supplementary financial estimates for the current financial year are also, if necessary, presented. The ordinary annual estimates are presented in three parts or divisions, each comprising one of the three branches of the public service, namely, the navy, the army and the civil service. Each estimate contains first, an estimate of the total grant thereby demanded, and, then, a statement of the detailed expenditure under each grant, divided into sub-heads or items. For the purpose of considering these estimates, and voting the money required, the House resolves itself, at the beginning of each session, into a committee of the whole

House, which is called the committee of supply. Not less than 20 days must be allotted in each session for the sittings of this committee. Votes which have not been previously considered and disposed of by the committee are passed *en bloc* at the end of the session. When the resolutions for the votes have been passed by the committee they are reported to and confirmed (technically "agreed to") by resolution of the House. Resolutions authorizing the grant, out of the consolidated fund of the money required to make good the supply voted in committee of supply, are passed by another committee of the whole House, called the committee of ways and means, and are also confirmed by resolutions of the House. And these resolutions are finally confirmed by one or more Acts of Parliament called Consolidated Fund Acts, and by the annual Appropriation Act which is passed when the supply for the year has been disposed of. Before the end of each financial year a vote on account is always necessary to supply the current expenses of the civil service during the next financial year, and, for a similar reason, a sufficient amount of money must also be voted for the navy and army, in whose case there is greater facility for transferring money provisionally from one vote to another. A Consolidated Fund Act confirming these votes must also be passed before the end of the financial year, i.e., before March 31. It follows from the principles laid down above, that the committee of supply and the House can reduce, but cannot increase, a grant asked for by the estimates. Nor can they alter its destination.

Once a year the Chancellor of the Exchequer, in committee of ways and means, makes his annual budget statement, reviewing the revenue and expenditure of the past financial year, estimating the revenue and expenditure for the next financial year, and proposing such increases or remissions of taxation as are in his opinion required for, or justified by, the position. These proposals are embodied in resolutions which, when passed by the committee of ways and means, and agreed to by the House, are confirmed by an Act of Parliament, called the Finance Act of the year. Here again the House and its committee can dissent from, or reduce, a proposed tax, but cannot impose or increase a tax.

Under the Cabinet system the executive government is dependent on the support of Parliament, and, in particular, of the House of Commons. The king appoints a Prime Minister who can command a majority in that House. The Prime Minister selects the members of his Cabinet, and the holders of minor political offices, from among those of his followers who have, or are likely to have, seats in one of the two Houses. The Ministry as a whole, and each Minister separately, is responsible to Parliament, and particularly to the House that supplies the money without which government cannot be carried on. If a Ministry cannot retain the confidence of that House the Prime Minister must either resign or appeal to the country by a dissolution of Parliament.

The control of the House of Commons over the executive government can be exercised, not only by withholding assent to the legislative and financial proposals of the government, but in various other ways. Thus it can obtain information as to the proceedings of the gov-

ernment by means of questions and of orders for the production of documents.

Any member has the right to address a question to any Minister of the Crown, being also a member of the House, about the public affairs with which he is officially connected, or a matter of administration for which he is responsible. The proper object of such a question is to obtain information on a matter of fact within the special cognizance of the Minister, and the rules and practice of the House limit the right to ask questions so as to confine them to this object. Except in special cases, notice of any such question must appear on the notice paper at least one day before the answer is to be given. If a member wishes his question to be answered orally, he marks it with an asterisk, and a time is set apart at the beginning of each afternoon sitting for the answering of such questions. Debate is not allowed during this period, but an unsatisfactory answer may, if the matter is of sufficient urgency and importance, give rise to a motion for adjournment, so as to provide opportunity for discussion at a later period of the day.

The House can, on the motion of any member, obtain returns supplying such information on matters of public importance as is obtainable through departments of the government. A motion for a return may be opposed on grounds of public policy, such as that the disclosure of the information sought is not for the public interest, or that its supply would involve unreasonable labor and expense, but much information thus sought is periodically supplied in the form of "unopposed returns." The government can also, and frequently does, on its own initiative, lay papers before the House. Such papers are known as "Command Papers." These returns and papers, together with the returns presented in pursuance of directions contained in Acts of Parliament, and the Reports of Parliamentary Committees and of Royal Commissions, make up the formidable mass of official literature popularly known as "Blue Books."

But the principal opportunity for criticising the administrative action of the government is afforded by the discussions in committee of supply, for which, as has been stated above, a minimum number of days must be set aside in each session. On the old principle that redress of grievances should precede the grant of supply, the action of each Minister and of the departments and officers over whom he has control, can be discussed on the vote for the branch of expenditure concerned. As has been seen, the House can reduce but cannot increase expenditure proposed by the Crown, and therefore any complaint made in committee of supply must be based on a motion for reduction of a vote, even, paradoxical as it may seem, though it be a complaint of insufficient expenditure. Other opportunities for criticising the action of the government and raising questions of public policy are supplied by the debate, at the beginning of each session, on the address in reply to the speech from the throne, by debate on motions which must be made when the House first goes into committee of supply on the navy, army and civil service estimates respectively, by the evening sittings appropriated to the discussion of private members' motions, by the second and third reading stages of the Consolidated

Fund Bills and the Appropriation Bill, and by the motions which have to be made for the adjournment of the House over a recess.

A full account of parliamentary procedure would be impossible here. Some points have been touched on above, a few others may be briefly noted.

Each House has power to make its own orders, supplementing or modifying its customary rules of practice. A standing order continues in force until repealed. Other orders may be made for a particular session, for a more limited period, or for a particular occasion.

In the House of Commons any question of the law or practice of the House is decided, as a point of order, by the speaker, or, in committee, by the chairman.

In the House of Commons, government business has precedence at most sittings, and Thursdays are usually devoted to committee of supply. Private members' bills have precedence on Fridays, and private members' motions have precedence, during part of the session, between 8.15 and 11 on the evenings of Tuesday and Wednesday.

The quorum of the House of Commons, and of a committee of the whole House, is 40, including the speaker or chairman. (In the House of Lords the quorum is 3).

A matter requiring the decision of the House or of a committee is decided by means of a question put from the chair on a motion proposed by a member.

If the opinion of the speaker or chairman as to the decision of a question is challenged, he allows two minutes to elapse, in order to enable members to assemble, and then puts the question again. If his opinion is again challenged he directs the 'ayes' to go to the right and the 'noes' to the left, and appoints two tellers for each. The 'ayes' and 'noes' then pass through their respective division lobbies, on each side of the House, their names are taken down by the division clerks, and they are counted by the tellers, who announce the result at the table of the House.

If a debate on a question is unduly protracted, it can be terminated by means of what is called the closure, the procedure on which is as follows: A member rising in his place may claim to move "That the question be now put," and, unless it appears to the chair that the motion is an abuse of the rules of the House, or an infringement of the rights of the House, this preliminary question must be put forthwith, and, if it is carried, the main question is put forthwith and decided without amendment or debate. But a motion for the closure cannot be carried unless it appears on a division that not less than 100 members voted in the majority in its support. The result is to leave to the chair discretion as to the time and circumstances in which closure should, with propriety, be granted.

The speaker and chairman are also clothed with powers for checking irrelevance, prolixity, repetition and obstruction, for preventing the abuse of dilatory motions, and for maintaining order and decorum. If a member is guilty of grossly disorderly conduct, the speaker or the chairman of a committee of the whole House can order him to withdraw from the House.

If a member disregards the authority of the chair, or abuses the rules of the House by persistently and wilfully obstructing its business, he can be "named" for the offence by the speaker or by the chairman of a committee of the whole House, and the House can, on motion made, make an order suspending him from the service of the House for the rest of the session. Orders of this kind, when made by the House, or by the speaker or chairman, are enforced if necessary by the sergeant-at-arms with such assistance as may be required. In the case of grave disorder arising in the House, the speaker may, if he thinks it necessary, adjourn the House without question put, or suspend the sitting.

The Parliament at Westminster is not only the oldest, but the mother of all existing Parliaments. Those who framed the constitution of the United States took the British constitution as their model, but studied it through the spectacles of Montesquieu, and thus brought about that separation between the executive and the legislative powers which makes such an essential difference between the British House of Commons and the American Congress. English parliamentary procedure has made the tour of the world. The rules adopted by the French assembly after the Restoration were based on a sketch of English parliamentary procedure supplied to Mirabeau by Dumont. The influence of English practice, derived either directly or through the medium of France, can be traced in the procedure of all Continental legislatures. Thomas Jefferson, when President of the United States, drew up for the use of Congress a manual consisting largely of extracts from English parliamentary precedents, and Jefferson's Manual is still an authoritative work. Every legislature of a British colony conforms to the rules, forms, usages and practices of the British House of Commons, except so far as they have been locally modified. Of all parliamentary institutions throughout the world the Parliament at Westminster remains the archetype.

Clerk of the House of Commons; author of  
'Parliament,' 'The Mechanics of Law  
Making.'

**12. PARLIAMENT ACT, 1911.** This important measure was introduced by the Asquith administration in April 1910, with a threefold object: (1) to reform the House of Lords by substituting a popular or representative basis for the hereditary one then (and still) existing; (2) to restrict the vetoing powers of the Lords in regard to money and other bills; and (3) to reduce the life of a Parliament from seven to five years. Though the entire measure became law, no step had been taken up to 1918 to alter the constitution of the Upper Chamber; the two other provisions are in force. The measure was forced through the House of Commons on 15 May 1911, after a series of stormy debates lasting 23 days, thus bringing to a close the historic struggle which had raged between the two Houses of Parliament for 18 months. See **POLITICAL PARTIES**.

The act provided (1) that if a money bill, having been passed by the Commons, and sent up to the Lords at least one month before the end of the session, is not passed by the House of Lords without amendment within one month after being so sent up, the bill shall become law, notwithstanding that the Lords have withheld their consent. It was left to the speaker to decide what is or is not a money bill, and his certificate to that effect must accompany the bill on its journey to the Lords; (2) if any bill other than a money bill is passed by the House of Commons in three successive sessions (whether of the same Parliament or not), and is rejected by the Lords in each of those sessions, it shall become an act of Parliament on its third rejection. This provision, however, does not take effect unless two years have elapsed between the date of the first introduction of the bill and the third passing in the House of Commons. If the House of Lords does not pass any such bill without amendment, it shall be deemed to be rejected unless the amendment meets with the approval of both Houses. It will be seen at a glance that the Parliament act not merely "restricted" the veto of the House of Lords, but removed it altogether, leaving in its place only the power to "hang up" a measure, in other words, to delay a legislative proposal without being able to make any alterations or amendments unless the other House agrees to accept them. The House of Lords being at all times overwhelmingly conservative, it had long been a legitimate grievance of Liberal administrations that their legislative measures suffered far more severely than did those of the Conservative or Unionist party, when in power, at the "revising" hands of the Lords. After weeks or months of fierce Parliamentary fighting, the Liberals had fre-

quently carried some highly contentious bill through a third reading in the Commons only to see it "thrown out" or extinguished by the Lords in a few minutes. The Parliament act removed that obstacle with one bold stroke.

A committee was appointed to inquire and report on the nature and limitations of the legislative powers to be exercised by the reformed Second Chamber, and the best mode of adjusting differences between the two Houses.

HENRI F. KLEIN,

*Editorial Staff of The Americana.*

**13. CROWN AND CABINET.** The crown is a chattel, and is kept in the Tower of London. But the genius of the British race, striving unconsciously toward the expression of national unity and permanence, has come to personify it as a power, which, though necessarily wielded by or in the name of an individual ruler, exists independently of the lives of kings and queens. The materials of which the crown is composed will outlast the lives of many rulers. Whilst they are mortal, is it not, in the strictest sense, immortal?

The late Dr. Hearn pointed out, in his admirable work entitled 'The Government of England,' that, in spite of the progress toward democracy of the 19th century, the British Constitution remained, in a very real sense, a monarchy. Not only is it still true that, as regards all foreign communities, the empire is represented by the monarch alone, and that it would be a gross breach of political etiquette for any person or body to attempt to open up any other channel of official communication with a foreign community, but it is equally true, that every internal act of State—legislative, executive, or judicial—both in the United Kingdom and in the dominions beyond the narrow seas, is done in the name of the monarch, and that no such act can be *ultra vires*. It is of the essence of the British conception of State sovereignty that the monarch is incapable of committing legal wrong.

This apparently Oriental dogma is, however, balanced by the equally fundamental doctrine, that for every political act of the monarch there is an appropriate agent, and that such agent acts at his peril. In some cases, the peril is remote and uncertain; in others it is prompt and definite. The Parliament which advises had legislation is amenable only to the judgment of the electors expressed at the polls. The judge who abuses his office, though he may be dismissed by the monarch for actual illegality, is amenable, so far as the citizen is concerned, only to the vote of Parliament. But the executive official who breaks the law is liable to an action in the ordinary courts by the humblest citizen whom he has injured; and his plea of "superior orders," though it may involve the superior also in liability, will not absolve the actual delinquent. And thus, inasmuch as, in the enormous complexity of State action, it is hardly possible for the personal act of the monarch to reach the individual except through the hands of some intermediary, the subject is rarely without redress. Even the House of Lords, the greatest anomaly in the constitution, can be made to feel the pressure of public opinion.

**The Independence of Ministers.**—The natural consequence of this fundamental principle of the responsibility of the Crown agent is the in-

dependence of the agent toward the Crown. Historically speaking, the claim of independence was first put forward by the judiciary, whose members, though for centuries both in law and in fact the servants of the monarch, liable to dismissal at pleasure, succeeded, before the end of the Middle Ages, in banishing the King from his own law courts, and in acting as an independent department of state. Down to the end of the 17th century, their success varied with the political balance of power; but it was assured, soon after the Revolution, by the Act of Settlement, which, in fact, made the judges independent of the Crown, though still, technically, liable to dismissal for actual misconduct.

Meanwhile, Parliament, a later institution than the courts of law, had, by a series of struggles which have made it famous in the world's history, succeeded, not merely in emancipating itself from the control of the monarch, but in establishing itself as an essential part of the national government. The history of these struggles is told elsewhere.

Here it is sufficient to remember that, on his restoration to the throne, Charles II realized that Parliament could be cajoled, but could no longer be bullied. Even the enthusiastic loyalty of the Restoration Parliaments would not tolerate violence, though it fell a somewhat easy prey to the more sinister influence of corruption.

The executive was much longer in securing its independence. Down to the Revolution, the holders of executive offices were, in fact as well as name, "His Majesty's servants." Outside legislation and judicature, the personal will of the King directed the policy of the country, subject only to the indirect check of a refusal by the House of Commons to grant supplies. But, with the accession of a foreign ruler, in the person of William III, and a renewal of the foreign element with the accession of the House of Brunswick, affairs rapidly changed. William was absorbed in great foreign schemes, and left home affairs to his Ministers. Anne was lethargic, and indifferent to matters which did not concern her personal comfort or the interests of the Church. George I knew no English, and soon ceased to attend meetings of the Council, except purely formal meetings where his presence was absolutely essential. Thus the real control of affairs passed into the hands of the great officials of state.

At this point there was a real danger (not sufficiently appreciated by English historians) that the government of England would become a bureaucracy, each department in effect the private preserve of its chief, pursuing its way regardless of, or even in opposition to, the other departments, and intriguing for power and privilege. From this danger the country was saved by the peculiarities of the political situation, and by the financial power, based on long established tradition, of the House of Commons.

**Ministers and the House of Commons.**—During the first half of the 18th century, the dominating feature of the political situation was the possibility of a Jacobite restoration. So long as the throne was occupied by a daughter of James II, or even by the husband of one of those daughters, the country accepted the Revolution settlement with acquiescence, if not with enthusiasm. But, when it became clear that

Anne would leave no heir, the hopes of the Jacobites revived. It was with difficulty that the Queen herself had been brought to accept the scheme of the Act of Settlement of 1701, by which the succession to the throne, on the failure of her issue, had been settled on the Princess Sophia of Hanover, the granddaughter in the female line of James I. The politically useful legend, that the "Old Pretender" (the son born to James II on the eve of his flight) was a supposititious child, had long been exploded; the child himself, now a young man of winning personality, was prepared, at Anne's death to vindicate the claim which had passed to him on the death of his father; and the Queen was believed to sympathize fully with his ambitions. The House of Hanover was regarded as a mere stalking-horse for the ambitions of the Whig statesmen; and the first two of its princes to occupy the throne of Great Britain and Ireland were looked upon by the mass of the people as foreigners. In 1715, and again in 1745, the fate of the throne trembled in the balance.

Thus the Ministers of George I and George II carried their lives, or at least their fortunes, in their hands. A Jacobite restoration meant, at the very least, banishment and confiscation for them, if not something worse. They could not afford to run unnecessary risks.

There can be little doubt that the Whig leaders would have been glad, in spite of their constitutional principles, to dispense with the presence of Parliament during these troubled years. Apart from the possibility—the probability—that it might result in an accession of strength to the Jacobites in the House of Commons, there was always the fear that the license of a general election would be made the cover of a Jacobite *coup de main*. This fear is shown by the striking step taken soon after the accession of George I; when the Parliament, at the urgent instigation of Ministers, prolonged the term of existence, not merely of its successors, but of itself, from three to seven years, by the Septennial Act of 1715.

Fortunately, however, it was not possible for the Whig leaders to dispense with the assistance of Parliament; and this for the good old reason which had for so long been the sheet-anchor of Parliament in its struggle for power. In spite of the large hereditary revenue settled upon the Crown at the Restoration, and the rich inheritance of the Crown lands, George I and George II, like their predecessors, continually needed money; and the only stable source of money was a vote of the House of Commons. The chief secret of Walpole's favor at court, as well as of his ascendancy over his colleagues, was the power which he possessed of securing this vote. For the first time in the history of England, the power of the executive depended, openly though not officially, on the fluctuating moods of the representative House.

Gradually, then, by the teaching of events, the Ministers of George I and George II began to realize the conditions upon which Cabinet government depends for its success. It was necessary, if they were to prevent the commission of blunders which might bring down the dynasty and its supporters in one common ruin, that they should, in fact, control the action of the king. To secure this control, naturally very distasteful to monarchs brought up in the abso-

lulist traditions of mediæval Germany, it was necessary that they should (under forms of deferential politeness) be able both to coerce and to bribe the occupant of the throne. So long as they acted as individuals, the former object was unattainable; for both George I and George II were quite shrewd enough to be able to play off one rival against another. But a threat of resignation by all his Ministers at once was more than a foreign ruler, ignorant of the temper of his subjects and of the machinery of government, could safely disregard. Equally was it desirable, if not essential, that Ministers, if they desired to bribe the king, should act together. For the means of bribery were only to be obtained from the House of Commons; and that House, though it doubtless regarded this new harmony of Ministers with deep suspicion, found it more difficult to refuse supplies demanded by the unanimous voice of the government, than when it could plead as an answer to the demands of one Minister, that his colleagues differed from him as to the wisdom of his plans. Thus gradually, from no very honorable motives, but as a mere counsel of expediency, Ministers acquired the habit of talking over their plans together; and the rival, and often openly quarrelling Ministers of William III and Anne, were replaced by the Cabinets of George I and his son. No doubt the unanimity, such as it was, was mainly superficial; but, for all that, in a matter wherein appearances counted for much, it was important.

**The Modern Cabinet.**—So much it seemed necessary to say to account for the appearance in English politics of a phenomenon so remarkable as the Cabinet, and so difficult to refer, for an explanation of its origin, to any particular crisis or any official document. Indeed one of the most striking features of the Cabinet system is its wholly informal character—a feature which adds both to its utility and to its interest as an object of study. It is natural, no doubt, that no one but those who have taken part in its proceedings should be able to speak authoritatively of the details of the working of a great political organ. But it is none the less curious that, until the appearance of the masterly essay of Bagehot, entitled ‘The English Constitution,’ in 1867, even the general outlines of the system by which they had in fact been governed for upward of a century should have been unfamiliar to a people so keenly interested in politics as the British. And yet that such was the case is shown by the almost ludicrous difficulties experienced by the self-governing colonies of Australia, when, in the 50’s, they endeavored to introduce it into their new constitutions.

But here we must leave the historical method, passing by the vigorous but unsuccessful attempt of George III to overturn a system which he thoroughly disliked, the brilliant new development introduced by Pitt in his gallant struggle against the coalition of Fox and North in 1784, the remonstrance made by Queen Victoria against the application of its principles to the famous ‘Bed-chamber’ question in 1839, and the more successful vindication of her rights by the same monarch against Lord Palmerston in 1850. Let us make some attempt to enumerate the essential features of the system as it exists to-day.

**Its Executive Character.**—The first point

to notice is, that the Cabinet is not a mere council of political experts, but a body of working administrators. With one or two exceptions, each of its members is actually responsible to Crown and Parliament for the conduct of some department of State. It is true that he is, almost invariably, chosen rather for his general political importance than for his skill in the affairs of his department, i.e., an office is found for him because his presence in the Cabinet is desirable. But, none the less, the official character of its members gives the Cabinet a power which no mere advisory council could ever exert. Not only is the Cabinet aware of the awkward secrets of public business, and the practical difficulties of carrying out any line of policy, it is its own executor; for, except in the improbable case of disloyalty to his colleagues, the Minister to whose department the carrying out of that policy belongs, at once insists upon its adoption by his subordinates, the officials of his department.

**Its Parliamentary Influence.**—In the second place, and still more important, the Cabinet wields vast Parliamentary influence. In effect, its members are invariably members of Parliament, though, legally speaking, no one of them need be; and most of them are men of commanding personal weight in the House of Commons. We have seen how the necessity of conciliating Parliament was forced upon the Ministers of George I and George II. It is now fairly well understood that the influence exercised by those Ministers was obtained by means not the most creditable. But the death-blow to Parliamentary corruption, already checked by the Place Act of 1742, was dealt when Pitt appealed from the House of Commons to the country in 1784; and the *coup de grâce* was given by the Reform Act of 1832. Since that date the place of the old sinister influence of the “spoils” has been taken by the organization of the party system (see **POLITICAL PARTIES**); and the substitution of examination for patronage, in the vast mass of appointments to the permanent civil service (q.v.) has rendered the working of the party system comparatively pure. For the most part, Ministers control Parliament by the support of followers who honestly believe their policy to be good, or, at least, the best available; and such corruption as exists is confined to the polling booths.

**The Escape of 1705.**—One of the most curious facts in the whole history of the Cabinet is that this control of Parliament by Ministers was very nearly becoming, so far at least as the House of Commons was concerned, a legal impossibility. The Act of Settlement of 1701 (so often alluded to) contained a clause expressly excluding from the representative House all holders of office under the Crown. This part of the act, however, was not intended to take effect until the accession of the House of Hanover; and, before that date, it had been repealed by another act of the year 1705. But neither the statesmen of 1701 nor those of 1705 appear to have had any idea of the importance of the question.

**Dependence of the Cabinet on the House of Commons.**—But it is of the first importance to remember that the influence of the Cabinet on Parliament is at least counter-balanced by the influence of Parliament on the Cabinet. Apart from the general attitude of the House of Com-

mons toward Ministers, which is, of course, vital, the opportunities which occur in both Houses for criticizing every action of the Executive are of daily occurrence during the session of Parliament. In fact, one of the chief cares of the Prime Minister in forming his Cabinet is to provide acceptable champions of its acts in either House. It is a constitutional maxim, that every department must be represented in both Houses, so that there may always be present some responsible Minister to explain and give information upon any point of administration which any member of either House may choose to raise. This explanation and information are rendered chiefly in the form of answers to questions of which due notice has been given; and a glance at the Question-Paper for any day will reveal the vast and detailed mass of information which Ministers must be prepared to supply to Parliament. A Minister can, of course, plead "reasons of State" for withholding information. But such a plea is apt to provoke suspicion; and if, for that or any other reason, the reply of a Minister is not considered satisfactory, further steps can be taken (such as a motion for adjournment, a proposal to reduce the estimates, or even a vote of want of confidence), in order to impress upon a Cabinet the error of its ways. The discussion on the budget is the grand opportunity for criticism of the executive by Parliament; and, though the power is sometimes abused, it cannot be denied that the constant liability of Ministers to justify their conduct in Parliament is one of the most valuable principles of the Cabinet system.

But the essential character of that feature of the Cabinet system which we are now discussing, is best proved by the unquestioned rule of constitutional custom: that a Cabinet defeated on an actual vote in the House of Commons must instantly either resign or persuade the king to dissolve Parliament. The former alternative, established by the resignation of Walpole in 1742, on the apparently irrelevant question of the Chippenham election, was long thought to be the inevitable sequel of defeat in the House of Commons. But Pitt, in 1784, added the second alternative, with striking success. Whether the king is bound to grant a dissolution upon the request of a Cabinet is a delicate question which is said to turn on the point whether the Cabinet was in office when the previous general election occurred. If so, the country has pronounced its opinion; and the Cabinet is not entitled to a second verdict. Probably, however, the true doctrine is, that if there is any reasonable probability of the Cabinet securing a majority in the country, it is entitled to a dissolution. Needless to say, if the verdict of the polls is against it, the Ministry at once resigns, as Gladstone's government did in 1874, and Lord Beaconsfield's in 1880. It may be incidentally remarked, that the fall of the Cabinet results in the resignation of about 30 other high officials, e.g., the law officers, the under-secretaries of state and the chief household officials, who, though not members of the Cabinet, are more or less in its confidence and are, in contrast to the permanent officials of the civil service, "liable to retire from office on political grounds." These removable officials, together with the Cabinet, constitute the "Government" or "Ministry."

**Informal Character of the Cabinet.**—The third cardinal principle of the Cabinet system is its completely informal character. The Cabinet is indifferently described as a committee of Parliament and a committee of the Privy Council; but, in law it is neither. It is true that in each House of Parliament there is a Ministerial (not a Cabinet) bench; and that, in the House of Commons, the Cabinet wields a great and growing control over business. None the less, it is undoubted that its members sit by virtue of their membership of the House and not by virtue of their offices and that the measures which they propose, though commonly called "Government measures," are, with the exception of financial proposals, technically brought forward in their capacity of influential members of the House, and not as Crown officials. Even the King's Speech, though unquestionably drawn up by the Cabinet, is delivered in the House of Lords by the King himself or by special commissioners; while in the Commons it is read by the Speaker, who is not a government official.

On its executive side, the Cabinet is equally informal. Its members are always made members of the Privy Council, in order that the oath of secrecy may be administered to them. But, as a body, it has no legal existence. It is never constituted by order in council, the clerk of the council is not present at its meetings, no minute or record of its proceedings is made, no decrees or orders are issued in its name, and it is never alluded to in Acts of Parliament, though the phrase "Responsible Minister of the Crown" is once or twice to be found in the Statute-Book. The various departments, such as the Admiralty and Treasury boards, have, by tradition or statute, certain limited powers of issuing orders and regulations; but, in the vast majority of cases, the deliberations of the Cabinet appear in the guise of Orders in Council, i.e., commands of the King, issued by the advice of the Privy Council, or in the form of simple executive acts of the Crown, signified through the appropriate Minister. Both these classes of acts always receive the personal approval of the King, in whose name they are done, though the approval of the Privy Council is a pure formality.

**The Unity of the Cabinet.**—Fourthly, the unity of the Cabinet is expressed by the Prime Minister, though it is only within a short time (January 1906) that the existence of the working head of the Ministry has been formally recognized, and that only by a place in the official Table of Precedence. No Prime Minister's department exists, though the estimates have recently provided for two or three private secretaries. Like his colleagues, the Prime Minister is simply the holder of an executive post, though it is usual to appoint him to a well-paid sinecure (First Lord of the Treasury, \$25,000) in order that he may have time to devote to the general policy of the government. But even this practice is very recent. Walpole, who really created the position of Prime Minister, always declined to assume the designation; and the fiction was long maintained by the unwise practice of charging the holder of the position with the actual cares of a working department, such as the Foreign Office or the Exchequer.

And, even now, the precise relations between the Prime Minister and the Cabinet as a whole depend more upon the nice balance of

circumstances than upon any well-defined tradition. The fact that the Prime Minister has been charged with the formation of the ministry, a fact which in itself is usually (though not always) a consequence of his election as leader of his party whilst in opposition, necessarily gives him a strong position with regard to his colleagues, who are, in a sense, his nominees. This advantage is strengthened by the rule that the collective decisions of the Cabinet are always communicated to the King by his mouth, while his prominence in the public eye tends also in the same direction. But the desirability of including in a ministry the ablest and most popular members of the party, the desire of avoiding any appearance of schism in the ranks of the government, and the almost unfettered discretion conceded to individual Ministers in the administration of their own departments, upon the business of which they communicate directly with the King, all combine to prevent the leadership of the Prime Minister, in normal circumstances, solidifying into actual control. Whether this result is desirable or not, may be regarded as an open question. On the one hand, a weak Prime Minister is said to imply a weak Cabinet; on the other, a Prime Minister of overpowering strength is not without his drawbacks. It is often said, for example, that the Liberal Party was driven into its long exile in 1895, because, in the later days of his leadership, none of his colleagues was "able to stand up to Mr. G."

**The Position of the Crown.**—In concluding this brief sketch of the working of the Cabinet system, it may be well to anticipate a criticism which every succinct account of the working of British politics is likely to raise in the mind of a reader not himself personally familiar with its atmosphere. A foreign observer may well be expected to say, though it would hardly ever occur to a Briton to say: "What then is the use of the King, if he is merely the mouthpiece of his Ministers; if, except on the rarest occasions, he is bound to accept the advice tendered to him by his constitutional advisors? Does it not really seem as though Carlyle's proposal for a 'cast-metal king' would fit the present British Constitution?"

The first answer to this criticism is the reminder that, though politics are an important side of public life in the British Empire, they do not by any means exhaust its interests. And the occupant of the throne is by no means confined to the sphere of politics. As the head of society, as the patron of religious, charitable, agricultural and scientific enterprises, as the encourager of art and sport, as the focus of that spectacular world which, even to the phlegmatic Briton, is no small share of his existence, the opportunities of the monarch are unlimited, and his personal discretion unfettered. To secure the presence of the King at any function, is to place success beyond the range of doubt. For the King to take a personal interest in the prosperity of a public enterprise, is the surest guarantee of its popularity. The King's Hospital Fund is but one of countless examples of this truth. And with all these matters the Cabinet has no concern.

But, even in the realm of politics, the King is very far from being the mere figure-head which superficial observers have sometimes

supposed. It is true that the splendid service which the King renders to the State as the embodiment and symbol of the unity and permanence of a world-wide empire is, perhaps, the greatest of all the functions of the Crown; and, it may be added, there can hardly be any position more truly splendid, more worthy of the highest powers, more capable of being used as an instrument of good. Its singular value is that, while it affords scope for the powers of genius, the position is capable of being reasonably well filled by any man or woman of moderate ability and first-rate training, while even an unworthy holder cannot do very much harm in it. In other words, it is a position singularly well suited to an hereditary monarch.

And it would be a great mistake to assume that, even in the realm of politics, the function of the monarch is confined to the outward show of things, and has no place behind the scenes, where the real fates of nations are decided. Bagehot, in his work before referred to, has summarized, with his usual justice, the political rights to which a constitutional monarch, in a system like the British, is entitled. He has "the right to be consulted, the right to encourage, the right to warn." And, as the same writer very truly remarks, such rights, in the hands of a monarch of sense and sagacity, and it may be added, of experience, are singularly effective. In modern conditions, the air of a court is by no means so fatal to width of outlook and knowledge of the world as in the days before the popular press and facile travelling. The late Queen Victoria, for example, was learning politics by instinct when many of her future Ministers were absorbed in the sports of youth or the narrow cares of professional life. Words of warning or encouragement must have fallen with singular force from her lips upon the ears of men upon whom rested the tremendous responsibilities of empire; while the completeness with which she could enforce her undoubted constitutional rights was shown in the famous letter in which she consigned Lord Palmerston to temporary oblivion in 1850. On that occasion Her Majesty simply insisted upon her undoubted right to be distinctly informed of every event, in contemplation or progress, which might result in an act of the Crown, "in order that she may as distinctly know to what she is giving her royal sanction."

Of late years suggestions have from time to time been made to the effect that the occupant of the throne should take a more personal and ostentatious part of the details of government. These suggestions not only savor of the political backwater, but they are singularly ill-advised in the interests of the monarchy. Britons feel so keenly upon political matters, that anyone, however exalted, who takes part in controversial or debatable matters, inevitably meets with hostile criticism and periods of unpopularity. From such untoward accidents the Crown is entirely saved by virtue of its present unique position. Even where, as during the last two eventful years of the Balfour Ministry, the policy of the government was unpopular with the majority of the community, no one dreamed of blaming the King, for everyone assumed that he had nothing to do with it. "The King has no politics, and no one knows to which party he belongs." How different was the attitude of the country to George III during the

long period in which he strove to restore the older type of monarchy. But perhaps the most complete testimony to the success of the present system, so far as the Crown is concerned, is the fact that republicanism, even as an academic ideal, has practically ceased to exist in the British Empire. Among all the schemes of political reform which are from time to time mooted, no one ever contemplates the disappearance or modification of the powers of the Crown; for the very good reason that the Crown, so far from being a stumbling-block in the way of reform, is seen to be capable of being employed as a valuable instrument to secure it. The working of the Cabinet system makes the Crown a splendid fixed sun, surrounded by a constellation of rolling planets destined, from time to time, to disappear from sight. No one becomes tired of the sun, because the desire for occasional change, planted in every human breast, is satisfied by the appearance and disappearance of the planets. The Cabinet system may be open to severe criticism; but its defects will not be amended by any change which will reduce the monarch from his proud position as head of a united nation, to the leadership of a faction of irresponsible politicians, opposition to whom would mean opposition to the avowed personal wishes of the Crown.

**Bibliography.**—Considering its importance, very few writers have attempted to deal in detail with the history and working of the Cabinet system. The following works will be found useful in studying the subject. *History*: Morley, 'Walpole' (English Statesmen Series); Jenks, 'Parliamentary England' (Story of the Nations Series). *Working*: Bagehot, 'The English Constitution' (1867); Hearn, 'The Government of England' (chaps. viii-x); Anson, 'Law and Custom of the Constitution' (part II, The Crown, chap. iii, 3d ed., Oxford 1909); Traill, 'Central Government' (English Citizen Series).

EDWARD JENKS,

*Principal and Director of Legal Studies of the Law Society.*

**14. THE JUDICIAL SYSTEM IN ENGLAND AND WALES.** The English judicial system, like the English law, grew up naturally and spontaneously. It is of native growth. It has never been constructed *en bloc* on any scientific or strictly logical principle; but it is perhaps none the worse for this. It still contains anomalies, which are relics of Anglo-Saxon custom or Norman feudalism; but such anomalies are historically interesting and do not at all seriously impede the working of the more modern machinery.

We now draw a sharp distinction between courts of civil and courts of criminal jurisdiction. In the former debtors are compelled to pay the money which they owe, and wrongdoers to compensate those whom they have injured; so that the proceedings, if successful, generally end in a judgment that the defendant shall pay the plaintiff so much money. The object of criminal proceedings, on the other hand, is to punish more serious offences and to prevent their repetition. Hence these proceedings, if successful, terminate in a sentence inflicting fine or imprisonment on the offender. And for each purpose we now have separate courts. This was not so formerly. At the

time of the Norman conquest the most important tribunal in England was the Shire-moot, or County Court. This court took cognizance of felonies, breaches of the peace, nuisances, and other offences which concerned the State, as well as of actions involving title to lands and other civil suits, which concerned only the individual suitors; it also heard appeals from inferior tribunals, such as the hundred court. In Saxon times the County Court met twice or thrice a year. In the 13th century in the larger counties it met every month.

Under Henry II the royal power made itself felt throughout the kingdom. His justices in eyre made their circuits through the land and tried the more important civil and criminal cases in the County Court. By the Assize of Clarendon (1166) all landholders were obliged to attend twice a year to meet the King's justices. This was the origin of the County Assizes. To this day the King's judges still come at least twice a year into every county in England. To the larger counties two judges come together, one of whom tries civil causes and the other criminal cases—

"The great judge and the little judge,  
The judges of a shire!"

From the ordinary meetings of this ancient County Court are descended both the County Quarter Sessions and the modern County Courts. At the Assizes any crime can be tried which had been committed within the county, whether treason, felony or misdemeanor. At Quarter Sessions no crime can be tried, which is punishable with death or imprisonment for life (except burglary); other grave offences, such as perjury and forgery, are also excepted. These Sessions are held at least four times a year in each county; the justices of the peace for the county—unpaid laymen—are the judges.

The civil jurisdiction of the ancient County Court had become almost obsolete, when the County Courts Act of 1846 was passed. This act created the modern County Court, which is held in every town of any size in England at least six times a year. Actions for breach of promise of marriage, libel, slander and seduction cannot be commenced in the County Court; nor can actions of ejectment or any other action involving the title to any land worth more than £50 (\$250) a year, or to any toll, fair, market or franchise; nor any action of contract or tort, in which the plaintiff claims more than £100 (\$500). This latter does not apply to actions under the Workmen's Compensation Act, where no limit is fixed. Outside of London the County Courts have jurisdiction in bankruptcy. There are 57 County Court judges; they are appointed by the Lord Chancellor, and must be barristers of at least seven years' standing.

So much for the counties. But even in Anglo-Saxon times, cities such as Winchester, York and London had acquired the right of holding courts of their own in which an officer appointed by the citizens themselves would decide all civil disputes which arose within the limits of the city, and also exercise some criminal jurisdiction over the citizens. In less important towns, however, it was found difficult to exclude the jurisdiction of the County Court. But in the 13th and 14th centuries the policy of the Crown was to strengthen the towns in order

to create a counterpoise to the power of the nobles. The three Edwards and Richard II granted many charters to boroughs, which created borough courts of criminal and in some cases also of civil jurisdiction. The citizens were proud of these local courts, for they were a badge of their independence. Some of them have fallen into disuse; from the others are directly descended our present Borough Courts of Quarter Sessions and our civil Borough Courts of Record.

In 111 of the larger towns in England and Wales there is held at least four times a year a Court of Quarter Sessions, which has the same criminal jurisdiction and adopts the same procedure as the Court of Quarter Sessions in a county. The judge of each of these courts is called a Recorder. He is the sole judge of the court, for although the justices of the peace for the borough are often present on the bench, they take no part in the proceedings. A Recorder is appointed by the Crown on the recommendation of the Home Secretary. He must be a barrister of not less than five years' standing. He is *ex officio* a justice of the peace for the borough. He may sit in Parliament for any other constituency but not for the borough for which he is Recorder. The Recorder of London is judge of the Lord Mayor's Court, with a salary of \$20,000. He is appointed by the King. There are 118 recorders in England and Wales, and five in Ireland.

In 18 of the largest cities or towns there exists also a Borough Court of Record of civil jurisdiction—such for instance as the Mayor's Court, London; the Court of Passage at Liverpool; the Salford Court of Record, and the Tolzey Court at Bristol. The jurisdiction of these courts is generally limited to causes of action arising within the borough, but unlimited as to the amount which can be claimed in the action. In most of them the Recorder of the borough is the judge.

When our Plantagenet kings were firmly established on the throne, judicial power became more centralized. The King's Council gradually extended the scope of its operations. It acquired important judicial functions; it became a court in which the King, in theory, was always present. From this council sprang gradually the courts of King's Bench, Common Pleas and Exchequer; which for many centuries were the three Superior Courts of Common Law at Westminster.

Then as civilization advanced, it was found that the rigid rules of the common law required modification to meet special cases. Ancient custom had to yield to improved morality. The Lord Chancellor, who was at first an ecclesiastic, became "the keeper of the King's conscience." He presided over the Court of Chancery, which soon assumed power to restrain suitors from "unconscientiously" enforcing their strict legal rights. This Court of Equity, which usually sat in Lincoln's Inn, thus acquired control over the three courts of law at Westminster. Two systems of judicature in fact flourished side by side, which were in many respects at variance with each other. What was right at law was often wrong in equity. Judgment would be given on the same facts for the plaintiff in Westminster Hall, for the defendant in Lincoln's Inn.

By the end of the 18th century the Court of

Chancery had become more technical, if that were possible, than the courts of common law themselves; its procedure had ceased to be elastic; it would only grant relief in certain specified cases. A plaintiff, who had undoubtedly a strong moral claim, was constantly told that he had no equity. And both at law and in equity, cumbrous procedure, technical pleadings and preposterous rules of evidence caused the suitors much vexation of spirit, much unnecessary expense, and worst of all, intolerable delay. "Lord Eldon and the Court of Chancery pressed heavily upon mankind" (Bagehot).

Attempts were made from time to time to deal with this state of things by legislation—notably by the Common Law Procedure Acts of 1852 and 1854, the Chancery Procedure Act, 1852, and the Consolidated Orders in Chancery of 1845 and 1860. At last in 1873, Lord Selborne, then Lord Chancellor, with the assistance of Lord Cairns, his opponent in politics, carried successfully through Parliament the Judicature Act, which came into force on 2 Nov. 1875. This act created the Supreme Court of Judicature, which administers law and equity concurrently. Its procedure is straightforward and simple. Every court now applies the same principles of law and equity to the actual facts of the case; every court has power to grant whatever form of relief the nature of the case may require, whether legal or equitable. This was the greatest and most beneficial law reform of Queen Victoria's long reign. On 4 Dec. 1882 outward expression was given to this fusion of law and equity by physically uniting the courts in one building—the new Royal Courts of Justice.

The Supreme Court of Judicature is composed of the Court of Appeal and the High Court of Justice. Thus the civil courts at present are: The County Court, the Borough Court of Record, the High Court of Justice, the Court of Appeal, the House of Lords and the Judicial Committee of the Privy Council. The High Court of Justice is divided into the Chancery Division, the King's Bench Division and the Probate, Divorce and Admiralty Division.

The Chancery Division has now six judges who work in pairs, each pair having four masters and a staff of clerks working under them. The bulk of the work of the Chancery Division consists of the equity business, to which its organization is especially adapted. Its powers are, nevertheless, not confined to any particular subject-matter; it administers law as well as equity, though it never tries a case with a jury.

The Lord Chief Justice of England, assisted by 15 *puisne* (i.e., junior) judges, conducts the business of the King's Bench Division. These judges try civil cases either with or without a jury; they preside at the Assizes, civil and criminal, all over England and Wales; they hear appeals from County Courts and magistrates, and prohibit all inferior tribunals from exceeding their jurisdiction.

In the Probate, Divorce and Admiralty Division there are two judges who decide as to the validity of wills, grant divorces and manage the admiralty business of the country. One of them is styled the "President" of the Division.

The rules of court made under the Judicature Act have defined the procedure in the High Court of Justice, which is simple and elastic. A Master now decides all interlocutory matters

on a summons for directions, e.g., whether the action shall proceed with or without pleadings, with or without a formal trial, with or without discovery of documents and interrogatories as the nature of the case requires. Every amendment in any record, pleading or proceeding that is requisite for the purpose of deciding the real matter in controversy can be made at any stage of the proceeding.

The Court of Appeal is composed of the Master of the Rolls and five Lords Justices, with the occasional assistance of the Lord Chancellor, the Lord Chief Justice of England, and the President of the Probate, Divorce and Admiralty Division.

The Lord Chief Justice of England, the Master of the Rolls, and the Lords Justices are appointed by the Prime Minister; the puisne judges of the High Court of Justice are appointed by the Lord Chancellor. The latter is *ex officio* chairman of the House of Lords and has a seat in the Cabinet. He goes out of office with the government. (See *Lord High Chancellor*).

From the decision of the Court of Appeal, appeal lies to the House of Lords—to the judicial body known by this name, not to the legislative assembly. An ordinary peer of the realm can no longer sit in the House of Lords when it is exercising judicial functions. The Judicial Committee of the Privy Council hears appeals in ecclesiastical matters and also from the colonies. These appellate courts will probably soon be merged in one; they have been strengthened by the appointment of six paid Lords of Appeal in Ordinary. A Court of Criminal Appeal was established in 1907, to which any person convicted on indictment may appeal on a question of law, or, by leave, on a question of fact, or against the sentence unless that is fixed by law. But there is no power to order a new trial.

The criminal courts now are: The Magistrate's Court, the Borough Quarter Sessions, the County Quarter Sessions, the Assizes, the Central Criminal Court, the King's Bench Division of the High Court of Justice and the Court for the consideration of Crown Cases Reserved.

The proceedings usually commence with a *summons*, bidding the accused appear in court before the magistrates on a certain day: in some cases a *warrant* will be issued at once for his arrest. Simple matters are disposed of summarily by the magistrates. Graver cases are sent for trial to Quarter Sessions or to the Assizes. In these graver cases, the prosecution states in detail the precise charge against the prisoner in a pleading which is called an *indictment*. This is laid before a *grand jury*; and the accused will not be put on his trial unless the grand jury think that there is a case against him fit to be tried. If the grand jury is of this opinion they return the indictment into court, marked "True bill," and the prisoner is then *arraigned*. In some few cases the prisoner must state his defense in a written *plea*; but, as a rule, he merely pleads "guilty" or "not guilty" orally from the dock. If he pleads "guilty," or if after pleading "not guilty" he is tried and convicted, he may be sentenced to fine, imprisonment, or death, according to the nature of the crime which he has committed.

The Central Criminal Court—better known

as the Old Bailey—tries all treasons, felonies and misdemeanors committed in the Metropolitan district or within the jurisdiction of the admiralty. The lighter crimes are usually disposed of by the Recorder of London or the Common Sergeant; the graver by a judge of the High Court, who attends for the purpose. This court is at once both Assizes and Quarter Sessions for the city of London, and assizes for the counties of London and Middlesex and for certain specified portions of the counties of Essex, Kent and Surrey.

The King's Bench Division occasionally exercises jurisdiction as a court of first instance in cases of grave public importance, such as the trials at bar of Dr. Jameson and Colonel Lynch in 1896 and 1903 respectively. It also has an appellate jurisdiction over cases brought before it on writs of error or certiorari or on "special cases" stated by justices of the peace.

The court for the consideration of Crown Cases Reserved was the only criminal court of appeal till 1907, when its jurisdiction was transferred to the Court of Criminal Appeal. That court consists of eight judges of the King's Bench division and the Lord Chief Justice of England. The number of judges sitting in the Court of Criminal Appeal must be an uneven one, and not less than three.

In the County Court and before magistrates, solicitors act as advocates. In all the other courts only barristers can be heard at the actual trial, or on "appeal"; though solicitors are allowed to argue minor questions in Judges' Chambers. A barrister must be a member of an Inn of Court; he must have passed the bar examination, and then have been "called to the bar" by his Inn. The four inns of Court in London possess the monopoly of calling men to the bar; they will not "call" any woman. In litigation in the High Court it is necessary to employ both a solicitor and a barrister; the solicitor prepares the case for trial, and "instructs" the barrister by delivering a "brief" to him. Solicitors also dispose of a vast amount of non-litigious business. Every solicitor must have been articled to a solicitor for at least three years, and must have passed the Solicitors' Examinations at the Law Institution in Chancery Lane, London, W. C.

**15. LOCAL GOVERNMENT.** As in other large and populous countries, the work of government in England\* is classified as being either

\* With England is included Wales and the Scilly Isles, but not Scotland or Ireland, which have entirely distinct systems of local government; as have also the Channel Isles and the Isle of Man. The differences are, however, greater in terminology and form than in substance.

national or local. This classification has no reference to the place in which the work is done or to the area benefited; in England at any rate, it is based in practice—whatever may have been its origin—exclusively on the systems upon which these two branches of public administration are organized and controlled. That part of the work of government which is undertaken by the national organization of the state, directed from its capital, and administered under the direct orders of its executive head or principal legislature is termed national government; and is, indeed, by historians, politicians, and citizens alike, often exclusively thought of as government. That part which is left to subordinate organizations, relating only to particular geographical areas within the state; and which is immediately directed by and responsible to authorities belonging to those areas, subject only to more or less supervision, help, and superior control by the national government, is termed local government. In England and Wales, even more than in most other countries, the choice of the particular functions of government to be thus left to local authorities, and the amount and kind of the supervision, help, and superior control exercised by the national government in respect to each of these functions, have been determined rather by historical antecedents than by any consistent or logical theory. The aggregate amount, variety and relative importance of local government has, during the past three-quarters of a century, steadily increased; until it has come in the United Kingdom, nearly to equal in magnitude (measured by the annual cost of administration) that of the national government itself. This increase has not been due to any transfer of services from the sphere of national to that of local government. Such few transfers as have occurred (like that of the prisons in 1877) have been actually in the other direction. The enormous development of English local government has been due, partly, to the great expansion of the cities, which need more government than rural districts, partly to the progressive demand for new and increased services such as schools and libraries, and partly to the tendency to transfer the administration of services of common use from the sphere of private to that of public—usually local—administration.

#### THE SERVICES ADMINISTERED BY LOCAL AUTHORITIES.

The government at present entrusted to local authorities in England and Wales may be divided into four great classes, which we may term respectively the collective organization of public services, the collective regulation of individual conduct, the collective provision for special classes of the community, and the collective taxation upon individual citizens by which the net cost of the whole of the local government work is met. It has been a consequence of the great development of local government during the past three-quarters of a century, and of the absence of any logical or deliberately thought out plan of organization, that this or any other systematic analysis of local government functions does not correspond exactly with any definite classification of local governing bodies. We must therefore describe separately function and structure.

The collective organization of public services, though later in its great development than some other branches, now make up the largest part of English local government.

1. *Protection.*—We have first the fundamental service of the protection of the individual citizen against aggression, for which there is, from one end of England to the other—not excluding even the most rural or the most desolate regions—a series of salaried, professional and highly organized local forces of preventive police. In marked contrast with the practice of most other European countries (and, indeed, with that of Ireland), these police forces, nearly 200 in number, are (with the exception of that for the metropolitan area) exclusively under the control of the respective local authorities, and are subject neither to orders from, nor to control by the national executive. They are (outside the metropolitan area) entirely appointed, controlled, and paid by particular local authorities; in municipal boroughs, the town councils by their "watch committees"; in counties, by what are known as "standing joint committees," of which half the members are chosen by the County Council and half by the Justices of the Peace in Quarter Sessions. The total cost of maintenance of the provincial police forces is about three and a half million pounds, and that of the two metropolitan forces two and a half million pounds per annum, for which nearly 50,000 men are maintained. A separate grant of part of this cost (at first a quarter, latterly one-half) was long made from the national exchequer, conditionally on the local authority (1) permitting the Home Secretary to have its force inspected annually by an officer appointed for the purpose, (2) maintaining it at such a standard of strength and efficiency as the Home Secretary might consider satisfactory. No separate police grant is now made, the amounts (aggregating over £3,000,000 per annum) having been merged in larger general contributions in aid of local authorities; but a certificate by the Home Secretary that the above conditions have been fulfilled is still annually required before payment is made. In the metropolitan district (which for this purpose extends to an area of more than 15 miles radius from Charing Cross) there are two police forces; one of small size, maintained by the Corporation of the City of London, without exchequer aid or Home Office inspection, for the protection of the one square mile of the old city; and the other the largest in the world, organized as a local force, but commanded without any shadow of local control, by officers appointed by the national executive itself (Home Office); at the cost, partly of a fixed local rate of six pence in the pound, which meets about half the expense, and partly of the national exchequer; for the protection of the 900 square miles of the metropolitan area. ('Annual Home Office Reports as to Police'; ('History of Police in England,' by W. L. M. Lee, 1902).

While the central courts of justice form part of the national government, some of the minor tribunals are (though the judges are never elective) supplied by local government, either in form of (a) petty criminal courts held by the local justices of the peace; (b) the more important Courts of Quarter Sessions, held by the same, (c) stipendiary police magis-

trates in various cities, appointed by the national executive, but paid for by the cities themselves; and (d) a few local civil courts maintained in the city of London and some other of the older cities. The stipendiary police magistrates in the metropolitan district (outside the old city) are maintained in the same way as the metropolitan police force. ('Justice and Police,' by F. W. Maitland).

Protection from fire is afforded by separately organized fire brigades, having no connection with the police. These are in all cases exclusively under the control of the local authorities; in London, the County Council; in the municipal boroughs, the Municipal Corporation; in other places, the Urban District Council, or the Parish Council. In London, the fire brigade is second in size and cost only to that of New York, and it is not clear whether, for the particular conditions of its task, its efficiency is second to that of any in the world. Its strength is nearly 1500 men, and its cost over a quarter of a million sterling annually toward which the fire insurance companies have to contribute a trifling percentage of the value they severally insure in London, and the national exchequer unconditionally contributes £10,000 a year in respect of the large amount of national property in the metropolis. Some of the provincial cities have also salaried professional fire brigades, often highly efficient. In less populous centres, according to the unfettered discretion of the particular local authority in each case, the fire protection passes by insensible gradations (some salaried professionals, men in other occupations partially paid for fire service, or unpaid but organized volunteers) down to the mere provision of a hand pump and buckets, to be used by any zealous citizen. Protection against fire in theatres and music halls, and against such methods of building houses generally as might facilitate dangerous fires, is afforded, in the metropolis, by the stringent regulations and inspection by the London County Council under its special building act. In other towns the Municipal Corporation takes such action of a similar kind as it thinks fit, by way of by-laws. Protection against drowning is afforded in the bathing season by the boats and boatmen provided by only a few seaside municipal corporations. The lighthouse service is maintained at national expense by the Trinity House, an ancient corporation, now essentially a branch of the national executive (Board of Trade).

**2. Locomotion.**—In so far as locomotion is not abandoned to private enterprise (railways, most river steamers, some tramways, omnibuses, etc.), the whole provision for this service is left in England to the local authorities. The maintenance of roads, now assisted by the national department styled the Road Board, is performed, over every part of England and Wales, by one kind of local governing body or another. Within London, it is the council of the particular metropolitan borough; in the municipal boroughs, it is the corporation; in other towns, it is the urban district council; and wherever none of these authorities exist, it is the rural district council which is responsible for this service. The method and standard adopted in each locality is left to the unfettered discretion of its local authority, which (for the 100,000 miles of by-roads) has itself to bear all the

expense. But for what are deemed main roads (apart from London and the principal cities which are called county boroughs), the county council either itself undertakes the service or else contributes to the minor local authority a sum agreed between them as the cost of keeping up such main roads, of which there are 30,000 miles. The average amount per mile annually spent on road maintenance is main roads £60; by-roads, £20; but these sums are largely increased in the growing mileage of roads now treated by preparations of tar so as to be adapted to the rubber tires of automobiles. The county council, outside London and the county boroughs, moreover, maintain the bridges over streams, etc., with some exceptions. Where, as in urban districts, the road becomes a street, its maintenance naturally becomes more costly, and altogether new needs of paving, cleansing, and lighting arise, to be dealt with and paid for in each case by the local authority concerned, at its unfettered discretion. Further developments of the same service, undertaken under special powers, are the short lengths of canal of the Exeter and York municipal corporations, and the extensive canal navigation owned and operated by the Gloucestershire county council; the harbors, piers, and docks maintained by the Port of London authority, the Mersey Docks and Harbors Board and about 60 other local authorities; the numerous bridges over the Thames, constructed and maintained partly by the Corporation of the City of London, partly by the London County Council; similar bridges over rivers in other cities nearly always maintained by the local municipal corporation; the great tunnels under the Thames constructed by the London County Council; a few old-fashioned ferry services maintained (as at Saltash, Middlesbrough, and Sunderland) by various local authorities; the development of the ferry into a moving "floating bridge" by the corporation of Southampton; and into river steamboat services across the Mersey by the Corporation of Birkenhead, and across the Thames at Woolwich by the London County Council. In other directions the road has been developed into a tramway; and cars—steam or electric—are now owned by more than a hundred local authorities, and operated under municipal management by an ever increasing number of them (in 1918 nearly 50), including the valuable miles of track worked by the London County Council, with gross receipts from fares which, in a normal year may be put at more than £2,000,000 sterling. In a number of cities the municipal corporation has obtained exceptional power to run an omnibus service in conjunction with the tramways. In all other cases the omnibus service is left to private enterprise. A few bridges constructed by groups of capitalists, with power to charge tolls, are still in the same position, as are most of the canals, and all the railways and coast steamboats. The 19th century saw a marked tendency toward freeing from toll the use of the various means of locomotion maintained by local authorities. Their roads and streets—once barred to all but pedestrians by tollgates—are now invariably free; the bridges, on many of which even pedestrians were charged a toll, are now (with the exception of a few capitalistic ventures, still in private hands) uniformly free; the tun-

nels under the Thames are free to vehicles as well as to pedestrians; the steamboat service by which the London County Council maintains the Woolwich ferry is equally free; while the tendency in the municipal tramway, canal and steamboat services is to charge only the smallest fares or tolls e.g. "halfpenny fares" for short stages.

**3. Water Supply.**—The supply of water is only in a steadily diminishing number of cities, of which the largest are Bristol and Newcastle, a matter for private enterprise. In 1600 boroughs and urban and rural districts this public service is in the hands of the local authority, usually the municipal corporation, or (as in the metropolitan district), of a council made up of representatives of different local authorities, the aggregate amount of capital invested in these public water enterprises being about £200,000,000 sterling. It is now generally thought to be a defect that there is no systematic distribution, among the great centres of population, of the natural water basins; and no provincial authorities entitled to control them.

**4. Heat, Light and Power.**—Gas for lighting, heating, and power is produced and supplied under the authority of separate statutes, in about 700 cities and towns, besides a number of smaller installations started without statutory powers. These gas works were, in their origin, mostly private enterprises (though the local governing body of Manchester started its own gas works in 1816), but there has been a steady tendency to municipalization, until more than 200 towns already govern their own gas production, with a capital of £50,000,000 sterling invested in their enterprises. During the last quarter of a century on an average five cities a year have municipalized their gas supply; and as these comprised a majority of the smaller consumers, about one-half of the entire number of the users of gas in the United Kingdom are thus co-operatively supplied by themselves as citizens (Annual Returns as to Gas Works, Board of Trade). Electricity, starting only within the past half century, has been even more predominantly a matter of municipal enterprise. Nearly 200 towns have their own municipal electricity supply, in which some £40,000,000 sterling is now invested. In Manchester the municipal corporation supplies also hydraulic power.

**5. Education.**—The extensive public service of education—as a function of local government scarcely a generation old—now makes up more than a fifth of the total expenditure of the local authorities. While the national executive, by contributing more than half of this expenditure on education, exercises great influence by means of the conditions which it attaches to its grants, the power of the local authorities to provide what kind and what amount of educational facilities they deem fit over and above the national minimum, is (so far as secular subjects are concerned) now practically unlimited. There is no limit to their current expenditure, or to the amount of rate they may levy. There is no limit of grade or of age. Anything that is education—whether elementary, secondary, or university in grade; whether infant or adult; whether literary, scientific, artistic, technological or professional in kind—the local authority may, if it chooses, provide, without requiring any sanction or ap-

proval, in whatever way it chooses, under whatever regulations it chooses, gratuitously or at any fee. It is legally restrained only (1) by the statutory exclusion (or only conditional admission) of religious instruction in the nature of a catechism distinctive of any particular denomination; (2) by the statutory obligation to provide at least the "national minimum" of efficient elementary schools for all children between 5 and 14 requiring elementary instruction; (3) by the need for sanction of any projects for raising funds by loans. In practice, the dislike of the citizens to an undue increase in the rates restrains the local authorities at present to a comparatively limited use of their vast powers. While elementary schools, of one sort or another,—now always compulsorily attended and, with trivial exceptions, absolutely free of charge—exist in adequate numbers, there is still an insufficient supply of secondary schools, apart from those maintained from ancient endowments, under separate governing bodies; and whilst, in most cities, much has been done for technological education of an elementary grade, the provision for university education and the higher technological instruction is, compared with the need, now recognized as inadequate. For everything above the elementary school, fees are charged. On the other hand, London has a "scholarship ladder" unequalled in extent and genuine accessibility anywhere in the world. By an unlimited provision of free places coupled with maintenance allowances, awarded on a merely qualifying examination, the opportunity for secondary and university education is effectively opened even to the poorest child of more than average ability. Nearly all other local authorities have less extensive scholarship schemes on similar lines. The result is that the percentage of the population enjoying secondary schooling is greater in London and various other English cities—notwithstanding the fee-paying system—than it is in Chicago or even in Boston.

**6. Miscellaneous Services.**—Brevity compels the grouping together of a large number of diverse public services organized and administered by local authorities. With the exception of a few ancient chartered rights in the hands of private owners (of which Covent Garden in London is by far the most important), the markets are in public ownership, involving a total capital of some £10,000,000 sterling, and (while a few are leased) usually under public administration; often including warehouse accommodation, weighing machines, sometimes cold-storage and abattoir. The municipal provision of workmen's blocks in towns and of cottages in the country has been carried on to a great extent, not only by the London County Council, which had already in 1916 over 30,000 people in its dwellings, but also by about 100 other authorities. (*The Housing Handbook*, by W. Thompson, 1904). The existence of a few "joint-stock" cemeteries serves to remind us that the provision and management of burial grounds is an important function of the local authorities, in which millions of capital is invested, extending in one or two cases (as at Hull), to the provision of crematoria. Interment is, however, the business of the undertaker, and remains everywhere in private hands; not even subjected, as is the case in some continental cities, to public con-

trol. The provision of parks and recreation grounds, with bands of music, gymnasia, facilities for games, etc., has been lavishly undertaken. Hundreds of cities and towns have free public libraries and reading rooms; others have also public picture galleries and museums which are uniformly free; while a couple of hundred places provide for their citizens swimming and other baths, and public laundries, at low fees. Among the other miscellaneous public services maintained by English local authorities are the Bradford "conditioning house," or wool-grading establishment, the Burnley municipal cold storage, the Doncaster race course, and various municipal supplies of sterilized milk. The tendency of local authorities to embark in these enterprises had led to a discussion of what is called "municipal trading," during which municipalization has proceeded at a greater rate than ever. (For the abstract case against this tendency, consult 'Municipal Trade,' by L. Darwin (1903); for an equally abstract defense, 'The Commonsense of Municipal Trading,' by G. Bernard Shaw (1904), and 'Mind Your Own Business,' by R. B. Suthers (1905); for statistics, 'The Municipal Yearbook' and 'The London Manual' (both annually); the seven volumes of 'Local Taxation Returns' annually published by the Local Government Board; and the periodical return of 'Reproductive Undertakings carried on by Municipal Boroughs,' also issued by that office.) In 1916 the amount of capital under municipal management cannot be put at less than £1,000,000,000 sterling; the aggregate municipal indebtedness (all repayable within 20 to 60 years), being over £600,000,000 sterling. Manchester and Birmingham have over £20 per head of population of capital under municipal management.

The part played by local government authorities in England in the collective regulation of individual conduct is less conspicuous than their organization of municipal services, but it is too important to be ignored. It is not merely that practically all these authorities exercise, in their power of making by-laws, a minor legislative function, on which we to a great extent depend for the prevention and suppression of nuisances, the regulation of the streets, all the ramifications of public health, and the operations of building and various noxious trades. If, as in England we must, we include among local authorities the justices of the peace, the regulation of the sale of alcoholic drink, the places where it may be sold, and to some slight extent the hours during which the sale may take place, fall within the discretion of local governing bodies. Finally, in the direction and control of all the provincial police forces, the local authorities have virtually extensive and scarcely defined opportunities of supervising and restraining any overt manifestations of individual conduct which is "disorderly in character," and of which local public opinion disapproves.

The collective provision for special classes of the community is one of the oldest and was, until lately, the most costly of the functions of local government in England. Under the comprehensive term of the Poor Law there is now included a whole array of specialized provisions for orphan and deserted children, for the sick, for persons of unsound mind, for physical and mental "defectives," for the aged and infirm, and for the men and women who be-

come destitute, together with their children. The total amount spent on this service is about £15,000,000 sterling annually. Beyond the ancient limits of the Poor Law, and still within the sphere of local government, we have, in addition, the provision of hospitals for lunatics, idiots, and epileptics; the costly arrangements for maintaining and medically treating those suffering from any infectious disease; and the organized provision now made for the temporarily unemployed—making an aggregate annual expenditure from public funds on the care of particularly distressed or afflicted classes of the community, falling not far short (apart from education) of £30,000,000 sterling.

The taxation by which the local authorities maintain all these services (apart from the revenue of municipal property, the receipts from municipal services and contributions from the national exchequer), is levied entirely by themselves. They cannot create a new tax, but once the kind of impost is authorized by Parliament, the rate at which the citizen shall be charged is, as a rule, left to the unrestrained discretion of the local governing body. In amount, there is no limit to its taxing power. Of the total gross revenues of the English local authorities (apart from loans), which may roughly be put at about £150,000,000 sterling, about £30,000,000 is received from the national exchequer, leaving some £120,000,000 to be raised locally. Of this nearly £30,000,000 is derived from the receipts from the various municipal enterprises that we have described, £5,000,000 from other municipal property, £2,000,000 from fines and fees, and £5,000,000 in reimbursements and miscellaneous receipts, leaving about £78,000,000 to be raised by local taxation. Tolls and dues (apart from those connected with markets and harbors) yield less than a million. The whole of the balance is found by one tax, the so-called "rate," a periodical levy, upon the occupiers of the real estate within the area of each local authority, of a specified proportionate part of the assessed annual value of that real estate. This universal impost, known as the Local Rate (sometimes as the Poor Rate, the District Rate, the Police Rate, etc.), varies widely from place to place, but is most commonly between two and eight shillings in the pound, or between 10 and 40 per cent of the annual rental. The actual average for all purposes, including both urban and rural areas, is usually about four shillings in the pound, equivalent to an annual levy on the capital value of the real estate of about one per cent, and to an annual contribution per head of population of about a couple of pounds. It is an interesting and little known statistical fact that the amount of this local taxation per head is only about the same as it was a century ago. This local tax is legally payable by the occupier of every house or farm, or other separate holding of real estate, who (if, as is commonly the case, he is not himself the owner), is left to make his own contractual relation with the owner or "landlord"; normally the occupier pays the rates in addition to his rent. But in "flats" forming part of large blocks, and in property of small annual value, especially that let by the week, the owner usually "compounds" with the local authority, in consideration of a discount to pay the rates himself instead of throwing the burden on the occupier (the so-called "compound house-

holder"), whose rent then includes both rent and rates.

#### LOCAL GOVERNING BODIES.

English local government is everywhere, and for all purposes, carried on by one particular form of political machinery, which to the Englishman seems so inevitable that he seldom thinks of describing it. The powers and duties of government are vested, not in any officers personally, but in a board or council of members, having jurisdiction, for specific branches of administration, over a definite area. This governing body, which is uniformly unpaid and composed of citizens more or less engaged in their own avocations, appoints, supervises and directs a staff of salaried, professional officers (the "municipal civil service"), by whom the actual functions are performed. The staff of salaried officers is invariably appointed by the governing body; and (though service is nominally only during pleasure), the appointments are habitually permanent, terminable only on death, retirement through ill-health, superannuation or misconduct. There is no such thing in English local government as removal for political reasons, or in order to make a vacancy. The board or council acts collectively, by resolutions agreed to at its meetings by a majority of the members present. Its deliberations are presided over by one of its own number, called chairman or mayor, whom it freely elects; and not by a person separately elected by the people for the presidential position, or appointed to it by some outside authority. Perhaps for this reason, it is a distinctive feature in English local governing bodies that the presiding member has but little personal power or responsibility, apart from presiding. Though in practice he often exercises out of sessions, some executive power, by giving orders to the salaried staff, this is always done in the name of the board or council, and subject to its ratification. The board or council habitually divides itself into committees, each charged with the supervision of a particular branch of the government, and required to report to the main body. The result is an intimate combination of legislative, executive, and occasionally even judicial operations, which the Englishman takes for granted as "administration." It may be added that national politics have little influence on local government. The salaried staff is almost universally "out of politics." In many cases, perhaps the majority, the elections are not contested on political grounds, or seriously fought by the political organizations. In London and many of the large boroughs, the elections are thus fought, but the issues are not primarily those of national politics, nor is the cleavage of opinion exactly the same. And once elected, the members (even where the contests have been keen) seldom habitually allow their politics or party divisions to affect their municipal administration.

The organization of local government in England, once extremely complicated, has been much simplified by recent statutes. The era of reform began, indeed, in 1834-35, when the ancient municipal corporations were made elective and systematized, and the Poor Law was placed in the hands of elective Boards of Guardians. Between 1848 and 1873, a system of elective rural and urban district councils was

created principally for sanitation and roads. In 1888, the county councils were established on an elective basis, to take over from the non-elective justices of the peace the civil administration of the counties. In 1894, the rural parishes were provided with elective parish councils; and in 1900 the different parts of London with metropolitan borough councils. By these successive statutes every part of England and Wales has been placed under local governing bodies annually or triennially elected on the widest possible residential qualification, women having a vote whenever they are independent householders, and being everywhere eligible for election. There is, speaking broadly, no property qualification for election, and (unlike the English parliamentary ballottings) no obligation on the candidate to provide the election expenses. The members of the local governing bodies receive no salary or other remuneration for their work. Only very exceptionally, in positions such as the mayoralty of an important city, is any allowance paid even for expenses.

In spite of simplifying statutes, English local government is still shared among various strata of different authorities, constituted for different purposes under different statutes. The county of London, with 4,750,000 of inhabitants, has a local government of its own, and must be considered apart. We take first the network of local authorities administering the more obvious services of municipal government, including sanitation and education. To begin with the parish, we see this ancient ecclesiastical area in the rural districts forming the lowest unit of government; administered, if small, by the parish meeting open to all adults; if large, by a parish council triennially elected by the householders. The parish meeting or parish council may light the village, protect the footpaths and village green, establish libraries and reading rooms, baths and public laundries; but its power to tax is limited. Next to it stands the rural district council, dealing with roads and sanitation, triennially elected by and acting for the householders of a group of parishes. Places in which the population has become aggregated together, needing greater and more varied local government services, are (by Local Government Board order) given the status of urban districts. The householders of these urban areas elect an urban district council, which combines the functions of the parish council and the rural district council, with greatly extended powers. A steadily increasing number of urban districts (now over 300 in number) have, sometimes because of past historical importance, sometimes because of present populousness, been given by the Crown (nowadays the Privy Council) the status of chartered municipal corporations; these elect their councils annually by thirds instead of triennially; their councils elect to preside over them, not a chairman but a mayor; and they co-opt into their own bodies additional members styled aldermen. Such of them as have any considerable population (about 130 in number), have their own police forces, under the control of their own town councils. Apart from minor technicalities there is practically no other difference between an urban district which is, and one which is not, a municipal corporation. The words "town" and "borough," it may be men-

tioned, are used in England, for any urban place, irrespective of size. The word "city" is of equally lax usage, but it ought to be restricted to those towns, large or small, which have been specifically termed or created cities by statute or royal enactment, together with some others, usually the seats of bishoprics, which bear it by old usage. Above all these bodies stands the county council; elected triennially by the occupiers of houses or lands within the county, whether residing in rural parishes, urban districts or municipal corporations. The county council is the authority for education; it provides the public lunatic asylums; it either pays for or itself maintains the main roads; it administers various minor services for the county as a whole; and it exercises a certain amount of supervision and criticism and some slight control over the minor local authorities. It contributes half the members (the justices of the peace nominating the other half) to the standing joint committee, which controls the county police force.

Most of the boroughs over 50,000 inhabitants (and some ancient towns below that population) stand outside the area of the administrative county, and are neither represented in nor controlled by the county council. These, the so-called county boroughs (now just 75 in number) are entirely autonomous municipal corporations, which have, in addition, the powers of county councils. The town council, elected in the same manner as that of other municipal corporations, and presided over by a mayor (or in 12 of the larger cities a lord mayor) is (apart from the administration of justice and of the Poor Law) the sole local governing authority of the city, with practically unlimited autonomy within the scope of the statutory authority entrusted by Parliament to local authorities generally; and except in a few cases, not even subject, as regards its expenditure on all but one or two subjects, to the general Local Government Board audit. It is an important feature of these county boroughs that they (like the other municipal corporations of any size) mostly have their own police forces, exclusively under the control of their own town councils (by the "watch committee").

The 4,750,000 persons who inhabit the county of London have a more complex local government than the citizens of Liverpool or Manchester. London is divided into 29 metropolitan boroughs, one of them being the ancient city, preserving still its Corporation, its lord mayor, and other dignitaries and various other peculiarities. These metropolitan boroughs have each a council, elected triennially by the householders, which independently administers the paving, cleansing and lighting of the streets, the minor house drainage, the removal of refuse, the suppression of nuisances and the collection of all the municipal taxes. The City Corporation, in addition, manages, with its own considerable estates, the central markets, some of the bridges and the special city police force. Above these local bodies stands the London County Council, with annual receipts and expenditures exceeding £12,000,000 sterling, with 118 members elected triennially by the householders of the whole administrative county of London, together with 19 co-opted aldermen; and responsible for education, main drainage, parks and recreation grounds, the lunatic asylums, the

tramway service, the ferry steamboats, the great street improvements, the demolition of "slum" areas and the erection of new dwellings, the administration of the stringent Building Act and a host of miscellaneous county services, together with the management of the debt of London, not only for its own needs, but also for those of the other local bodies (except the City Corporation). The water supply of the whole metropolitan district, extending to much more than the county area, is in the hands of the Metropolitan Water Board, a body made up of representatives of all the local authorities concerned. The port and river in the hands of the Port of London Authority is constituted in a similar manner. The upper Thames is administered by the Thames Conservancy Board, a body of 28 members, appointed by the Corporation, the Water Board, the County Council and the Board of Trade.

The foregoing survey of English local government omits two branches, which, from historical causes, still retain their separate organizations. Nearly the whole of the collective provision for special classes (but not that for lunatics, nor that for persons suffering from infectious diseases) is in the hands of what are called the Poor Law authorities. The country is for this purpose divided into 653 unions of parishes, often not corresponding with the boundaries of urban districts, municipal corporations, county boroughs or counties. The householders of each of these unions elect either annually or triennially, a board of guardians, which administers the public provision for the aged and infirm, the orphan and deserted children, the indigent sick, the tramps or vagrants, and the destitute of every kind. These boards of guardians levy, for the cost of their schools, infirmaries, work-houses and "outdoor relief," an unlimited tax on householders, the celebrated poor rate. They have complete discretion as to the amount of money that they will spend, and as to the amount of the relief that they will afford (above the legal "national minimum" of preventing death by starvation); but their discretion as to the mode of relief, as to the erection of buildings, as to the appointment of officers, and as to the raising of loans is guided, and, in the last resort, controlled, by the Local Government Board, which has (in this branch of local government more than any other) the power of issuing peremptory orders having the force of law. In London, where there are about 30 boards of guardians, these have also a joint body, the Metropolitan Asylums Board, made up chiefly of their nominees, which manages the infectious disease hospitals and the asylums for idiots.

The other important branch of local government with an organization of its own, and the only one not upon an elective basis, is that of the Justices of the Peace. These are gentlemen of position (now frequently including trade union officials and other prominent workmen) who are individually appointed by the Crown (the Lord Chancellor), by being included in what is termed the Commission of the Peace. In practice, however, they are almost always chosen by the Lord Lieutenant of the county, who, in most counties, defers informally to the wishes of the existing justices and is now aided by an advisory committee of justices.

Thus, the "County Benches" are, in effect, recruited to a great extent by an informal system of co-optation. The principal function of the justices is that of acting as magistrates. Any one justice can issue summonses to appear and warrants to the police for the apprehension of offenders; any two within each county can hold a petty criminal court ("Petty Sessions"), with power to inflict sentences of fine and short terms of imprisonment (subject to appeal to Quarter Sessions), or to commit to prison pending trial at a higher court; and once a quarter, the meeting of justices in "Quarter Sessions" forms a criminal court trying, with a jury, all but the most serious crimes, such as murder and grave felonies. At Divisional Sessions, the justices license retailers of alcoholic drink, nominally at their discretion, but really without effective powers of refusing the renewal of existing licenses, except for grave misconduct. A recent statute enables them to award compensation, charged by a special rate on the district concerned, to the holders of licenses which they withdraw merely on the ground that they are unnecessary. Finally, the Justices in Quarter Sessions, by nominating half the members of the standing joint committee (the County Council sending the other half) go far to control the county police force. It should be said that a slight elective element is infused into the County Benches by the fact that the chairmen of the urban district councils are *ex officio* justices. The county boroughs, and also most of the smaller municipalities, have commissions of the peace separate from those of the counties, and the Justices of the Peace so appointed usually comprise the mayor for the time being, and some leading members of the town council. They have the same judicial and licensing powers (though no control over the borough police force); but in most towns of any size they perform few judicial duties. In many towns there is also a stipendiary professional police magistrate, appointed by the Crown (Home Office) at the request and at the expense of the town council, who relieves the justices of the police court work. In towns having their own Court of Quarter Sessions, the duties of judge are performed by the recorder, also appointed by the Crown (Lord Chancellor), who is always a barrister of position, merely visiting the town for the purpose of holding the quarterly court, and receiving for this duty a small annual stipend.

There remain to be mentioned certain local authorities standing outside the general system. Mention has already been made of the Port of London Authority. At Liverpool and some other ports the port is managed by a harbor trust or board, usually elected by the payers of dock or port dues, including the shipowners, with more or less representation of other local governing bodies. The Mersey Docks and Harbor Board, as the Liverpool port authority is called, administers a series of docks representing a capital outlay of some £30,000,000 sterling. Besides the Metropolitan Water Board, there are a few other special water authorities. There are also a few federal bodies, made up of contiguous local authorities for the joint management of water, drainage, asylums or hospitals. In low-lying or marsh districts there are 300 ancient bodies called commissioners of sewers,

appointed in form by the Crown (Lord Chancellor), but practically renewing themselves by co-optation. These bodies maintain the seawalls, sluices and embankments, enforcing on the neighboring landowners their obligations of tenure, and levying on them the cost of necessary common works. The most exceptional of these authorities is that of Romney Marsh, in Kent, where the owners for the time being of 23 ancient estates are, by themselves or their deputies, "Lords of the Level," with extensive taxing and judicial powers for the maintenance of the great seawall.

#### RELATION BETWEEN LOCAL AUTHORITIES AND THE NATIONAL EXECUTIVE.

In the matter of the relation between the national executive and the authorities administering the various services of local government, England occupies a position intermediate between that of France on the one hand, and the New England or Western States of the United States on the other. The very real autonomy of the English local governing body — greatest in the County Borough, or in such bodies as the Mersey Docks and Harbor Board or the Commissioners of Sewers of Romney Marsh, and least in the Boards of Guardians — marks it off from any analogous authority in continental Europe. The English local authority for each area is formed without any intervention of the national executive (except in the cases of the Justices of the Peace and the ordinary commissioners of sewers, and then mainly in form only), and entirely independently of its volition. It is, for the most part, not subject to the orders of any part of the national executive; it has, in nearly every case, real and complete discretion as to the manner in which its services shall be rendered or the law of the land carried out; it can, for the most part, determine whether or not a particular service shall be supplied in its locality; in all cases it decides on its own responsibility upon its own budget of expenditure, and (whilst not able to impose a new kind of tax) as to the rate of the taxation — of the kind prescribed by statute — which it will levy upon its constituency; and while in particular instances it is required to obtain the approval of the national executive, either for its projects or to its actual administration, its practical independence is such that a stubborn local authority usually gets very nearly its own way. To an Englishman it is almost inconceivable that a local authority should be appointed, wholly or in part, by the national executive (unless merely in form) — though the Crown nominates a few members to such bodies as the Port of London Authority and the Mersey Docks and Harbor Board, while the Local Government Board nominates members to, and exercises a real control over, the very anomalous Metropolitan Asylums Board — that it should receive and obey orders from the Minister of the Interior; or that it should have to submit its budget for the approval of any superior. On the other hand, no local authority in England — whatever the case may have been in times past — has any original, inherent, or independent powers. With the possible exception of the ancient corporation of the City of London, all the English local authorities of to-day plainly owe their origin to

and derive their governmental powers exclusively from the statutes which Parliament has enacted concerning them; and they are, without exception, in all cases, subject to the conditions and limitations of those and any new statutes. A local governing body has, in England and Wales, no rights, powers, privileges or duties inherent in it merely because it is representative of the people of the particular locality; or secured to it by a constitution or other authority independent of the national legislature for the time being. Nor is there in England anything corresponding to the complete separation between the state executive and the local authorities and their mutual independence of each other that characterizes so many of the States of America. Every local authority in England is required by law at least to furnish an annual statement of its accounts to the Local Government Board; nearly all of them have to obtain the approval of that branch of the national executive before incurring expenditure to be met out of borrowed money, and before raising a loan; most of them receive annual grants from the national exchequer in aid of their expenditure on particular local services, and have therefore to comply with the conditions that may be attached to these grants by the Treasury, the Board of Education, the Home Office, the Board of Agriculture or the Local Government Board; finally, nearly all of them have to submit—but the municipal corporations only in respect of part of their work—to an annual audit of their accounts by auditors appointed by and responsible to the Local Government Board. These auditors do not carry out, however, the wishes of the national executive; what they have to do is to prevent disobedience to the statutes of the national legislature. They have, in fact, to act in a judicial rather than in an executive capacity, having no power to override a mere exercise of the discretion of the local authority, but they are authorized, and indeed required, whatever the Local Government Board, or other executive authority might desire, subject to appeal to the ordinary courts of law, peremptorily to disallow and to cause to be refunded, any expenditure that (whether in respect of its subject matter, or by reason of fraud, embezzlement or mere waste) falls outside the statutory powers conferred upon the local authority. It should, moreover, be added that any difference of opinion between the Local Government Board (or other branch of the national executive) and a local authority, or between two local authorities, as to their respective legal powers and obligations, has to be determined (unless by mutual consent) not by the decision of any executive officer or by the national executive itself—not even by any special tribunal which the national executive might influence—but, as in the United States, by the ordinary courts of justice, applying to the dispute the ordinary law of the land, exactly as if it were a dispute between private individuals. In the same way, when a local authority disobeys or fails to comply with any of the statutes, or acts in excess of its powers, it can be coerced to obedience (apart from such disallowance of unlawful expenditure by the auditor, or such withdrawal of financial assistance from the national exchequer as has been already mentioned) only by means of actions in

the ordinary courts of justice, which have to be initiated either by aggrieved individuals or by the national executive under the ordinary law.

But any description of the relation between the national executive and the local governing bodies in England would miss the most important feature if it omitted to lay stress on the Grant in Aid. It is the system of grants in aid from the national exchequer upon which the smooth and efficient working of the whole organization to a large extent depends. The expressed purposes of these grants in aid are (a) to assist poor localities, and prevent the local rates rising to an oppressive height, by promoting a partial equalization of burden; and (b) to induce apathetic or backward local authorities to incur expenditure on local services in which the community as a whole has a strong interest. Even more important to the student of political science is the utility of these national subventions to local government, when given in their most efficient form, in securing national efficiency, without destruction of genuine local autonomy. The basis of English local government is the statutory enactment, by the national legislature, of a minimum standard in each public service (notably in sanitation, education and police), the attainment of which is legally obligatory on every local authority, and is legally enforceable by mandamus. Beyond that national minimum in each public service, each local authority has complete discretion. It can, at the expense of its ever-rising local rates, and subject to the control implied in periodical popular election, do as much or as little as it chooses. But if it chooses to comply with certain specified conditions imposed by the national executive—conditions designed to secure a constantly rising standard of efficiency in particular services—it can (especially in education) obtain national grants in aid of its local expenditure, so calculated as to share the financial burden of increased efficiency between the national exchequer and the local rates. The position of authoritative criticism and ultimate power to withhold the grant, which this relation gives to the national executive—while leaving the local authority both freedom of decision and a genuine choice among methods, as well as complete autonomy in the appointment of officers—appears, on the whole, the best possible device for combining administrative efficiency with local popular control.

**Bibliography.**—Besides the authorities cited in the text the student should consult 'English Local Government,' by Dr. Joseph Redlich and F. W. Hirst; or 'The Parish and the County,' by Sidney and Beatrice Webb (1906); 'The Manor and the Borough' (1908); 'The Story of the King's Highway' (1913) and 'Grants in Aid' (1911), forming an analytic and historical account of English local government. Brief descriptions of the actual organization of to-day are 'Local Government,' by Percy Ashley (1905); and 'Local Government,' by Dr. Blake Odgers (1902).

Joint authors of 'The History of Trade Unionism,' 'Industrial Democracy,' etc.

**16. THE CIVIL SERVICE.** The present organization of the English Civil Service may be said to have originated in the appointment

by Order in Council in 1855 of a Civil Service Commission sufficiently strong and independent to check in some degree the then existing abuses of Parliamentary patronage.

In the earlier years of the reign of George III the king had kept patronage in his own hands, and had used it with the single view of increasing his personal power. Edmund Burke's reform of the Civil List (1782) brought in a new and more permanent organization of the government offices, which made royal pressure on the "placemen" more difficult. In 1809 a Superannuation Act had the practical effect of giving civil servants the right to hold their office during good behavior. From 1810 they were paid by salary instead of by fees, and from 1816 the salaries of many posts were provided by a Parliamentary grant. By this time the royal power was exercised by the cabinet ministers, and they, through the "Patronage Secretary to the Treasury," who acted (and still acts) as Parliamentary "whip," avowedly used their patronage on the nomination of individual members of Parliament as a means of keeping together a majority in the House of Commons. Lord John Russell, in his 'History of English Government and Constitution' 1823 (page 402), speaks of Parliamentary patronage as being "of late years more completely organized."

The legislation which followed the Reform Bill of 1832 increased the number and importance of civil service posts, while the growth of the railway system and of other forms of joint stock enterprise made it more difficult for the government to retain its few really able officials. The majority of the persons appointed on the nomination of ministers and members of Parliament were notoriously incompetent. Each party respected the appointments of its predecessor and no one lost his post on a change of government—a fact which, while it mitigated the evils of the spoils system, added to the permanent inefficiency of the service. Occasionally a strong man (like Sir James Stephen, 1789–1859, or Herman Merivale, 1806–1874), was appointed from outside in middle age for special work, but as a rule men were appointed young and were employed for their first 10 or 15 years in copying letters and other routine occupations. The effect on the personnel of the offices is described by Sir Charles Trevelyan and Sir Stafford Northcote (Report on the Civil Service, 1854): "Admission into the civil service is indeed eagerly sought after, but it is for the unambitious and the indolent or incapable that it is chiefly desired. Those whose abilities do not warrant an expectation that they will succeed in the open professions, where they must encounter the competition of their contemporaries, and those whom indolence of temperament or physical infirmities unfit for active exertion, are placed in the civil service."

The effect on the constituencies was even worse. Sir Charles Trevelyan, writing many years later, says: "Every borough and county except a few of the largest had its local manager, on either side—a banker, brewer or solicitor—who purchased the vote and support of the leading men by a judicious application of the loaves and fishes. The corruption so engendered was more constant and general than the bribery carried on by means of money, and

it was also more influential, in the degree in which a provision for life for a son or some other person in whom a voter was interested was more valuable than the customary five-pound note." (Eaton, 'Civil Service in Great Britain,' p. 431).

In 1853 the government appointed Sir Charles Trevelyan, with the late Sir Stafford Northcote (afterward Lord Iddesleigh) as his colleague, to inquire into the whole question. Trevelyan had been (1826–38) in the service of the East India Company and was the brother-in-law of Macaulay, who had been (1832–34) secretary to the India Board of Control and (1834–38) legal member of the Governor-General's Council. In 1833 Macaulay had suggested open competition for the "writerships" of the East India Company as the only effective method of controlling the patronage of the directors.

The Government of India Bill of 1853 carried this proposal into effect, the first open examination being held by the India Board in 1855.

Trevelyan and Northcote's report was presented in January 1854, and proposed open competition for the English civil service, and the separation of the service into higher and lower divisions. Gladstone, as Chancellor of the Exchequer in Lord Aberdeen's government, agreed with the scheme, and civil service reform was promised in the Queen's speech of 1854. Meanwhile the report had been sent round to a number of distinguished educators and administrators whose opinions, mostly pessimistic, were published by the government (Reports and Papers, 1854–55). In March 1854 the Crimean War began, which prevented any large reform being undertaken and the scheme was denounced in the House of Lords, by Lord Malmesbury and others, 13 March 1854, as inconsistent with aristocratic government. Resolutions in the House of Commons in favor of open competition were lost (10 July 1855) and carried 24 April 1856, and in 1857.

In 1860 a strong select committee inquired into the whole question and reported that their own preference was in favor of open competition, but that in order that the government should not go beyond public opinion they recommended the extension of this system of "limited competition" to the civil service generally. The evidence taken by the committee showed that some of the older civil servants still objected to the examination system, even under the conditions which had prevailed since 1855, on the ground that it had introduced "a class of men above their work."

The recommendations of the Select Committee were accepted by the government, and for the next 10 years a competition between at least three nominated candidates took place for each appointment.

The introduction of household suffrage in towns by Disraeli's "Leap in the Dark" Reform Bill (1867) and the defeat of the Conservative party at the election of 1868, altered the whole political position of the civil service question. The existing aristocratic political families felt that their hold on patronage was gone, and were afraid of the results which would follow from the use of patronage by members of Parliament under the pressure of

the newly enfranchised voters. The system of open competition for the Indian civil service introduced 15 years before had worked well, and Gladstone was able to publish (4 June 1870), almost without opposition, an Order in Council throwing open to competition most of the government offices. The Foreign Office and the Home Office (which controls the police) were excepted, owing to a belief that secrecy was better secured by a system of nomination. A few years later (1873) the Home Office was thrown open.

When the post-office took over the telegraphs from the railway companies in 1870 it was found that a few women officials were at work. These were retained, and since then the number of women civil servants has been increased.

Gladstone's Order in Council of 1870 still in essentials regulates admission to the English Civil Service, though alterations of name have occurred, such as the substitution of "Second Division" for "Lower Division" in 1890, and changes of salary, status, and examination subjects.

The system has been worked with a certain amount of elasticity. Men of all ages are from time to time appointed without competition to posts involving special knowledge, and competitive examination is never used in such cases as a test of qualifications. In some cases, as in the starting by the Liberal government of 1892-95 of the Labor Department of the Board of Trade and the Inquiries Department of the Board of Education, appointments have been given without examination to men from outside, although the work to be done is similar to that done elsewhere by civil servants recruited in the ordinary way. Inspectors are practically never appointed by examination, and the "Examiners" of the Board of Education, whose work is practically that of the "first division clerks" in other offices, are appointed by the president of the Board, generally from men who have just distinguished themselves at Oxford or Cambridge. Artisans at the royal dockyards and on other government work are appointed without competitive examination from lists of waiting applicants, and the same method is used for recruiting the police of London (which is under the central government). The younger "second division clerks" are allowed to compete on equal (or slightly more favorable) terms with the outside candidates for first division clerkships, but in no case is competitive examination used as the method of selection for promotion within the service.

Speaking generally it may be said that the English government believes that competitive examination in the ordinary subjects of study is an excellent way of selecting young men for employment at the end of their school or university career, whether at 17 or at 22 years of age, but that it is not effective when applied to men engaged in professional work or as a test of professional knowledge. The fact however that the main body of the officials are appointed by competition has produced an *esprit de corps* which keeps the whole service out of politics, and the exceptional cases of appointment by nomination neither excite nor as a rule deserve criticism.

In 1855 and in 1870 almost all young Englishmen of the well-to-do classes who did not

enter the army or navy went through the same course of education in classics and mathematics at the old endowed "public schools" and the two great universities. Professional preparation for the young "gentlemen" followed graduation, and therefore it was very easy immediately after graduation to compare their abilities and acquisitions by examination. Those who failed began, without feeling that they had wasted either time or effort, preparation for the Bar or the Church or the "public school" teaching profession, or more often started their professional work with little or no preparation. In the same way an examination for the lower civil service confined to reading, writing, and arithmetic, corresponded to the facts of the time, for few boys who did not go through the public school course learnt much else. Since 1870 the number of "secondary" and "higher grade" schools with a fairly wide curriculum has enormously increased. In 1898 it was found that the old narrow examination for the lower division had become by the mere force of competition a difficult and technical test for which boys left their schools and prepared themselves at crammers. A wider curriculum including modern languages and science was therefore substituted. This fact and the facilities in London and other cities for obtaining higher education in evening classes is tending to lessen the educational advantages possessed by the average first division clerk over a clever and ambitious second division clerk, and to break down the original reason for their life-long difference of status.

Burke in his reform of 1782 not only helped to create the class of professional "civil servants" but attempted to distribute some of their work upon a more logical and economical basis. What we now call "Government Departments" consisted then of the clerical staff attached, either to certain ancient offices of State, such as those of the Lord Chancellor, the Chancellor of the Exchequer, the Postmaster General, and the Secretaries of State, or to Committees of the Privy Council, or to Boards of Commissioners administering other ancient offices such as those of the Lord High Treasurer, or the Lord High Admiral. Each office had "grown" of itself, and new offices had been created as work increased and without reference to any consistent plan. Of the two principal Secretaries of State, for instance, the Secretary of the North conducted all correspondence with the Northern powers of Europe, and the Secretary for the South not only corresponded with France, Spain, etc., but carried on Irish business and the whole police and other work of the "Home" Department. Burke re-divided their duties, making the Northern Department the office of the Foreign Secretary, and the Southern Department that of the Home Secretary. At the same time, England having lost the greater part of her Empire, he suppressed the Colonial Secretary, who had existed since 1768, and who had by hopelessly unworkable arrangement shared his duties with a Committee of the Privy Council called the Board of Trade and Plantations. The work of both was given to the Home Secretary.

But it was not until the period of legislative activity which followed the Reform Bill of 1832 that anything like a complete survey

was made of the functions of government, or that any serious attempt was undertaken to create a department for each function. Both the recognition of the need of such a survey and the actual form taken by the redistribution of powers were largely influenced by the suggestions of Jeremy Bentham in his 'Constitutional Code' and other writings.

The Board of Works (Bentham's 'Domain Minister') was created in 1832; the Poor Law Commission (Bentham's 'Indigence Relief Minister') was created in 1834, became the Poor Law Board in 1847, and was merged in the Local Government Board in 1871; the Committee of Council for Education (Bentham's 'Education Minister') was created in 1839 and became the Board of Education in 1879; and the Registrar General (to superintend Bentham's 'Local Registrars' of vital statistics) was created in 1837. Separate Secretaries of State were appointed for War and Colonies in 1854, and for India in 1858. A Secretary for Scotland was created in 1885, and a Board of Agriculture in 1889.

At the time of his coronation King Edward VII created the *Imperial Service Order*, with the object of recognizing "more fully . . . the faithful and meritorious services rendered to us by members of the Civil Service of the various parts of our Empire." Recipients of the decoration bear the letters 'I. S. O.' after their names. Within recent years the government have introduced a number of salutary reforms into the complex organization of the Civil Service. New and improved schemes of examination took effect in 1900, 1902 and 1912. A significant change made during 1908 consisted in the grouping of a number of important offices under a scheme of examination intermediate in character between the test for Class I clerks and that for the second division. This plan had been adopted tentatively for junior appointments under the Admiralty and the War Office, but is now applied to several other offices and is still being further extended. In 1910 all previous orders relating to admission and conditions of service were repealed; such provisions as were then in force were re-enacted with amendments. Power was given to the Civil Service Commissioners, with approval of the Treasury, to prescribe the subjects of examination, limits of age, etc., for second division clerks. Compulsory retirement at the age of 65 was made applicable to all Civil Servants. A Royal Commission was appointed in 1912 to overhaul the whole institution, including the diplomatic and consular services. After an exhaustive inquiry the Commission published its report in April 1914. One of the suggestions was the creation of two classes in the General Service—the Administrative and the Clerical. The former would practically coincide with the present Class I clerks. The Clerical Class would be divided into senior and junior sections with salaries of \$425 to \$1,750 and \$250 to \$1,000 respectively. It is possible for a competition candidate to rise to \$12,000 a year. A review of the general results of the competitions which were held from 1870 to 1913 inclusive, shows that 46 competitions took place for an aggregate number of 692 clerkships, exclusive of Assistant-Surveyorships of Taxes. In the 1914 examination Oxford and Cambridge

University men secured between them 19 of the 20 posts available in the Home Service, and 42 of the 53 Indian posts. The candidate obtaining the highest marks—3,876 out of the 6,000 possible—was a student at Rugby School and Trinity College, Cambridge. The Civil Service Estimates (expenditure) for 1918-19 amounted to \$320,148,590 for England, Scotland, Ireland and Wales. This also included the Diplomatic and Consular Services, Old Age Pensions, Labor Exchanges, unemployment insurance, education, museums, art galleries, law officers, police, prisons, telegraphs and Pacific cables.

**Bibliography.**—The only book on the whole subject is D. B. Eaton's 'English Civil Service' (1880), a careful record of facts, but written without special knowledge of English conditions. The rise of the Indian civil service is admirably treated in A. L. Lowell's 'Colonial Civil Service' (1900). But the main sources are the reports and evidence of the successive Parliamentary committees and royal commissions which have sat on the subject, especially the Report of Sir Stafford Northcote and Sir Charles Trevelyan (1854), Reports and Papers on the reorganization of the Civil Service (1854-55), The Select Committee on the Civil Service (1860), The Playfair Commission (1874), and the Ridley Commission (1887). For the organization of government departments, consult Sir William Anson's 'Law and Custom of the Constitution,' Vol. II.

**17. SCOTTISH HISTORY.** From the Invasion of Agricola in 80 A.D. to the Death of Alexander III in 1286.—In the main lines of its development Scotland has from the beginning been subjected to the same general influences that have determined the civilization of all the countries of Western Christendom. Like each of these countries, however, it has had a history of its own which has given a specific stamp to the character of its people, to its institutions, laws, customs and social arrangements. Among the nations of Europe Scotland has an individuality as distinctive as that of any of its more powerful neighbors, and it has made its own contribution to the general sum of knowledge and to the advancement of humanity.

Remote as is her geographical position, Scotland, from the moment it appears in history, was an integral part of Western Europe. Like England, France and other countries she also came under the domination of the Roman Empire, and her history begins with the invasion of Agricola in the year 80 A.D. In her case, however (and it is a note of difference at the very beginning of her history), the Roman dominion never passed beyond a military occupation, and, except material remains, left no permanent impression of its presence. The next powerful influence that helped to determine the future of Europe was the spread of Christianity, and for this influence Scotland had not long to wait. About the year 563 Saint Columba introduced Irish Christianity into the country north of the River Forth, and by the first

quarter of the 8th century the whole of North Britain came nominally under the jurisdiction of the Bishop of Rome. Christianity was a common factor in the process which led to the formation of the nations of Western Europe, but in Scotland, as in other countries, there were specific conditions that determined the character of her development and permanently influenced the genius of her people. There was first the physical nature of the country, and, second, the fact that peoples speaking different languages divided the land between them. As far as her internal history is concerned, the dominating physical fact was the division of its surface into a Highland and a Lowland country. The River Forth "that bridges the wild Highlandman," dividing these two territorial sections by a natural line, has been, in fact, a determining factor in the development of the Scottish nation. To the north and the south of the Forth respectively there have existed to the present day two distinct peoples, speaking different languages and possessing different characteristics, partly the result of original racial idiosyncrasies and partly the result of their respective histories. The mutual relations between these two peoples, it will be seen, have been of the first importance in the history of the Scottish nation.

In the first quarter of the 11th century the entire mainland of Scotland was nominally consolidated under one ruler, Malcolm II, who came of the Celtic race beyond the Forth. Though territorially consolidated, however, there was little cohesion between the northern and southern sections of the kingdom, and the process in the next stage of national development (1100-1300) was the knitting of the bonds between the different peoples and their gradual subjection to an acknowledged head. In this process, also, there were general causes at work which were common to Christendom, and causes which were peculiar to Scotland herself. The general causes were the introduction of the feudal system, the organization of the Church with Rome as its centre, and the growth of towns and municipal institutions—all the result of the general movement among the countries of Western Europe. Peculiar to Scotland itself during this period of her development was the decisive supremacy obtained by the Teutonic over the Celtic peoples in the direction of the national destinies. The marriage (1068-93) of Malcolm Canmore, a Celtic prince, with the Saxon Margaret marks the beginning of the struggle between the two races which was to decide whether there was to be the Scotland which exists to-day. From that marriage issued a line of kings with Teutonic names, Teutonic sympathies, and with the abiding purpose of Teutonizing the national institutions. The reasons for this policy are sufficiently obvious. The country between the Firth of Forth and the Tweed, which had been acquired through conquest by the Celtic kings of the north, and whose inhabitants were mainly Teutonic, was the most valuable part of their kingdom, and naturally tended to become its political centre. From the death of Malcolm Canmore in 1093 to the death of Alexander III in 1286, therefore, the task of the successive Scottish kings was, on the one hand, to defend the southern part of their dominions against the

encroachments of England, and, on the other, to hold in check their Celtic subjects to the north of the Forth and in the extensive district of Galloway (also mainly Celtic) in the south-west. By the death of Alexander the task had been accomplished, and Scotland was now a consolidated kingdom, effectually ruled by one acknowledged prince, with Teutonic influences in the ascendant.

**The Struggle for Independence.**—The death of Alexander III's only heir, Margaret of Norway, led to the attempt of Edward I of England and his immediate successors to attach Scotland to the English Crown, and for more than half a century she had to fight for her bare existence as a nation. The results of the struggle were of the highest importance for the future of her people. Successfully maintaining her independence, by the very effort she made for self-preservation she became a united nation with a consciousness of a distinct destiny which had not been present to her even in the "golden days" of Alexander III. By the ordeal they had passed through, moreover, the Teutonic section of her people, who had been mainly interested in the issue of the struggle, acquired that national characteristic "the carl o' hemp in man"—that dogged persistence, which the world has recognized as a peculiarity of the typical Lowland Scot. But, as we shall see, there was another result of the struggle for independence which, if it did not affect the national character, powerfully influenced Scotland's laws and institutions, political, social and municipal. In the contest with England she had sought the alliance of France, and for two centuries and a half she was in closer contact with France than with England. Previous to the War of Independence it was from England she had borrowed what she needed; now it was to France that she looked as her model.

**The Development of National Institutions Under French Influence, 1472-1542.**—From the death of David II in 1472 to the beginning of the reign of Mary in 1542 is a well-marked period of Scottish history, during which the national institutions assumed the general form which they maintained till the union of the Scottish and English Parliaments in 1707. Throughout this entire period the dread of English aggression was still the constant preoccupation of the people, and this permanent dread at once deepened the national traits of hardihood and caution and contributed to the strengthening of national sentiment. In the development of institutions we have again to note the action of causes common to western Europe. Like the kings of other countries the kings of Scots deliberately aimed at crushing the power of the feudal nobles and establishing a central authority over which they should be supreme. But in this endeavor they were checked by two hostile forces—the power of the Scottish nobles themselves and the insubordination of their Celtic subjects in the Highlands and the Western Islands. As the result of these opposing forces, whose relative strength was constantly changing, a Parliament like that of England, with well-defined privileges and efficaciously representing the different classes of the people, could not come to birth in Scotland. In the Scottish Parliament or Estates (so-called in imitation of the French *Estats*), the Lords

Temporal and Spiritual, the Commissioners for the Shires and Burghs, sat in one House and nominally legislated for the nation, but the actual power of the Parliament was in the hands of a committee known as "The Lords of the Articles," the choice of which lay with the king or the greater barons according as the one or the other was in the ascendant. Till the Scottish Parliament ceased to exist, therefore, it was but the convenient instrument of whatever authority chanced to preponderate in the State. In the case of other institutions it was from France that Scotland borrowed the models she sought to imitate. It was from France, mainly during the period of which we are speaking, that she took over the Roman law, thus departing from the example of England; and the College of Justice (the present Court of Session), established by James V in 1532, was formed on the pattern of the *Parlement* of Paris. In the election of municipal bodies in the burghs the method of France was likewise adopted (the retiring body electing its successor), a method which prevailed till as late as the 18th century. From France, also, during the same period was taken the arrangement of feu-farm by which land was leased in perpetuity—an arrangement encouraged by the Estates and intended (ineffectually as it proved) to remedy the system of short and precarious leases which till the 19th century disastrously affected agriculture in Scotland. When to these borrowings we add the fact that the majority of highly educated Scots studied in the schools of France, it will be seen that, apart from the political results of the alliance, the influence of France in Scotland is one of the important facts in the national development.

**From the Reformation to the Revolution, 1542-1689; Adoption of Protestantism and Alienation from France.**—With the beginning of the reign of Mary (1542) Scotland makes a new departure and enters on a period which definitely closes with the Revolution of 1689. The dominating fact of the period was the adoption of Protestantism in place of Catholicism as the national religion (1560). The immediate result of the change of religion was alienation from France as a Catholic country and approach to England, with an ever-growing conviction on the part of both peoples that political union was in the interests of both. But there were other results from the religious revolution which permanently affected the national character and the future of the country. For the first time in the nation's history an issue was presented which the public mind was mature enough to comprehend and which was of a nature to evoke the inherent contrarities of thought and feeling which divide man from man. From the change of religion and the political consequences it involved there resulted a collision between two types of mind which have been in antagonism ever since. But this very collision of opposites produced a quickening of the general consciousness which made Scotland a nation in the strictest sense of the word. From the Reformation to the Revolution the country was cleft in twain by two opposing principles and two opposing parties, between which compromise was impossible and political equilibrium was unattainable. On the one side were the successive Stewart kings who

aimed at absolute control in Church and State, and on the other, the religious party which adopted Presbyterianism as its form of church polity and which maintained the Church's independence of the State. After a struggle that had lasted above a century came the Revolution of 1689, when England and Scotland both cast out the House of Stewart and a new order began.

**From the Revolution in 1689 up to the Present Time; the Union of Scottish and English Parliaments (1707); The Jacobite Risings; Subsequent Privileges; Modern Development.**—For Scotland as for England the Revolution marks the beginning of the modern time. Throughout the foregoing period theological considerations had dominated the public mind equally in affairs of Church and State; henceforward secular interests become more and more the impelling motives that determine the action at once of the State and of the individual. The immediate result of this changed attitude was the union of the England and Scottish Parliaments in 1707. In the previous century ecclesiastical differences had been a bar to this union; now considerations of reciprocal interests determined both nations to accept it. For Scotland the union was a necessity if she was to take her place among the nations. Hitherto she had labored under disadvantages which, in spite of the strenuous efforts of her people, had impeded her free development. Her remote situation, her limited area of arable soil, her long antagonism to England, her political and religious distractions, and, as the result of all these concurrent disadvantages, the meagreness of capital, had crippled her in all her efforts to develop her resources and to compete with more fortunate nations. The immediate consequences of the union, however, did not give promise of the future that was in store for her. The old jealousies between the two partners increased rather than abated, and for fully half a century Scotland sullenly acquiesced in a union into which (such was the feeling generally expressed) she had been entrapped by unscrupulous statesmen, and from which she had only received insult and injury. The Jacobite risings of 1715 and 1745 are the significant commentary on the state of feeling even in the Lowlands, but, as the issue of both enterprises proved, the heart of the nation was too deeply committed to the new order to revert to a régime that would have been inherently opposed to the spirit of the new time.

By the middle of the 18th century the advantages that accrued from the union were no longer doubtful, and henceforward the industrial and commercial progress of the country exceeded the expectations of its most sanguine advocates. Manufactures multiplied; the mineral wealth of the country and the riches of its seas were utilized for the first time on an extensive scale. Foreign trade had hitherto been almost entirely restricted to the exchange of commodities with the countries bordering on the German Ocean and the Baltic Sea, but by the opening up of trade with America, Glasgow, Greenock, and Paisley—mere villages at the time of the union—grew into great towns and important commercial centres. Hitherto, also, the three types of burghs, peculiar to Scotland—Burghs of

Barony, Burghs of Regality, and Royal Burghs — only the last had enjoyed the privilege of foreign trade in staple commodities, but this privilege gradually fell into abeyance, and every burgh with sufficient enterprise was at liberty to compete with its neighbors. In connection with the burghs a further progress has to be noted. In Scotland, as in other countries during the Middle Ages, trade and commerce had been shackled by conditions, necessary at the time but which were incompatible with free national development. Only Royal Burghs had possessed the privilege of being the homes of the great industrial crafts; in all the three types of burghs only burgesses had the right of pursuing any form of trade; jealous rivalry prevented free commercial intercourse between the different towns of the kingdom; and, finally, the fixing of the prices of commodities by the town councils or by the state obstructed the natural competition which is the life of trade. Later than in England, though not later than in France and Germany, these restrictions gradually ceased to be operative, and in 1846 "exclusive privileges" in trade and commerce were formally abolished by an Act of Parliament.

Thus by the awakened spirit of her people and the surprising development of her resources, Scotland, for long a thorn in the side of her more powerful neighbor, came to be England's valuable ally in the building up of empire. To the growth of the British colonies it is admitted that she has contributed even more than her relative share: the number of pioneers whom she has sent to New Zealand, to Australia and Canada is relatively greater than has proceeded from England, and equally out of proportion is the number of rulers and soldiers she has given to India and the other dependencies. In science, philosophy and literature it is sufficient to recall the names of Watt, Adam Smith, Hume, Burns, Scott and Carlyle, to prove that she has contributed her own quota to the common stock of material and spiritual wellbeing.

In the rapid development of the country the Lowlands of the south and east were the principal agents, but the Highlands also were powerfully affected by the transformation of the rest of the kingdom. The risings of 1715 and 1745 may be regarded as the last efforts of the Celtic population of Scotland against the Teutonic element, to which it had been in permanent antagonism since the time of Malcolm Canmore. Through the action of the government after the last attempts of the Stewarts to recover their heritage the Highlands ceased to be a source of danger, but became a source of economic perplexity. The social conditions under which the Highlanders had hitherto lived now came to an end: the time-honored raids into the Lowlands were no longer possible, and the Highland chieftain ceased to be a feudal lord and became a proprietor interested in the produce of his land. Thus arose the problem, even yet imperfectly solved, how under their conditions of climate and surface and soil the Highlands might be made a tolerable abode for their populations and a partaker in the general prosperity of the country. But, though in the past debarred by physical conditions from playing a main part in the material development of the country as a whole, the Highlander is yet a constituent element of the Scottish nation. The nature of his home, the romance that has come

to surround his character and his history are valuable assets among the national possessions. The natural complements the one of the other, the Lowland Scot supplies the cautious persistency, the sure hold of the fact indispensable in the conditions of modern life, while his Highland fellow-countryman by his quicker emotions and his natural grace is a standing reminder that there are other ideals than those of mere material prosperity.

**Religion and Education.**—We have seen that during the 16th and 17th centuries public affairs in Scotland were dominated by ecclesiastical considerations, and that at the Revolution of 1689 this domination came to an end, and material interests came more and more to occupy the public mind. Nevertheless, though religion thus ceased to be the determining factor in the national policy, it still remained a subject of absorbing public interest to the community at large, and throughout the 18th and 19th centuries religious controversy fills a large place in the national history. As a result of the Revolution, Episcopalianism, which had been made the national church by Charles II at his restoration in 1660, and which clung to the House of Stuart as its founder and patron, was disestablished in 1689, and Presbyterianism put in its place (1690), was bound by its own interests to support the Revolution régime. The National Church thus established remains till the present day, but in the course of the last two centuries there have been frequent secessions, resulting in the formation of various religious bodies of more or less importance. By the restoration of lay patronage in 1712 a division of opinion was created which led to the first Secession under Ebenezer Erskine, whose members are known as the "Associate Presbytery," or popularly as "Seceders." Among the Seceders themselves there soon arose a division regarding the oath of allegiance enacted from the Scottish burghs, from which sprang the two bodies, respectively denominated Burghers and Anti-burghers. In 1761 came another Secession from the Established Church, also occasioned by difficulties connected with patronage — the new Secession taking the name of the "Presbytery of Relief." In 1820 the Burghers and Anti-burghers united under the designation of the "Associate Synod of the Secession Church," and in 1847 this body joined that of the Relief, to form the "United Presbyterian Church." In 1843, one of the memorable years in Scottish Ecclesiastical history, the national church suffered its greatest disaster since the Revolution. Once more on the question of patronage, as involving the question of spiritual independence — the right of a church to independence of the state in all matters touching purity of doctrine — a numerous body of its ministers, led by Dr. Chalmers, effected the "Disruption" and set up what was known as the "Free Church of Scotland." Finally, in 1900, the Free Church and the United Presbyterian Church united under the name of the "United Free Church of Scotland." In this union, however, a minority of the Free Church refused to concur, and a judgment of the House of Lords (1904) decided that the property of the church belonged to the minority — a decision which occasioned an Act of Parliament appointing a commission to allocate the property between the two sections.

Thus at the present time in Scotland there are two main bodies of the Presbyterian Church: the Established Church and the United Free Church. The Scottish Episcopal Church and the Roman Catholic Church, the latter mainly consisting of persons of Irish extraction, are the two other chief religious denominations. In the recent history of Scottish elementary education the most memorable event is the Education Act of 1872, by which Board Schools were substituted for the old Parish Schools and education was made compulsory from the age of 5 to 14. In 1889 elementary education was made free. While Scotland has always compared favorably with other countries in elementary education, her provision for secondary education remains defective, though government grants for that purpose have wrought much improvement in recent years. Within the last half century the universities of Scotland have undergone reforms which have changed their original character and were intended to adapt them to modern needs. By the University (Scotland) Act of 1858 they received a common constitution, and by the Universities Act of 1889 this common constitution was further reformed. The supreme body in each case is a University Court; there is also a Senatus, consisting of principal and professors, who regulate internal administration. There are four universities—Edinburgh, Glasgow, Aberdeen and Saint Andrew's, to which last the University College of Dundee is affiliated.

**Law and Justice.**—The law of Scotland was originally based on Roman law, but there has been a gradual assimilation between the law of Scotland and that of England. This has been specially the case with mercantile law, which is now mainly identical in both countries. The system of real property law, however, is fundamentally different from that of England. In England the fee simple can be split up into estates for life, while fee simple in Scotland cannot be split up; and what is called a life-rent is merely a burden on the fee. Estates in remainder are unknown; the fee is destined to institutes and substitutes, and the word entail means in Scotland only a destination that cannot be broken except under defined conditions. In Scotland, in the law of contracts no consideration is necessary to make a contract actionable. In Scotland, law and equity have never been separated, but have always formed a single system. The law of personal and domestic relations, being largely founded on Roman law, differs in its broad principles from that of England. The tendency, however, has been to assimilate the two in the course of modern legislative changes. Marriage, for example, need not in Scotland be celebrated *in facie ecclesiae*, but can be constituted by mere informal contract of the parties. Marriages can also be more readily dissolved—desertion being sufficient ground of itself. The administration of the civil law is vested in the Court of Session subject to appeal to the House of Lords. This tribunal consists of an Inner or Appellate House, which sits in two Divisions, one of which is presided over by the Lord President and the other by the Lord Justice Clerk. There is also an Outer House, consisting of five Judges of First Instance who sit singly under the title

of Lords Ordinary. There are also in each county local courts with restricted jurisdiction, presided over by sheriffs or sheriff-substitutes, which in many respects correspond to the County Courts in England, but have a somewhat wider jurisdiction. The criminal law is administered by the same body of judges sitting on the criminal side and with a somewhat different organization. In his capacity as Head of the High Court of Justiciary, the Lord President is Lord Justice-General of Scotland. There are also Magistrates' Courts, burgh and county, which exercise police jurisdiction. These magistrates are for the most part unpaid laymen.

**18. IRISH HISTORY.** Ireland, lying to the west of Great Britain, forms one kingdom with it, which is known as the United Kingdom of Great Britain and Ireland. This designation was introduced in the year 1800, when the Act of Union which united the Parliament of Ireland with that of Great Britain was passed. So far as political institutions can avail, Ireland is one with the neighboring country. But in spite of the political tie she stands widely divided from Great Britain by most of the characteristics which are distinctive of a nation—historical traditions, racial spirit, social and economic

conditions. The distinction is marked even in the physical character of the island. Possessing little mineral wealth—iron ores in Antrim and Leitrim and some coal deposits in Antrim, Leitrim and Kilkenny—Ireland has not within itself the resources of a manufacturing country. The great central plain, stretching across the island from sea to sea, richly covered with vegetation, is adapted to pastoral and agricultural industries only, while the hilly regions to the north and south offer a soil that only tillage can make fruitful. Though water is abundant, water-power is deficient, owing to the generally low level of the country, fully one-half of which does not rise to an elevation of 300 feet above the sea.

**Ancient Legends.**—From the earliest times to which tradition reaches back Ireland was occupied by off-shoots of that great Celtic race which spread from the Hesperides to the English Channel. Lying within easy reach of the coast of Gaul it was exposed to the incursions of the sea-faring Celts of northern Europe. According to the ancient legends it was successively overrun and conquered by five different invading tribes. The last of these were the Milesians. The legends represent these invaders as migrating from Spain about 700 B.C. and establishing their sovereignty over the whole of Ireland. Modern scholars incline to the view that the story of the Milesian invasion is the record in tradition of an invasion by British Celts which took place most probably about the beginning of the Christian Era. The political organization of the Irish Celts was strictly tribal. The land of the country was parceled out among a number of petty chiefs or heads of tribes, who owed certain duties of tribute and service to the more powerful over-kings; above these again was the arid high or chief king whose authority was acknowledged in proportion to his power to make it effective. The tribal organization remained an enduring source of national weakness; it hindered the growth of an effective national power; it prevented any effective combination of the national forces against foreign invasion.

**Christianity Established.**—In the second half of the 5th century Ireland was converted to Christianity; its conversion was the work of a few years. That the new faith was accepted readily may be due to the fact that the previous religion of the people—if it can be called a religion—was ill-defined and unsystematized; a definite belief with a definite system of worship would not have been surrendered without a struggle. Saint Patrick and the other founders of the Irish Church accommodated themselves to the political organization of the country. Monastic institutions, established on lands granted by the converted chieftains, became the centres of church government, their jurisdiction being coterminous with the territory on which they were founded. They seem to have been regarded as identified with the local civil organization and were freely plundered and destroyed in the raids which, in the absence of a controlling central power, the petty rulers made on one another. This notwithstanding, monasticism exhibited remarkable developments in Ireland. For three centuries after the death of Saint Patrick the Irish monastic schools were the centres of learning in Europe. Scholars flocked to them from Great Britain and the continent;

and from these schools went forth the teachers who carried faith and knowledge among the Teutonic conquerors of the Roman empire. This missionary activity declined with the growth of civilized institutions in the new kingdoms that had been formed out of Rome's possessions. The source of supply was moreover sadly disturbed in Ireland. (See MONACHISM). At the beginning of the 9th century the Northmen, at the same time that they began their raids on England, extended their incursions to Ireland. They succeeded in establishing a few important strongholds on the coast and carried fire and sword through a country whose warring rulers met them as enemies or received them as allies according to the needs of their struggles with native rivals. The monasteries were a special object of hate to the Vikings; when their power was at length broken, in the 11th century, Irish monasticism was found to have run its course, and the field lay open to the Latin or Benedictine monasticism which was to succeed it.

**Establishment of English Power.**—With the 12th century opens that long chapter of Irish history which records the relations of Ireland to England. The history of those relations is the history of Ireland to the present day. In 1169 the first body of Anglo-Norman adventurers crossed the Irish Sea, the precursors of many a subsequent expedition. They came as the allies of a native chief who had been expelled from his territory. They came to stay, and after them came, in long succession, other bodies of adventurers. It was thus the foundations of English power in Ireland were laid. It was a fitful and tedious process, carried out for four centuries without any definite plan, and at no time during that period with forces sufficient to effect a general conquest. On the other hand the native Irish, owing to their tribal organization and to the absence of an effective central authority among them, were never able to unite for common defense against the invaders. The growth of a national spirit and a national life was rendered impossible. Politically there were two Irelands within the island—one, that portion of the country in which English law prevailed, and the authority of the English Lord Deputy was recognized, and which came to be called the Pale; and, outside this, another, ruled by Irish chieftains, or by Anglo-Norman lords who adopted Irish customs and who obeyed or resisted the authority of the Crown as suited their interests. Parliamentary institutions were introduced into Ireland soon after their establishment in England. But, as they were for the English settlers only, and were set in motion chiefly to provide subsidies for the English monarch, and as representation was bestowed much as the Lord Deputy chose to distribute it, the occasional summoning of a Parliament did little to promote the evolution of a national government. With the reign of Henry VIII came the Reformation (q.v.), and, with this, the introduction of a new element of discord into Ireland. Racial and political feuds were now intensified and embittered by religious antagonism. Throughout the desolating wars of Elizabeth's reign, the "Plantations" of James I, and the sanguinary campaign of Cromwell (q.v.) the policy of at once destroying the "Irish Enemy," and extirpating popery, was consistently pursued. The defeat of the Irish

at the Boyne (1690) made the English interest in Ireland definitively safe from armed attack. The English power was now supreme and it might have been anticipated that the country would enter on a career of economic and political development. But this was not to be for some time yet. Religious hate divided the country as effectually as animosities of race. A penal code was passed against the Catholic religion which demoralized alike those who administered it and those whom it oppressed. Mr. Lecky describes it as "ingeniously contrived to injure, to insult, and to impoverish the people of Ireland." It is evident there could be no development of political organization in a country four-fifths of whose inhabitants were by law excluded from Parliament, from the magistracy and from the bar, could not vote at elections, could not act as constables, sheriffs or jurymen, were debarred from every means of educating their children, from acting as schoolmasters, ushers or private tutors, could not marry Protestants or purchase "manors, tenements, hereditaments or life annuities." (Lecky).

**English Repression, Subsequent Poverty and Passage of Land Acts.**—A vigorous national spirit is the best cure for the excesses of religious intolerance, and through the 18th century there were causes at work which tended to create and develop this spirit. The English government, under pressure from English agriculturists and manufacturers, had, since the Restoration (1660), hampered by restrictive legislation every Irish industry which seemed likely to compete with England in the home or foreign market. This policy of stifling or starving industry affected Irish Protestants and Catholics alike and roused in them the sense of common national interests. The ablest spokesmen of the dominant party began to demand free trade for Ireland, a free Parliament and emancipation for the Catholics. Free trade and a free Parliament were secured and some of the more galling disabilities of the Catholics were removed. A genuine national life began to animate the country and its progress during the period of its Parliamentary independence was unexampled. As Lord Clare put it, "No nation on the habitable globe had advanced in cultivation, commerce and manufacture, with the same rapidity as Ireland from 1782 to 1800."

But in 1800 the Act of Union put an end to the Irish Parliament, checked the further growth of that prosperity which had been stimulated by distinctively Irish legislation and hindered the further development of that spirit of religious tolerance which the sense of common economic needs and interests was generating. Explain it as we may, England and Ireland will not, and apparently cannot, form one economic organism, in which one stream of industrial life will circulate. The long series of repressive acts directed against Irish industries is proof of this for the centuries that are past. For our own time, the proof is furnished still more cogently. The 19th century was, for Great Britain, a period of unexampled prosperity. Her growth in wealth, in power, in population was continuous. She secured for herself the supremacy among the manufacturing and trading nations of the world, and from that eminence she has not yet been displaced. But while Great Britain was thus rising to unexampled industrial greatness, the remaining portion of "the United Kingdom"

GREAT BRITAIN

Blarney Castle, Ireland

Custom House, Dublin, Ireland

was declining in wealth and population with a rapidity which has no modern parallel. Thirty years after the Irish Parliament had been abolished, the industries which had flourished under its care had almost disappeared. The people of Ireland were, in consequence, thrown wholly upon the land. Competition for the one available means of livelihood became excessive, holdings were divided and subdivided, and rents rose far above the economic level. The population grew, but the means of subsistence did not increase proportionately. The peasantry subsisted mainly on the potato crop; in 1846 this crop failed and famine followed. The repeal of the Corn Laws and the competition of foreign countries brought down the prices of agricultural produce. High rents could no longer be paid by small tillage farmers. The only farm industry as yet safe from foreign competition was that of cattle raising—the means of rapid transport from the United States, the Argentine Republic and Australia had not yet been perfected—and to make room for large grazing farms the small cultivators were ruthlessly cleared off the land. With the famine and the clearances began a movement of emigration which has reduced the population by nearly one-half. But in time the grazing ranches of the United States and the Argentine, and the sheep farms of Australia were brought within reach of the English markets, and prices fell so far that the graziers could no longer pay the high rents. An agrarian revolution was the consequence. The government intervened, first to fix farm rents on the basis of current prices, and, when this was found unsatisfactory, to mediate for the sale of the land to the occupiers with the aid of state credit.

A series of Land Purchase Acts was passed, and the transfer of the land to the tenants is now proceeding on a large scale.

**Remedial Legislation Passed by English Parliament.**—It must be said that the English government has done much during the last half century to repair the injustices of the centuries preceding. Let us reckon briefly what has been done. Passing over Catholic Emancipation (1829) and the establishment of the system of primary education known as the "National" system (1831), both of which measures belong to the first half of the century, we have to put to the account of the English Parliament and government the Disestablishment of the Irish Church (1869), which gave equality to all religions before the law; the system of intermediate education (1878); the Royal University (1879), defective inasmuch as it did not give university education, but merely tested it and conferred degrees; local government (1888), which bestows on elected bodies the administration of local affairs; the series of Land Acts designed to improve the position of the occupier—the Act of 1870, which put a check on arbitrary eviction and gave the tenant compensation for disturbance; the Act of 1881, which established a tribunal to which the tenant could appeal for the fixing of a fair rent; the Act of 1885, which made the first advance (£5,000,000) to the tenants for the purchase of their holdings; the Act of 1888, which made another advance of £5,000,000; the Act of 1891, which advanced £33,000,000 for the same purpose; the Act of 1896, which

amended the preceding acts; and, finally, the Wyndham Act of 1903, which facilitated the operations of purchase and increased the loan for buying out the landlords to £100,000,000, and the Land Act of 1909, providing further facilities for payment.

Previous to the passing of the 1903 measure a Department of Agriculture and Technical Instruction was established (1898) to instruct the people in the improved modern methods of agriculture and to diffuse among them a knowledge of the industrial arts.

Under these acts the operations of purchase have been carried out on a large scale. Up to 1902, under the earlier acts, over 70,000 tenants had purchased their holdings at sums amounting in the aggregate to over £20,000,000. In January 1906 the sales under the Wyndham Act had amounted to £7,207,548. Up to March 1917 the total amount advanced was £98,531,611, while £1,677,073 had been paid in cash by purchasers of estates. For the purposes of the Labourer Acts, 1906, 1911 and 1914 the Land Commission had advanced £4,586,821. The total number of holdings in 1917 was 572,045.

**Prospects.**—With all this remedial legislation the prospects of Irish industry are improving. The manufactures are confined chiefly to the northeastern corner of the island, where the shipbuilding industry of Belfast and the linen industry in the city and surrounding country employ a large number of hands. If we except the brewing industry in Dublin we may say that the rest of the country is devoted to farming. The farming is not of the intensive kind; of the 20,371,124 acres which form the area of Ireland close on 15,000,000 acres are devoted to permanent pasture and meadow, and thus, as has been said, "Two-thirds of the country is never touched by plough or spade." Under these conditions a large population cannot be maintained in comfort. Hence the ceaseless flow of emigration, chiefly to the United States and Canada. In 1841 the population was 8,175,124; in 1901 it was 4,458,775; in 1911, 4,390,219, and the drain still continues. The cost of the administration of justice is nearly double what it is in England, where the population is more than six times that of Ireland; and 10 times what it is in Scotland, where the population is about equal that of Ireland. Of the 103 members sent by Ireland to the Imperial Parliament over 80 are sent there to offer persistent resistance to the English government of Ireland. On the whole it must be admitted that under this government Ireland has not enjoyed the good fortune which the framers of the Act of Union promised her. Nor has Great Britain derived from the union the advantages which the authors of the measure anticipated. The predictions of Grattan and the other far-seeing opponents of the act have found melancholy fulfilment, and English statesmen of the present day seem warranted by the experience of a century in reverting to the policy—to which they are now committed—of trusting to self-government as the best means of securing material prosperity for Ireland and political harmony between the sister countries.

**The Churches.**—The principal religious denominations of Ireland are the Roman Catholic,

the Episcopal Protestant (late Church of Ireland, disestablished in 1869), the Presbyterian and the Methodist. The respective numbers of these communions, according to the census of 1911 are: Catholics, 3,242,670; Episcopal Protestants, 576,611; Presbyterians, 440,525; Methodists, 62,382; and other professions, 68,031. The constitution and government of the Catholic, Presbyterian and Methodist bodies are the same in Ireland as in other countries. The constitution of the Protestant Episcopal Church presents some points of special interest. The constitution of this church was framed under the Irish Church Act of 1869, by which the "Church of Ireland" was disestablished. The supreme authority is vested in the General Synod. The General Synod consists of two houses: the House of Bishops, which includes all members of the Protestant episcopacy, and the House of Representatives, consisting of 208 clerical and 416 lay members. These representatives are elected by the clerical and lay members of the Diocesan Synods, which, in their turn, are elected by the clergy and laity respectively of the several dioceses. The General Synod is the supreme authority in all matters relating to discipline and doctrine within the church. The funds of the church are held by a body of trustees called the Representative Body. The capital sums in the hands of this body amount, according to the most recent returns, to nearly £14,000,000 sterling. See ENGLISH NONCONFORMITY and ENGLISH ROMAN CATHOLICS.

**Executive.**—The supreme executive authority in Ireland is vested in the king's representative, the Lord Lieutenant, who enjoys the title of Lieutenant-general and General Governor of Ireland. He is appointed by the Crown, is a peer, and must be Protestant. Sometimes he has a seat in the Cabinet and takes an active part in the Government of the country; more frequently he is a mere figurehead, the real executive authority being held by the "Chief Secretary to the Lord Lieutenant." The Chief Secretary is usually a Cabinet Minister, and is responsible to the House of Commons for the acts of the Government. The salary of the Lord Lieutenant is £20,000; that of the Chief Secretary, £4,425. When the Home Rule Act of 1914 is put into effect this system of administration will be subject to changes.

**Local Administration.**—By the Local Government (Ireland) Act, 1898, administrative functions in reference to highways, public health, and relief of the poor, were assigned to local bodies elected by the rate-payers—Borough Councils for the six largest towns; County Councils for the counties; and under these, Urban Councils for the smaller towns, and Rural District Councils for the country districts.

**Judiciary.**—At the head of the Irish judicial system is the High Court of Justice, with a Court of Appeal. The High Court includes two divisions—the Chancery and King's Bench Division. The work of these courts is done by a Lord Chancellor and 16 judges, all appointed by the Crown. Cases of less importance are dealt with by the recorders of the cities, three in number, and 18 county court judges, who hold their sessions at various centres throughout the country. A numerous unpaid magistracy, assisted by "stipendiary" or paid magistrates,

deals with minor cases. The Criminal Justice Administration Act of 1914 provides for appeal in almost all cases.

**Police.**—The police force of the country is wholly under Government control. Dublin has a local police force, controlled by Government, consisting of 1,084 men at the end of 1916. The rest of the country is policed by the "Royal Irish Constabulary," a semi-military force of 10,000 men. The Imperial Government provides about £1,500,000 per annum to maintain the police and constabulary.

**19. WALES.** Wales derives its name from a Teutonic root meaning foreign, applied to the country by the English invaders of Britain. In Welsh it is called *Cymru* (formerly spelled *Kymry*), a name, in spite of a superficial resemblance, entirely unconnected with the Cimbri or the Cimmerii. The Welsh term for a Welshman is *Cymro* (plur. *Cymry*), a derivative of the old Celtic *Combrox* (plur. *Combroges*), meaning a "fellow countryman." This name is now thought to have been given by the Welsh and the northern remnants of the ancient Britons to themselves in post-Roman times in their joint struggles against the English. Before this they seem to have used for themselves

the general term Britons (Lat. *Britanni, Brittones*). For certain purposes, chiefly educational, Monmouthshire is now counted as part of Wales. In Roman times the chief tribes in Wales were the Ordovices in the north and centre, the Silures in the southeast and the Demetæ in southwest Wales. In the post-Roman period, and until the assimilation of the Welsh territorial system to that of England, the chief divisions were Gwynedd (in the northwest), Powys (in the centre and north-east), Gwent (in the southeast) and Dyfed (in the southwest), together with the contiguous parts of South Wales. This latter division in its totality was often called Deheubarth (i.e. the south part). These divisions practically survive in the dioceses of Bangor, Saint Asaph, Llandaff and Saint David's respectively. The country was anciently divided into cantrefydd (hundreds), and each cantref was usually divided into two cymydrau (commotes). Some of these cantrefydd (pl. of cau[t] (*hundred*), and tref (*homestead*), such as Rhufoniog (Romaniacus), in Denbighshire, Dunoding, the land of Dunod (from Donatus), in Carnarvonshire and West Merioneth, bear Latin names, and must have clearly obtained these names during or after the Roman occupation. The division into county and borough divisions is due to the assimilation of the Welsh territorial system to that of England. The title "Prince of Wales," derived from the ancient principality of Wales, is now conferred by the reigning sovereign on the heir-apparent. In recent times, the connection of this title with Wales has been emphasized by the acceptance of the office of Chancellor of the University of Wales by His Majesty King Edward VII, then Prince of Wales, and afterward by the present king. Wales has also recently received recognition of her national emblem of the Red Dragon as part of the armorial bearings of the Prince of Wales.

The Welsh people, though comprising sub-varieties, form a distinct type among the peoples of the United Kingdom. The cause of this are largely physical and economic, acting from the remotest times, and on this basis the Welsh have developed a political, social and mental history of their own. The individuality of Wales is the more remarkable owing to her proximity to England and her exposure to English influences. The country stands, however, in the most obvious contrast to the central plain of England on which it borders, and its individuality has, to a great extent, a geographical basis. Wales consists almost entirely of a mass of mountains and uplands, intersected by various streams and rivers, the largest of which, the Dee, the Severn and the Wye, are on the east. In the lower valleys and the more level districts of the country, there are tracts of good land, but the upper valleys in the mountainous districts are subject to very heavy rain-falls, and are of little value for agriculture. There are also many large upland tracts, which can only be used for sheep-grazing. The population of rural Wales varies in density, but, owing to the smallness of the farms, it is often larger in proportion than in some of the agricultural districts of England. In the last century the distribution of the population of Wales underwent a great change by the discovery

(especially in the south Wales coal-field) of great mineral wealth; and the consequent attraction of large masses of people into the industrial districts. These economic developments, too, have had a great effect on the social evolution of modern Wales.

**Social Evolution and History.**—The available evidence as to the prevalent type of the Welsh people shows that they are on the whole less fair, tall and bulky than the farmers of the English plains. They are, as a rule, more wiry and hardy than muscular, and a certain predominance of the nervous over the muscular system gives them, in certain districts especially, an air of keenness, sensitiveness and vivacity. The freshness of the air and the beauty and variety of the scenery also contribute to this end, as well as to an appreciation of linguistic aptness and poetic imagery. The excellent voices of Welshmen, too, are mainly due to the purity of the air. Brachy-cephalic types are rare, but mesocephalism prevails. Though the extreme blonde type is uncommon, there is a fair proportion of light or reddish hair, and in South Wales especially, a considerable admixture of pale-faced, black-haired and markedly dolicho-cephalic men, who look as if their type had been evolved in the shelter of the ancient forests of the country. Generally speaking, it may be stated that the prevalent types are the natural counterparts of the conditions of life of the Welsh farmer and his dependents, with its hard toil, careful calculation and plain fare.

The necessary interdependence of the members of the scattered communities of rural Wales has produced a certain sociability, fluency and aptitude for co-operation in public affairs, though in religious matters there is considerable cleavage. The chief religious denominations are the Calvinistic Methodists, the Independents and the Baptists. In purely Welsh districts crime is very rare. The conditions of Welsh agriculture from the remotest times, under necessities of soil and climate which often frustrated man's best hopes, have created a deep-rooted sense of man's dependence on powers that are beyond his control, and beneath the markedly religious spirit of the Welsh people there lies this fundamental instinct, the traditional intensity of which at times finds vivid expression. To this feeling are also linked a sense of the pathos of life, which has found utterance in Welsh poetry, a deep attachment to the soil, a minimizing of the importance of human distinctions in the face of the powers of nature, and a passion for a kind of natural justice, which has expressed itself in modern times mainly in a demand for religious equality and the disestablishment and disendowment of the State Church, and in the desire to correct by means of education the disabilities of birth and station.

The social evolution of the country has been largely conditioned by its geography. This is such that the economic value of land varies greatly. Until recent times, the stress of competition was almost entirely for the surface products of the soil. The discovery of mineral wealth, however, has now given the economic, social and political evolution new directions. In the hunting, pastoral, fishing and agricultural life of man in the Stone, Bronze and Iron Ages, right down to modern times,

whether Wales was invaded by Iberian, Goidel, Brython, Belgian, Roman, Saxon or Norman, the motive of the struggle was essentially the same, namely, the possession of the good lands of the country, such as the river valleys and the flatter districts afforded. In Wales, the records of the ancient system of land tenure suggest that the weaker and stronger communities came to be interspersed, the better type of holdings being held by freemen in family groups, while the unfree villagers farmed their land mainly by a system of cotillage. The basis of social life was mainly tribal, and the necessary social adjustments produced a correlative body of custom and law.

The successive invasions of the country have left numerous archaeological traces, as for example, the fortresses of unmortared stone of which Treceiri in Carnarvonshire is an excellent instance. This fortress is now assigned by archaeologists to about 100-50 a.c. The Romans developed the road communications and worked some of the lead mines of the country. After the departure of the Romans, the western coasts were harassed by invaders from Ireland, and Britons from the north appear to have been invited to assist in their expulsion. Some of these families, notably that of Cunedda Wledig, remained in Wales and became the founders of Welsh local dynasties. The struggles against the English and the Normans brought war into the foreground of Welsh life. The conquest of Wales by Edward I led to the establishment of a network of castles and garrison towns, governed by English law and custom, while the country districts remained Welsh. This led to constant friction, and the revolt of Owen Glyndwr (Glendower) was essentially a struggle of the country against the towns. The reign of Henry VII (a descendant of an Anglesea Welshman, Owen Tudor) was hailed with great enthusiasm in Wales, but it was this prince and his son Henry VIII who finally assimilated the Welsh legal system to that of England. Wales maintained its attachments to the Crown even through the Civil War, and until the second half of the 19th century was mainly conservative in politics.

The discovery of coal, slate, lead and other minerals, as well as the industrial and commercial revolution generally, has given the life of Wales a new aspect. In Glamorganshire, Monmouthshire, East Carmarthenshire, East Denbighshire and the slate districts of Carnarvonshire there are thriving and progressive industrial communities, with corresponding facilities for communication by land and sea. The rapid development in question is well exemplified in the case of Cardiff, (q.v.) which has grown in a few decades from being a moderate sized market town into one of the leading coal-ports of Britain. New docks, too, for Irish and Atlantic traffic have been built by the Great Western Railway at Goodwick in Pembroke-shire. There is in Wales a considerable seafaring population and in Montgomeryshire, Carmarthenshire and Merionethshire there are some woollen factories. The industrial districts of Wales and the large towns of England, as well as the United States and the colonies, have absorbed the superfluous population of the Welsh country districts, until depopulation has

in several places been the result. The price of agricultural labor has gone up, and, owing to the greater possibility of finding employment elsewhere, there is a more independent attitude toward the governing classes in religion and politics. Local government has more and more fallen into the hands of Liberals and Nonconformists, and there are now no Welsh Conservatives in the House of Commons, but the land-owners are mostly Conservatives. See LOCAL GOVERNMENT in this section.

Side by side with this development, there has grown up a desire for a measure of national self-government, especially in the sphere of education; and the first instalment of this was given in 1897 by the establishment of the Central Welsh Board for Intermediate Education, for the purpose of controlling the secondary schools founded under the Welsh Intermediate Education Act of 1889. These schools have made very rapid progress, and there are now about 120. The establishment of the University of Wales, federating the University College of Aberystwyth (founded in 1872), Bangor (1884), and Cardiff (1883) is a phase of the same movement. (See also BRITISH EDUCATION — WALES). Royal charters, too, have been granted for the foundation of a Welsh national museum at Cardiff and a Welsh national library at Aberystwyth. Several private collections of Welsh MSS. have been already bought for the latter. The great difficulty, however, in the way of complete national development and unification is the absence of a metropolis within easy reach of all parts. The most convenient meeting-place for the whole of Wales is Shrewsbury (the ancient Pengwern), which lies outside the Welsh border.

In addition to the foregoing factors of modern Welsh development, it should be stated that in the summer months there is a very great influx into Wales of visitors from England and elsewhere, in search of health and pleasure, and that for their accommodation whole towns have grown up along the coast. This link with England has helped to bring Wales more and more into closer touch with the outer world, while still living its own life and maintaining its individuality. Of the fine arts music and poetry are the only ones that have received extensive cultivation.

**20. NATIONAL FINANCE.** **National Debt.**—The National Debt of the United Kingdom, in the sense in which the term is understood in several official returns, amounted on 31 March 1914 to £650,000,000, but in addition to this there were various amounts outstanding which had been borrowed for military, naval, and other works and brought the "Aggregate Gross Liabilities" up to £706,000,000. Further, a sum of £74,000,000 had been borrowed and lent to local authorities, and another sum of £95,000,000 had been borrowed for the purpose of establishing occupying land-ownership in Ireland by the expropriation of the former landlords. The total £875,000,000 nominally consisted of £539,000,000 of consolidated 2½ per cent stock ("consols") redeemable at par at the option of the State only after April 1923, £47,000,000 of nearly similar stocks and permanent debt to the Banks of England and Ireland, £33,000,000 of treasury bills and exchequer bonds repayable at various dates, £86,000,000 of the capital value of terminable annuities including those raised for various works chiefly connected with the navy and the post-office, £74,000,000 of local loans 3 per cent stock and £95,000,000 of 2¼ per cent and 3 per cent Irish land stock. But most of the terminable annuities, about £86,000,000 of the consols, and about £91,000,000 of the other securities were not in the hands of the public but were held by the State itself against its liability to the savings bank depositors, so that it would give a truer account of the real position to say that the total debt consisted of about £640,000,000 in the securities just enumerated, and about £240,000,000 in money payable on demand or at very short notice to savings bank depositors.

The main body of the debt was chiefly due to the wars in which the country was engaged between 1688 and 1815. During that period the debt grew from nothing (except a trifling sum which Charles II had borrowed from the goldsmiths) to £900,000,000. It then underwent steady diminution till in 1899 it had fallen

to £628,000,000. The South African war brought it up again to £771,000,000 in 1903, since which year it had once more been diminishing. The £56,000,000 of works debt had all been incurred since 1890, and most of it since 1900, when it only amounted to £10,000,000. The amount lent to local authorities was only £8,000,000 in 1840 and £26,000,000 in 1887. The Irish land debt took its rise in 1891, but most of it is much more recent.

The interest and sinking fund of the Irish land debt is naturally provided for chiefly by the payments made by the new Irish landowners, who are paying for their land by instalments, but a portion falls on funds which would otherwise benefit Irish local taxpayers and another portion is defrayed by the taxpayers of the United Kingdom. The local loans debt is adequately provided for by the interest and repayments received from the local authorities. The works debt is made a charge upon the annual parliamentary votes for the departments concerned, in such a way that each loan will be extinguished in 30 years at most. For the main body of the debt the practice has been since 1876 to devote by legislation a certain annual sum, called the "permanent" or "fixed" annual charge, to interest and repayment taken together. As the sum thus devoted considerably exceeds the interest, this plan, if carried out without modification and without interruption owing to fresh borrowing, would practically convert the whole debt into a terminable annuity and extinguish it in a very moderate length of time. But as a matter of fact the "fixed charge" was reduced from £28,000,000 to £26,000,000 in 1888 and by two steps to £23,000,000 in 1900, and it was only the fresh borrowings of the South African war which led to its restoration to £28,000,000 in 1905 from which it was reduced to £24,500,000 in 1910-11. The difference between the "fixed charge" and the interest is sometimes called the "New Sinking Fund." The "Old Sinking Fund" is any actual surplus realized in the year. The general law is that this also must be devoted to repayment of debt, but when any considerable surplus happens to be realized, special legislation usually interferes with the operation of the rule. As stated above, the foregoing shows the development and position of the National Debt at 31 March 1914. By the same date in 1918, after 44 months of the European War, the gross debt was estimated at £5,850,000,000, of which sum about £1,600,000,000 represented advances made by Great Britain to her Allies and Dominions.

**Expenditure.**—The total expenditure on revenue account for the financial year 1913-14 is stated at £197,500,000. The total may be classified conveniently as follows: Fixed annual charge for the main body of the debt, £24,500,000; army, £28,000,000; navy, £49,000,000; old age pensions, sickness and unemployment insurance, £20,000,000; education, £28,000,000; miscellaneous, including the cost of collection of taxes, the administration of justice and the civil services not included under heads already enumerated, £22,000,000; post office, including telegraphs and telephones, £25,600,000; and amount handed over to local authorities, £10,000,000. The amount credited to education is chiefly made over to local school authorities, but only on conditions which give the central

government a very large measure of control, not only over the expenditure of the money so granted, but also over what is raised from local sources. The £10,000,000 granted to local authorities, commonly called the "Exchequer Subsidies" or "grants in aid of rates," consist of sums which are either fixed or vary with the yield of certain taxes and are not now directly connected with central control, with the exception that an amount equal to half the cost of the pay and clothing of a police force may be deducted from the grants due to an authority if it fails to maintain its police force to the satisfaction of inspectors employed by the central government. The method of distribution between the various authorities is extremely complicated and differs in England, Scotland and Ireland. Scarcely anyone professes to understand it and it is based on no sort of principle except that it is largely dependent on certain proportions which prevailed in 1888. This plan was adopted as a temporary expedient and has been continued not on account of its merits, but because it existed. These figures, again, refer to the last normal year before the war, an event which naturally influenced the whole domain of national finance.

**Revenue.**—The total revenue amounted to £198,000,000. The great heads were: Customs, £35,500,000; excise (internal duties on commodities), £39,600,000; estate duties (inheritance taxes), £27,400,000; income tax, £47,200,000; stamps, £10,000,000; house duty, £2,000,000; post office, including telegraph and telephones, £30,800,000; and miscellaneous revenue, £4,800,000. The duty on imports of tobacco brought in £18,300,000; tea, £6,500,000; sugar, £3,300,000; spirits, wine and beer, £4,500,000. The excise drew in one way and another over £37,000,000 from taxes on the manufacture or sale of beer and spirits, so that about £42,000,000, or 26 per cent of the whole tax-revenue, was derived from intoxicating liquors. The inheritance taxes, christened by Gladstone and now commonly called the "Death Duties," consist of two distinct parts, one of which is graduated from one to fifteen per cent according to the aggregate value of the whole property left by the deceased; so that if a man dies worth £400, one per cent has to be paid and if he dies worth over £1,000,000, 15 per cent. The other part is graduated according to the relationship of the new owners of the property to the deceased, so that for example, while property bequeathed to descendants or ascendants is charged one per cent, property falling to brothers or nephews is charged 5 per cent and property falling to other persons is charged 10 per cent. Thus, taking the two parts together, if a man leaving £16,000 bequeaths it all to his children, 6 per cent only will be paid, while on a millionaire's property left to persons not related to him, the duties will together amount to 25 per cent. The Income Tax was levied at the standard rate of 1s. 2d. in the £ (i.e., 5.83 per cent), but incomes under £160 were exempt and certain graduated "abatements" were allowed on incomes between £160 and £700. Reduced rates were charged on "earned" income when the total income, earned and unearned, of the taxpayer, was not over £3,000, viz., 1s. in the £ when the total was between £2,000 and £3,000 and 9d. when it did not exceed £2,000. Much the greater portion of this tax is "collected at

the source," or at any rate before the income actually reaches the ultimate recipient. For example, the tax on the income arising from lands and buildings is collected from the occupier, who then, if he is not the owner, has an inalienable right to deduct the tax when paying his rent; so too the tax on the income from stocks, shares and bonds of corporations is collected from the corporation. But this practice does not defeat the right of the individual landowner or stockholder to exemption or abatement if his total income from all sources is under the prescribed limits; he makes up accounts with the collectors, declaring his whole income and showing how much has been deducted from its various parts and if it then appears that too much has been paid, the excess is repaid to him in cash. So far as the portion collected at the source is concerned, the tax works with great efficiency. The amount of evasion which takes place in regard to the other part, for which personal declarations of the amount of income are required, is very variously estimated, but there is little doubt that it is in process of diminution owing to the greater publicity of modern methods of business and to the checks supplied by the death-duties, which are administered by the same department. In 1909 a supplement to the Income Tax called the Supertax was introduced. It was a tax of 6d. in the £ (2½ per cent) on the amount by which an individual taxpayer's total income exceeded £3,000. It is not collected at the source but on the declaration of the taxpayer. The yield, about £3,300,000, is included in the £47,200,000 of income tax mentioned above. Stamps consist mainly of duties on commercial and speculative transactions. The House duty is levied at the rate of 9d. in the £ (3¾ per cent) of the rental value, but there are lower rates for houses of between £20 and £60 rental value, and houses under £20 in Great Britain and all houses in Ireland are exempt. The difference of £6,200,000 shown between the post office revenue and expenditures is almost entirely due to the mails, the telegraph and telephone business being unprofitable. In miscellaneous revenue the most important item is £1,250,000 from the Suez Canal Company's shares, which, it is well to remember, are a wasting property, the canal having been constructed on a 99-year concession.

**War Finance, 1914-18.**—Shortly after the beginning of the war Mr. D. Lloyd George, then Chancellor of the Exchequer, estimated the daily expenditure of Great Britain in the conflict at \$3,750,000, which he said was a *diminishing* figure. For the financial year 1913-14 the total revenue stood at \$991,215,000, and the expenditure was \$987,463,500. Owing to the general financial panic prevailing in Europe during the pre-war international crisis, the London Stock Exchange was closed on 31 July 1914 by order of the government, and it remained closed till 4 Jan. 1915. On 2 Aug. 1914 a moratorium was proclaimed in Great Britain, which lasted till 4 December. On 6 August Parliament took the first vote of credit for war purposes—\$500,000,000, and the second came on 16 November, for \$1,125,000,000, when the Premier (Mr. Asquith) announced that \$50,000,000 had been advanced to Belgium and \$4,000,000 to Serbia. Between August and November (1914) Treasury Bills to the amount of

\$450,000,000 were issued, and in the latter month the first great War Loan for \$1,750,000,000 was issued in the form of stock at 95 per cent, redeemable in 1925-28, and bearing interest at 3½. The net yield was \$1,615,000,000, which sum was intended to include the repayment of the Treasury Bills issued. The revenue rose rapidly. In 1914-15 it was \$1,351,660,000, with expenditure of \$5,568,270,000; in 1915-16 it was \$1,684,000,000, with expenditure of \$7,795,790,000. In 1916-17 the revenue rose to \$2,667,140,000, and the expenditure to \$10,990,565,000; in 1917-18 the revenue was estimated at \$3,062,500,000 and the expenditure at \$11,451,905,000. The highest point was reached in the Budget for 1918-19, which provided in round figures no less than \$15,000,000,000, with estimated revenue of \$4,200,000,000, leaving the balance of \$10,800,000,000 to be covered by loans. The additions to revenue came chiefly from increases of the income and super tax, the customs and excise, from the new excess profits duty—beginning with 60 per cent on profit in excess of that obtained before the war, and the heavy "luxury taxes" imposed in 1918. The gradual rise in the war bill of Great Britain and the various votes of credit, loans, etc., by which the money was raised is shown in the following summary:

On 1 March 1915 a vote of credit for \$185,000,000 was passed to cover expenditure to that date. The total voted since the beginning of the war to this date—eight months of war—amounted to \$1,610,000,000, and represented the difference between the expenditure of the country on a peace footing and that on a war footing. The average cost of the war per day was now \$7,500,000. On the same day (1 March) another vote of credit was passed for \$1,250,000,000 to carry on the war for a period of somewhat more than three months. This was the largest vote of credit in the annals of the House of Commons. On 15 June 1915 a supplementary vote of credit (the 5th) for \$1,250,000,000 was taken. The average daily expenditure had risen to \$13,300,000, after standing at \$7,500,000 for 240 days—in addition to the expenditure of the normal peace votes. On 20 July 1915 a supplementary vote of credit for \$750,000,000 brought the total for the year up to \$3,250,000,000, and a grand total of \$5,560,000,000, since the outbreak of the war. On 15 Sept. 1915 a vote of credit for \$1,250,000,000 was raised to cover expenditure to the middle of November. The daily cost of the war from 1 April to 30 June was given as \$13,500,000; from 1 July to 17 July it stood at \$15,000,000; and from 18 July to 11 Sept. 1915 it was over \$17,500,000 per day. On 11 Nov. 1915, a fresh credit vote for \$2,000,000,000 was taken, and two more on 21 Feb. 1916, one for \$600,000,000 to cover the remainder of the financial year, and one for \$1,500,000,000 to start the new financial year beginning on 1 April 1916. On this occasion the Premier stated that the total for votes of credit since August 1914 amounted to \$10,400,000,000, with loans to Allies and dominions to date amounting to \$844,500,000.

By 23 May 1916, when the 11th vote of credit for \$1,500,000,000 was taken, the daily expenditure on the war had risen to \$23,750,000. On 24 July 1916 the 12th vote, for \$2,250,000,000, represented the largest sum ever asked for by any government in British financial history.

This sum was to carry the war to the end of October, and on the 11th of that month another vote of \$1,500,000,000 was designed to last till Christmas. A vote of \$2,000,000,000 on 14 Dec. 1916 brought the total expenditure since the beginning of the war to \$19,260,000,000, while the daily cost for the last 63 days had been \$28,550,000. On 12 Feb. 1917 two votes of credit for \$2,750,000,000 broke the "record" of the previous July; the daily expenditure had risen to \$28,950,000; total since August 1914, \$21,500,000,000; advances to Allies and the dominions, total, \$4,450,000,000. On 15 March 1917 a vote for \$300,000,000 was taken and the national expenditure reached about \$30,000,000 per day. A vote for \$2,500,000,000 on 9 May 1917 was estimated to pay war expenses to about the 1st of August; by this time British loans to her Allies and colonies attained to \$10,000,000 daily. The greatest vote of all came on 24 July 1917, when \$3,250,000,000 was asked for and granted, bringing the amount voted for 1917-18 to \$7,500,000,000, and for the whole war to date, \$27,460,000,000. Another \$2,000,000,000 was voted on 30 Oct. 1917 and a further sum of \$2,750,000,000 on 12 December. A government White Paper issued in May 1918 estimated the cost of the war to Great Britain at 31 March 1918 to be \$63,750,000,000, of which sum \$46,525,000,000 had been spent on the army, navy, air service and munitions and ordnance works, and that Treasury loans amounted to \$8,750,000,000.

During 1918 further votes of credit were taken: \$2,500,000,000 on 18 June, when the daily expenditure was stated to be \$34,240,000, with debts due from Allies, \$8,850,000,000 and from British dominions, \$1,030,000,000; on 2 August a vote of \$3,500,000,000 brought the total for the current year to \$9,000,000,000. On 1 Aug. 1918, Russia owed Great Britain \$2,940,000,000; France, \$2,010,000,000; Italy, \$1,565,000,000; Belgium, Greece and Serbia together, \$595,000,000. At the end of July 1918, United States loans to Great Britain amounted to \$3,345,000,000. The first British war loan has been mentioned above (November 1914); the second yielded \$3,080,000,000; the third, of \$5,000,000,000, was opened 2 Oct. 1917 and was to remain open till further notice. The loan reached the \$5,000,000,000 mark on 15 Aug. 1918. The Chancellor of the Exchequer had decided to ask the country to lend the money as it was needed, at 100 million to 125 million dollars per week. For over 10 months money had flowed in steadily at an average weekly rate of \$110,000,000. On 13 Nov. 1918, two days after the signing of the armistice, a vote of credit for \$3,500,000,000 was taken, when the chancellor stated that Great Britain's debts abroad were not expected to exceed \$5,000,000,000, and that the country could easily bear this if labor and capital worked harmoniously together.

**Local Finance.**—To give an absolutely accurate account of the finances of local authorities in the United Kingdom is impossible owing to the complicated relationship of the various local authorities to each other and to the central government, and also because the three kingdoms, England, Scotland and Ireland, have entirely different systems and methods of accounting. The aggregate debt in 1913-14, including of course the £74,000,000 of debt to the central government mentioned above, is stated (after

deducting accumulated sinking funds) at about £655,000,000, but about £70,000,000 of this consists of the debt of harbor and dock trustees which is secured only on the harbors and docks, and in no way upon the taxes of any locality, and therefore ought not to be reckoned as local debt. The remainder represents capital invested in (taking the larger of the various items approximately in order of magnitude) waterworks, street and road improvements, schools, drainage, gasworks, tramways, electric works, work-houses, asylums and the innumerable other works and buildings required by modern civilized and especially urban communities. The aggregate annual repayments of debt and payments to sinking funds amount to a little over 2 per cent on the total, but the annual additions considerably exceed this amount, so that the debt increased nearly £300,000,000 in the first 13 years of this century. In this period however there have been two exceptional increases. In 1903 the capital of the London water companies was converted into debt of a board representing the various local authorities within the area of supply; this added about £46,000,000 without much altering the liabilities of the inhabitants or owners of the area concerned. In 1909 an addition of £23,200,000 was made by a similar conversion of dock companies' capital into stock of the Port of London Authority. About half the total capital has been raised for purposes which are often provided for by private enterprise, such as waterworks, gasworks, docks, electric works, tramways and cemeteries, and the other half for purposes which are seldom so provided for in modern communities.

The expenditure from revenue of the authorities, including repayment of debt, amounted in the year 1912-13 to about £170,000,000. About £26,000,000 of this was met by the allocated taxes and other national grants, chiefly for education, spoken of above, about £80,000,000 by "rates," and the rest by the special charges levied for commodities and services supplied, and all kinds of miscellaneous revenue.

The "rates" are taxes levied by the local authorities at a rate of so many shillings or pence in the pound of the annual value of land and all things attached to the land in the concrete form of buildings or works of any kind. The idea of the Elizabethan rate for the relief of the poor undoubtedly was to assess inhabitants according to their ability, and down to 1840 attempts were frequently made to extend the system which long prevailed in some parts of the country of assessing stock in trade and other visible personal property. But experience showed that such taxation was utterly unsuitable for small localities, and when the law courts at last began to favor these attempts, legislation intervened. The tax is usually levied from the owner in the important case of small house property in England, but in almost all other cases from the occupier of the property. The occupier has no right of deducting rates paid from his rent unless he has so contracted with his landlord, and a contract of this kind is scarcely ever made. There is at present, under the Agricultural Rates Act, a rebate of 50 per cent in favor of agricultural land, and there are some other differentiations in the cities. The "rates" are elastic, certain, cheaply collected, and singularly free from disturbing

effects upon production. The fact that they are unpopular is sufficiently accounted for by their enormous yield and their obvious character.

**Financial Control.**—The finance of the central government, according to the present theory of the British Constitution, is vested in the House of Commons. All financial legislation must originate there, and the Commons will not permit any alteration of their measures by the Lords. But in the House of Commons itself the power of initiation in matters of finance is now entirely in the hands of the Ministry. Estimates of expenses and receipts made up in the government departments are considered or amended by the Ministry in private. The result is then laid before the House of Commons by the Chancellor of the Exchequer in his "Budget Speech." A ministry will rarely submit to modify its proposals in any important respect, so that the House has to choose between acceptance of the budget and a change of government. No ordinary member of the House can directly propose an increase in taxes or expenses, the theory being that it is the King who asks his faithful subjects for money, but anyone may propose reductions. The estimates are put before the House in immense detail, but this very detail defeats its own end, as there is not and cannot be, time to consider the whole to any good purpose. The estimates are consequently passed without material alteration. This absence of real control by the House of Commons is probably favorable rather than unfavorable to economy. The necessity of finding new taxes or increasing old ones is much more immediately before the eyes of the Ministry than of the House of Commons, and the Ministry has also more reason to fear popular resentment against any increase of taxation. It is, moreover, in immediate and constant association with permanent Treasury officers whose influence is generally cast against temporary expedients for staving off the day of reckoning.

In the councils which conduct the local government of the country there is nothing like the Ministry in Parliament, and the system of control consequently has a nearer resemblance, as has sometimes been observed, to that prevailing in the United States Congress. The committees charged with the various departments of the council's work, with the assistance of their executive officers, each prepare their own estimate of expenses for the coming year. These are then all added up and put before the finance committee, which usually hands them on with little or no alteration to the council, merely adding its own estimate of receipts other than rates and a recommendation to the council to make a rate of as many pence in the pound as is calculated to make up the balance required. The council discusses the estimate of receipts and expenses thus put before it, and any member may move alterations in any item. Such motions are frequently made and sometimes, especially, of course, in the smaller councils, carried.

The local authorities have no power to contract debt without special authority. For most purposes this now means that sanction must be obtained either from Parliament by special act or from the department of the central government, called the Local Government Board. Loans must always be accompanied by provisions for repayment within the time for which

Parliament or the Local Government Board's inspectors calculate the work on which the money is to be spent will last. That the prescribed sum is being set aside every year for repayment is ascertained by the Local Government Board in each case. Some authorities are forbidden by statute to borrow more than an amount bearing a certain proportion to the annual ratable value of their area, but these enactments are rendered practically inoperative by other legislation, and have no influence whatever.

Out of annual revenue the authorities may generally spend as much as they please, the unpopularity of rates being regarded as a sufficient safeguard against extravagance. In regard to one expenditure only, that for poor relief, the central government attempts to prevent too much being spent, at any rate in one or two directions, such as relief to persons not required to enter the workhouse and relief to the able-bodied. In other matters the influence of the central government, when exercised, is almost always in favor of increased expenditure. The threat of "withdrawal of the grant" in respect of a particular school is used every day by inspectors of the central board of education in order to compel a local authority to spend more. The central government appoints officers to audit the accounts of the greater number of local authorities, but the auditors of the municipal boroughs (which include all the great cities) in England are elected, under the Municipal Corporations Act of 1832, by the ratepayers. This election is almost always a farce, and the more important city councils have had to provide a proper audit in addition to the one thus provided by law.

**Bibliography.**—Information as to the actual position of British finance can only be obtained by piecing the facts together from a large number of parliamentary publications, usually known as "Blue-books." Among the most important of these are the annual returns entitled 'National Debt,' which shows the different kinds of debt existing at the end of each year from 1835 to date; 'Government Departments Securities,' which gives the amount of the state's securities held by the state itself; the finance accounts of the United Kingdom; the 'Postmaster-General's Report,' the 'Annual Local Taxation Returns for England and Wales,' and the same for Scotland and for Ireland conveniently summarized in the annual 'Statistical Abstract for the United Kingdom.' Besides the above, for historical purposes the following parliamentary papers may be found useful: 'History of the earlier years of the National Debt from 1694 to 1786' (C. 9010), and 'Proceedings of the Commissioners for the Reduction of the National Debt from 1786 to 1890' (C. 6539); local authorities' liabilities (No. 306 of 1903); 'Reports of and Evidence taken by the Royal Commission of 1897 on Local Taxation.' Among general works on finance dealing pre-eminently with British conditions C. F. Bastable's 'Public Finance' (3d ed., 1903), is the most complete and gives plentiful references to earlier works; G. Armitage-Smith's 'Principles and Methods of Taxation' (1906) may be useful to anyone requiring less detail. For the history of taxation, consult Stephen Dowell, 'History of Taxation and Taxes in England' (2d ed., 1888); Cannan,

'History of Local Rates in England' (2d ed., 1912), and William Kennedy, 'English Taxation 1640-1799, an Essay on Policy and Opinion' (1913).

EDWIN CANNAN,

*Professor of Political Economy in the University of London.*

**21. BANKING.** Banking in Great Britain as now carried on is the product of a continuous process of evolution; it owes very little to external influences, and can only be properly understood in the light of the study of its earlier developments. Its strength is the strength derived from long tradition founded upon experience, and its weakness is the weakness inherent in a system which has developed with the smallest possible amount of legislative control. This weakness is shown in a lack of logical coherence and in an occasional absence of proper definition.

There are few evidences of banking in the modern sense of the term in England before the 17th century. In the Middle Ages the bankers were mainly money changers and money lenders; they dealt in coin, not in credit. The Italian colony of the Lombards, however, who gave their name to Lombard street, seem to have been well acquainted with the use of bills of exchange, and the banking business of the country was chiefly in their hands after the expulsion of the Jews at the end of the 13th century. During the 16th century, however, the power of the colonies of foreign merchants in London rapidly declined, ending in the breaking up of the German colony in the Steelyard by Queen Elizabeth. In the 17th century it became customary for the wealthier classes to intrust their spare cash to the keeping of the London goldsmiths, a body of men whose occupation inspired the necessary confidence. The transition from goldsmith to banker was a natural and easy one, and the goldsmiths' "cash notes" gradually acquired a degree of negotiability. Some of the existing London private bankers find their origin in the goldsmiths of the latter half of the 17th century. Outside London the early type of country bankers was evolved from the class of substantial merchants. Thomas Smith of Nottingham, for instance, who is the earliest country banker of whom we have any record, and who certainly carried on business as early as 1688, originally combined the business of a mercer with that of a banker.

Owing to the unsatisfactory condition of the public finances under the Stuarts, there was no opening for a public bank such as existed in Amsterdam and other European centres of industry. But the Revolution of 1688 saw the control of the national expenditure pass from the Crown to Parliament. The national credit became, for the first time, an important factor in our economic development, and showed itself in the growth of a national debt. The use of credit spread rapidly and this led to the development of modern banking. To the efforts of William Paterson was due the establishment in 1694 of the Bank of England, founded under the wing of the Chancellor of the Exchequer, Charles Montague, with the object of lending the whole of its capital, £1,200,000, to the state.

**The Bank of England.**—The Bank of England is the pivot round which centres the whole of modern banking in the United Kingdom.

In no other country, whether in Europe or America, does a bank occupy quite an analogous position. It is not a state bank in the strict sense of the term; its capital is held privately, and its management is not in any way directly or indirectly controlled by the state. On the other hand, during its whole history, it has been more or less under the protection of the state; its operations have been on occasion dictated by the state; its development has been marked by successive loans of its capital to the state in return for the confirmation or extension of its privileges, and it still continues to exercise powers and owe responsibilities delegated by the State.

The Bank of England is controlled by a governor, deputy-governor and a court of 24 directors who are elected by the proprietors on the nomination of the directors. The selection is generally made from the members of leading mercantile firms, and the tradition is not to elect a member of a banking firm or a director of another joint-stock bank. The operations of the bank are now regulated by the Bank Charter Act of 1844. This act divides the Bank of England into two departments, the Issue Department and the Banking Department. The former, as will be seen in a later section, is so strictly regulated by the act that its action is automatic. The latter is for all practical purposes as free from legal restrictions as any other joint-stock bank. Yet free as it is from special legal obligations, it has, by its action in the past as well as by its present position, assumed peculiar responsibilities, which, though ill defined, are well understood, and which the bank does not attempt to disown. These responsibilities are due especially to the bank's position as the government banker, the bankers' banker and the keeper of the country's reserves. The government accounts are kept by the Bank of England, the national debt is managed, exchequer bonds and treasury bills are issued and paid, and many other incidental services of the kind are rendered by the bank. With regard to the other banks, all the settlements at the London Bankers' Clearing House are made by transfers at the Bank of England, where each clearing bank is bound to keep an account. Those banks which do not possess a seat in the Clearing House find it necessary to appoint one of the clearing bankers as agent and to keep an account with that agent. Practically every banker in England can, therefore, draw either directly or indirectly upon the Bank of England and the reserve of the latter has thus to be regarded both as the banking reserve of the country, and also as the gold reserve, that is to say, the reserve to insure the convertibility of the note issue.

Appended is a copy of a weekly return of the Bank of England:

#### BANK OF ENGLAND

AN ACCOUNT, pursuant to the Act 7th and 8th Victoria, cap. 32, for the Week ending Wednesday, the 25th day of October 1916.

ISSUE DEPARTMENT	
Notes issued...	£72,628,275
Government Debt	£11,015,100
Other Securities	7,434,900
Gold Coin and Bullion	54,178,275
Silver Bullion	.....
<b>£72,628,275</b>	<b>£72,628,275</b>

#### BANKING DEPARTMENT

Proprietors' Capital	£14,553,000	Government Securities	£42,187,852
Reserve	3,171,954	Other Securities	.....
Public Deposits (including Exchequer, Savings Banks, Commissioners of National Debt, and Dividend Accounts)	52,543,213	Notes	102,442,757
Other Deposits	112,171,721	Gold and Silver	35,942,255
Seven Day and other Bills	18,167	Coin	1,885,191
<b>£182,458,055</b>		<b>£182,458,055</b>	

Dated the 26th day of October, 1916.

J. G. NAIRNE,  
Chief Cashier.

**The Private Bankers.**—During the 18th century all the banks in England, with the exception of the Bank of England, were private partnerships, the number of partners being limited by an act passed in 1708 to six. Now, however, private banks are very few in number, and their influence is a diminishing one, though at one time that influence throughout the country was great, both socially and politically. The London private bankers ceased to issue notes toward the end of the 18th century, but the country private bankers attached great importance to their note issues up to the time when the Bank Charter Act of 1844 made further extension in this direction impossible. Many of these firms were under-capitalized; the banker was often a tradesman as well, and was too much at the mercy of fluctuations in trade. Consequently in time of monetary stress failures were frequent, especially during the early half of the 19th century. Except that their note issue is limited by the Act of 1844, the law imposes no restrictions upon private bankers, and they are not even compelled to issue balance sheets, though in most cases this has been voluntarily done of recent years. In spite of this absence of control, the existing private banks inspire a confidence which seldom proves misplaced. Most of them have been established for many years, for it has proved increasingly difficult for a new private bank to obtain a footing in the country. All banks possessing more than 10 partners must now register as a company under the Companies Acts.

**The Joint-Stock Banks.**—Owing to a clause in the Bank Charter Act of 1708, joint-stock banking was not possible during the 18th century, but in 1826 the Bank of England monopoly was so far curtailed as to allow joint-stock banks to be established, with the right of issuing notes, provided they had no office in London or within a radius of 65 miles. By an act passed in 1833, joint-stock banks were permitted within this radius, provided they did not issue notes, and under this act several of the leading joint-stock banks of to-day were founded. The legal disability to issue notes continues until the present day, and has had a marked effect on banking in England. The energies of the joint-stock banks have naturally been centred upon the development of deposit banking, with the result that the habit of keeping a banking account has spread more rapidly and more generally than in most countries, and the use of notes has correspondingly decreased. Practically all the existing joint-stock banks have

registered under the Companies Acts with limited liability, and in most cases with a reserve of uncalled capital which cannot be utilized except in case of liquidation. During the last 30 years or so a decided tendency has shown itself, on the one hand, for the amalgamation of the private banks and the smaller joint-stock banks with the more powerful of the latter class, and on the other hand for the spread of branch banking. This has resulted in an increased centralization of the banking system in London, and to a lesser extent, in a few of the leading provincial towns, and in the evolution of a system which is in distinct contrast to that existing in the United States of America. The natural consequence is that the magnitude and importance of the individual bank has very greatly increased. Yet, large as the liabilities of the leading banks to the public are, their capital, both nominal and paid up, and their reserve funds, are sufficiently ample to remove any feeling of distrust which might otherwise be inspired by the volume of their obligations, as will be seen from the accompanying figures taken from the balance sheets of a few of the most important joint-stock banks.

DATE	Bank	Subscribed capital	Paid-up capital	Reserve fund	Current and deposit accounts
Dec. 31, 1915	Lloyds Bank Ltd.	£31,304,000	£5,008,000	£3,600,000	£130,017,000
"	London City and Midland Bank, Ltd.	22,948,000	4,781,000	4,000,000	147,751,000
"	Union of London & Smith's Bk. Ltd.	22,934,000	3,555,000	1,150,000	46,080,000
"	London County & Westminster Bk., Ltd.	14,090,000	3,500,000	4,000,000	106,930,000
"	National Provincial Bk. of England, Ltd.	15,900,000	3,000,000	2,000,000	81,590,000

The *Journal of the Institute of Bankers* publishes annually a statement of the capital, reserve funds, deposits and other liabilities and assets of the British joint-stock banks and such private banks as published accounts. These were summarized in the issue for May 1916 as follows:

Bank notes have been in England largely superseded by the general use of checks by the public, and the demand for an elastic currency has never assumed such proportions as in the United States. In times of stress, however, the demand for notes has, in a few instances, exceeded the bank's power of issue, and on four

	Paid-up capital	Reserve funds	Deposit and current accounts
15 Clearing Banks	£36,338,000	£25,510,000	£834,989,000
19 Country Banks	11,551,000	7,076,000	168,218,000
4 West End Banks	1,635,000	171,000	16,507,000
9 Irish Banks	7,309,000	3,353,000	77,725,000
8 Scotch Banks	9,227,000	7,003,000	140,977,000
20 Australian Banks	22,028,000	15,391,000	218,532,000
6 Canadian Banks	11,827,000	11,224,000	157,481,000
6 Eastern Banks	5,201,000	6,898,000	80,608,000
3 Egyptian Banks	13,810,000	1,994,000	15,860,000
3 African Banks	4,931,000	2,735,000	47,569,000
4 South American Banks	6,300,000	5,800,000	44,521,000
9 Other Foreign and Colonial Banks	5,262,000	940,000	11,840,000
106 Totals	£135,419,000	£88,095,000	£1,814,825,000

Foreign and colonial banks having London offices are, it should be noted, not included in the above tables.

**Note Issues.**—The Bank Charter Act of 1844, which governs the note issues of English banks, aimed at the eventual extinction of all note issues except that of the Bank of England. This aim has now almost been realized, for at the beginning of October 1916 only nine banks possessed the right of issuing notes, the maximum authorized issues amounting to but £334,820, and the actual circulation being £121,329. By this act the Bank of England was authorized to issue from the Issue Department £14,000,000 of notes, covered by government securities, £11,015,000 of which consisted of the government debt to the bank. This fiduciary issue could be increased, if authorized by an Order in Council, by the addition of two-thirds of the authorized issue of any other bank which forfeited its right of issue or allowed it to

occasions, in 1847, 1857, 1866 and on the outbreak of the European War in August 1914, the government has been compelled to intervene and suspend the clause forbidding the issue of notes beyond the fiduciary limit, except against the deposit of gold. Bank of England notes, which it may be noted are legal tender in all payments except by the bank and its branches, are not issued for any sums below £5, though proposals have frequently been made, notably by Viscount Goschen in 1891, to authorize the issue of £1 notes. Since the outbreak of war in 1914 £1 and 10 shilling currency notes have been issued by the British treasury; they are legal tender and convertible into gold on demand at the Bank of England. The amount in circulation on 4 Sept. 1918 was £270,352,568 in currency notes and certifi-

cates. Against these the sum of £28,500,000 was held in gold.

**The Clearing System.**—The system of collecting checks and settling balances owing between bankers, though to the uninitiated it may appear merely an administrative detail, has, in reality, exercised a very important influence on banking development in England. The problem of clearing checks is comparatively simple compared with the problem as existing in the United States or any other country occupying a large geographical area, because practically every English bank or branch bank is within a day's post of London. Consequently although local checks are cleared through local clearing houses in some of the larger towns, the great mass of checks is cleared through the London clearing house, and this fact has very much accentuated the centralization of banking in London, which is the predominant characteristic of the English system. A seat in the clearing house is a privilege jealously guarded and difficult to obtain, and it was not until 1854 that any of the joint-stock banks were admitted. Those banks which do not possess this privilege appoint a clearing agent, with whom an account is kept and who in many cases acts generally as the London agent. By the rules of the clearing house every clearing bank must keep an account with the Bank of England, and the daily differences are settled by means of transfers to and from these various accounts and a central account called the clearing bankers' account.

The total amount of the checks and other articles cleared through the London bankers' clearing house in 1913 was £16,436,404,000, being the highest total recorded in the history of the house. The number of banks possessing seats in the clearing house is now 17, inclusive of the Bank of England.

**The Money Market.**—The London money market is the name given to the miscellaneous body of persons who borrow or lend money for short periods, their operations being roughly grouped around Lombard Street, Threadneedle Street, and the adjoining part of the city of London. The money in which they are interested is sometimes described as the short loan fund of the money market. On the one hand is the borrowing portion of the market, consisting largely of the bill brokers, the stock exchange and an undefined group of financiers; on the other, the Bank of England, which is closely connected with the money market, and which, owing to its position as the guardian of the ultimate cash reserves, is also the ultimate lender when money cannot be easily borrowed elsewhere. In between these two extremes are the clearing banks and other banks having London offices, as well as various financial firms, whose surplus unemployed assets form the principal part of the short loan fund. The British government also plays a very important part as a borrower in the money market, and the government of India, through the India council, lends largely to the market. Besides these, there is a group of foreign banks with London offices which exercise a growing influence in the market, both as borrowers and lenders.

The index to the general condition of the market is the bank rate, which is the official minimum rate at which the Bank of England

discounts first-class bills offered to it. All bills so offered for discount must mature within not more than three months and must be accepted payable in the United Kingdom and bear one other English signature. The Bank of England is actuated in fixing the amount of the bank rate by the state of the reserve and the prospects of an inflow or outflow of gold, and speaking generally, the bank is interested in keeping the rate as high as expediency will allow. The borrowing portion of the market is naturally anxious to keep the rate as low as possible. If, however, there is plenty of money to be lent outside the Bank of England, the bank rate cannot be effectively maintained at a much higher figure than the market rate, otherwise it would be merely nominal. Therefore, the other London banks to a large extent hold the balance between the Bank of England and the borrowing portion of the market. They are actuated on the one hand by the necessity of employing as large a proportion of their surplus assets as prudence will allow, and on the other by the responsibility of keeping reserves well above the margin of safety. The relations of the Bank of England to the other banks are of the utmost importance and interest. It is possible that in seasons when money is plentiful, the enormous floating balances available for employment in the money market may expose the Bank of England to the danger of a drain of gold. This risk is accentuated by the fact that the funds controlled by the joint-stock banks are far larger than those of the Bank of England. The bank must, therefore, be able to control the market rate should necessity arise, and it must do this by itself coming forward as a borrower (mostly through a broker) and by offering such a rate as to divert the loanable funds of the other banks away from the market. The latter, thus being denuded of funds, is driven to the Bank of England.

**The Gold Reserves.**—London is recognized as the world's central market for gold and yet her reserve stock of the metal is, notwithstanding the enormous volume of her financial dealings, at time actually less than that of her principal rivals. It is one of London's most cherished traditions that she puts no obstacles in the way of the export of gold, except making it more worth the while of its owners to keep it there. It may be mentioned that more than 60 per cent of the annual production of the world's gold is derived from British possessions.

That London can work on such a small basis of gold is due in the first place to the fact that the English system of a single centralized reserve is a more economical one than the system prevailing in countries where centralization is less developed; secondly, to the smooth working and thorough organization of her banking system, and thirdly, to the excellent reputation of English credit among other nations, which enables her to attract gold from abroad with the least possible delay. But there is a growing feeling that there should be more gold held in reserve in the country; not that bankers are thought to be working below the safety limit, but because the necessity for incessant vigilance results in unstable rates of interest with a consequent derangement of the money market and an undue accentuation of the speculative element in business generally. This feeling has

been especially prominent since other countries have adopted a gold standard, and many schemes for an improvement of these conditions have been brought forward. The settlement of the question is rendered more difficult by the dual nature of the Bank of England reserve, which is at the same time a currency reserve and a banking reserve. It is felt that the responsibility of keeping the former belongs partly to the State; that of the latter to the banking community; and the adjustment of the responsibility has not proved easy.

**Banking in Scotland and Ireland.**—Both in Scotland and Ireland banking has developed on slightly different lines from those of English banks. In Scotland especially the absence of any joint-stock monopoly like that of the Bank of England resulted in the early evolution of a type of powerful bank which crowded out the private banker. Consequently to-day there are only eight banks in Scotland, all with a large number of branches, and the establishment of a new bank is practically impossible. The Scotch people were early in recognizing the advantages of a good banking system, and the use of "cash credits" had an important effect upon the industrial development of the country. In Ireland, banking has had a stormier history, but similar results have been reached, and there are now only nine banks of any importance in the country. Both Scotland and Ireland differ from England in enjoying a circulation of £1 bank notes, which have survived all attempts at extinction.

The note issues of the two countries are governed by Bank Acts passed in 1845, which bear a close resemblance to each other. All the banks in Scotland and six of the Irish banks are banks of issue, and each is allowed to issue an amount equal to the average circulation during the year ending 1 May 1845, together with an amount equal to the amount of gold and silver coin held at the head office or principal places of issue, the silver coin not to exceed one-fifth of the whole. The Treasury was given power, during the European War, to permit issues in excess of these limits. The necessity for keeping coin against excess issues of notes brings the Scotch and Irish banks into close relation with the Bank of England. Neither the Scotch nor Irish banks clear their checks through the London Clearing House, but through the clearing houses of Edinburgh, Glasgow and Dublin, hence the connection between these banks and the Bank of England is not necessarily so direct as in the case of English banks. But there are certain recurrent seasons of the year when an increase of the note issues always occurs in Scotland and Ireland, and this necessitates an increase in the stock of coin. As there is no central reserve of gold in Scotland and Ireland, this coin can only be obtained from the Bank of England, and therefore, at these seasons of the year, notably during what is called the autumn drain, the Bank of England reserve is always subject to a demand for coin from these countries, especially from Scotland.

**Banking Methods.**—British banking methods are distinguished by prudence and caution. The immense amount of their deposits repayable on demand forbids English banks to embark upon the general financial business which forms the principal function of some Con-

tinental bankers. English banks do not operate on the Stock Exchange except for purely investment purposes, and then only in what are termed "gilt edged" securities. Neither do banks directly interest themselves in the control or management of commercial or industrial undertakings. Furthermore, the management of the large banks is singularly free from political interference of all kinds. On the other hand, English bankers have allowed to slip from their control many branches of business which belong legitimately to a banker. Much of the bill-discounting business is in the hands of the bill broker, who is an expert middleman between the banker and his customer. Until the last few years the business of foreign exchange was left almost entirely in the hands of specialists, or of the branches of foreign banks established in London. Most of the large joint-stock banks have, however, now opened foreign departments and are endeavouring to bring under their own control this branch of banking.

Attempts have been made to induce the English banks to undertake a more "adventurous" type of banking, more akin to that prevalent over the whole of the European continent, but English bankers consider it unsound banking, in view of their large liabilities to pay on demand, to share the direct trading risks of their customers. It has lately been suggested that a new type of bank should be founded to undertake financial risks in support of trade which the existing type of bank decline, and that the characteristics of such new type should be that it should possess a large paid-up capital and that the acceptance of deposits repayable on demand should be restricted or forbidden. An institution of this type has been established under the title of the British-Italian Corporation with the object of promoting closer trading relations between Great Britain and Italy, and a committee of the Board of Trade, with Lord Farington as its chairman, has recommended the establishment of a British trade bank with a capital of £10,000,000 which, without coming under government control, should receive as much official recognition as possible.

The liabilities of English banks consist almost entirely, first, of the current account balances in their hands, repayable on demand, on which it is not usual to allow any interest, and secondly, of sums deposited repayable at a fixed notice, usually seven days, on which London bankers allow interest at one and a half per cent below the Bank of England discount rate. London bankers also accept, on behalf of their customers, bills drawn from abroad, proper security being deposited to cover the bankers' liability. Their assets consist of cash on hand and at the Bank of England or their London agent, money lent at call or short notice to the money market against security, bills, being the acceptances of other bankers or leading merchants bought in the market, investments in first-class stock exchange securities, and advances to customers, either in the form of loans, overdrafts upon current account, or bills discounted.

During the middle of the 18th century, England was subjected to a series of acute banking crises, notably in 1847, 1857 and 1866, but if we except the grave situation created in 1890 by the liquidation of Barings, who, it must be

noted, were not bankers, the country has been free from such disturbances since 1878.

The outbreak of the European War in August 1914 threw a heavy strain on the banking systems of all countries, neutrals as well as belligerents. It is as yet too early to discuss the lessons which may be learned from the experience gained since that time, but it may safely be said that the British banking system has stood the ordeal well. The worst criticism that has been levelled against it is that bankers displayed a lack of courage in the early days succeeding the declaration of war. Two or three circumstances stand out clearly; first the strength, unexpected in the circumstances, of London's international position at the outbreak of war, when instead of the gold famine expected by some, gold poured into London from all quarters. Secondly, the advantage to the country of having its banking resources liquid instead of locked up in trading ventures, whereby the maximum financial assistance has been forthcoming for carrying the country through the ordeal of the war. Thirdly, the vigor and efficiency displayed by the Bank of England as the pivot of our whole banking system.

Secretary of the Institute of Bankers, and of the Central Association of Bankers.

## 22. COMMERCE—18TH CENTURY.

—English commerce of the 18th century is remarkable for the revolution in the methods by which it was carried on, for its growth under the great Whig system of protection and for its culmination in a tremendous expansion with the coming of machinery. English foreign trade had been largely opened out by merchant companies. The foundation idea was that English goods should be sold at a high price and that there should be no glut of goods, no undercutting, but a "well ordered trade." Hence rules as to quantities to be exported were a great feature of these companies. There was no idea of pushing trade or selling at a low price and getting quick returns. Moreover, the numbers admitted to the companies were limited by the high fees charged for entrance, while no one who did not belong to them could lawfully engage in the trade. The only open trades were those to France, Spain and Portugal. Hence a regular attack on the monopoly of the companies was carried on and this constituted the early free trade movement. It was successful; after the Revolution the entrance fees of the companies were reduced by Acts of Parliament; only the East India Company and the Hudson's Bay Company continued strict monopolies. With the throwing open of trade it was possible for an enterprising man to carry on commerce on any scale, to push his wares and generally increase his sales wherever he could without limitation of any kind. This amounted to a veritable revolution in commerce. Alongside of this opportunity for expansion came the emigration of the Huguenots into England. Besides introducing many new industries such as silk, cotton printing, paper and linen, there was no branch of English trade which they did not improve with their taste and skill. Hence England had a more varied assortment of goods with which to push her trade. Moreover, the Huguenots preserved their old business connections, and England inherited in this way a great deal of the French trade.

At the Revolution of 1689 the control of economic affairs definitely passed to the House of Commons, and the Whig party became the arbiters of national policy. The Tories were inclined toward "free trade." They believed in favoring the consumer and in removing restrictions on intercourse, especially with France, the chief industrial rival of England. The Whigs on the other hand held very decidedly to a policy of encouraging industry and in so manipulating commerce that it should react on the prosperity of industry. Hence they devised a system of bounties for encouraging the exportation of silk, linen and corn. Bounties were also given to the fishing trades. They tried to

stop the growth of competing industries in both Ireland and the colonies, and when Scotland showed signs of becoming a rival the Union was brought about.

In their fiscal policy and in their trade treaties the same Whig ideas were carried out. We first see them applied in the commercial relations between England and France. England's great industrial competitor at the end of the 17th century was France. Colbert had been doing everything in his power to encourage French industry and had gone so far, in 1667, as to put prohibitory rates on English cloth. Englishwomen with (to the masculine mind) an extraordinary perverseness would insist on wearing French goods when they could get them. Hence, according to the opinion of the day, to shut out French goods was to assist English industry in the best possible way. To this the Tories were opposed, but the Whigs were successful, in 1678, in carrying an Act prohibiting trade and commerce with France. A system of high duties was substituted for prohibition under James II, but the Whigs returned to the early policy. In 1713 a clause was added to the Treaty of Utrecht to the effect that England should admit French goods as in 1664. This gave rise to a tremendous controversy. Again the Whigs were successful; the commercial clauses of the treaty were not carried out, and the policy of protecting English industry by cutting off trade with France was not reversed till the treaty concluded by Pitt in 1786. By that time England no longer feared French competition and English manufactures were so much sought after in France that there was a tremendous outcry on the part of French manufacturers.

The Whig desire to shut out competitors extended to another department of commerce, namely, the trade with India. The East India Company had been bringing back silks and muslin and cotton goods which were worn by the "greatest gallants" as well as by "the meanest cook maids" instead of good English cloth. Hence employment was being diverted from Englishmen to Hindoos, and in 1700 an act was passed by which East India goods might be warehoused for re-exportation, but they might not be sold within the country.

But it was not enough to shut out possible competitors. Definite encouragements to English trade were given by the Methuen Treaty negotiated with Portugal in 1703, and by the Asiento Contract obtained from Spain in 1713. The Portuguese had prohibited the importation of English cloth, and in 1703 Mr. Methuen was successful in getting this prohibition removed on condition that Portuguese wines were admitted into England at two-thirds of the duty on French wines. The trade with Portugal thus opened up was reckoned to be a very large one, and was especially cherished since a large part of the returns was paid in Brazilian bullion, with which we could renew our depreciated coinage.

By the Asiento Treaty the Whigs got a large part of the slave trade with Spanish America into their hands. They obtained the right to import 4,800 negroes annually and to send one vessel of 500 tons to import goods into the Spanish colonies. The West Indies became a great depot for this trade and under the cover of the one ship the English got possession of

much of the Spanish-American trade. From every point of view the slave trade commended itself to the general opinion of the time. It encouraged shipping, promoted trade with Africa — which country took English cloth in payment for slaves — it supplied labor to the West Indies and Virginia and helped the agricultural development of the colonies. Moreover the slaves were a means of carrying on trade with Spanish-America. But from the English point of view the economic effects were still more important. As long as the colonies had slaves they would never take to manufacture, the negro being incapable of the necessary training. The colonies would continue therefore to grow the tropical commodities for England to distribute.

Sir Robert Walpole began to reform the fiscal system with the same object of stimulating industry through commerce. Accordingly he overhauled the book of rates between 1721-24 with the object, to use his own words, of making "the exportation of our own manufactures and the importation of the commodities used in the manufacturing of them as practical and easy as may be." He repealed or reduced the import duties on raw materials and arranged for manufactured exports to be duty free. He next began to try and stimulate the warehousing trade which the Navigation Acts (see NAVIGATION ACTS, article 24) were partly designed to create. He hoped to make England "one general free port and a magazine and common storehouse for all nations."

This system of deliberately building up English industry was continued until the time of the younger Pitt, who, following out the Tory tradition of free intercourse, not merely reopened trade with France but tried to carry free trade between England and Ireland, unsuccessfully however, owing to the hostility of the English manufacturers. He also wished to allow American ships to trade freely with England and the West Indies in spite of the Navigation Acts. But, this Tory reversal of the Whig policy was doomed to failure.

The French wars prevented any relaxation of the system for revenue reasons, and it was not until 1846 that the great breach with the Whig policy of the 18th century was definitely made.

During the 18th century English commerce steadily increased in almost every direction, especially with the colonies. In 1699 the exports had been estimated at £7,302,716. By 1720 they were £8,681,200 and by 1740, £11,469,872. In 1760 the figure had reached £15,579,073; in 1771, £17,161,146; while with machine products the total reached £34,381,617, in 1800.

The imports in 1699 were £3,482,586; by 1720 they had nearly doubled, being £6,090,083. In 1760 they were £9,832,802; and in 1771 had reached £12,821,995. In 1800 they were £28,257,781.

It is exceedingly difficult to say whether this increase was a result of the Whig policy or no, but the fact remains that while they held the reins of power English trade extended as they intended it should, and thus prepared the way for the introduction of machinery. It was not accident that the industrial revolution (see GREAT BRITAIN — INDUSTRIAL REVOLUTION) occurred in England when it did. At the Restoration English industry was very backward;

English agriculture undeveloped; and English commerce small. By the end of the 18th century England, in spite of the loss of her American colonies, was the greatest trading country in the world. Her goods, through sheer cheapness, were forcing their way into every country. She was the great carrier of the world, and the only people that could compete with her were the Americans, whose shipping had grown up under English protection. She was able to withstand, by her wealth, the great financial strain of the French wars, and to control the access of colonial produce to Europe.

That many mistakes were made is no doubt true, and Adam Smith did not hesitate to expose them; but the objects which the Whigs had at heart were attained to an extraordinary degree during their tenure of power.

LILIAN KNOWLES,

*Lecturer in Modern Economic History, London School of Economics and Political Science.*

**23. BRITISH COMMERCE. Volume of Trade.**—It has been estimated that nearly a fifth of the working population of the United Kingdom depends for existence on the sale of its products in foreign markets; add to this the classes engaged in ocean transport, in market organization and financial settlements, and it is possible to arrive at some conception of the magnitude of the interests involved and the importance assigned in the United Kingdom to overseas commerce. Parliament and the Press never tire of the theme. Not merely the Board of Trade, but all other great departments of administration, whether concerned with defence, revenue, foreign and colonial affairs, or education, find themselves involved in one way or another in the consideration of the interest of international commerce. So far, indeed, has been carried this exclusive attention to external relations, that the existence of a home market is not seldom forgotten or ignored. Some ground for this forgetfulness may be found in the great value of the foreign trade—over £7,000,000,000 imports and exports in 1913, the last normal year before the war—in relation to a limited population and area; but its real importance in the economy of the United Kingdom appears only on a further analysis of the figures.

Of the imports, valued at £769,033,959, three-fourths must be credited to food and raw material, the rest to manufactures of various kinds. The exports are made up of £525,461,416 of British produce and £109,655,718 foreign and colonial re-exports. Manufactures constitute the mass of British produce exported, with one important exception—coal.

The figures imply much that is interesting both in past history and present organization. A country of restricted area and resources obtained, through various economic and political accidents, a start in the industrial race a century ago. Some of the necessary raw materials of industry it cannot produce, of others the quantity is insufficient for its growing demands. Increasing specialization leads to greater dependence on certain types of foreign imports and greater need for a market abroad for the constantly increasing surplus of manufactures. Food, too, must be brought from more favored regions, and the very success of manufactures breeds a natural tendency to neglect the interest of agriculture; though native resources, utilized to the utmost, would still be insufficient, in the present state of agricultural science, for the needs of the growing industrial population. The basis of the present system, and the only home product, on a large scale, which is more than sufficient for the needs of the moment, is coal. Hence it is exported from those districts where it is not utilized in local industries, and where access to the sea is easy; its ultimate functions being to provide power for British and foreign shipping or for foreign factories.

The entrepôt business, in foreign and colonial produce, again represents a historical advantage. It is a relic of the partial monopoly of the carrying trade, and the control of the supply of tropical, eastern, and colonial commodities to continental markets, long enjoyed by the United Kingdom. Though aided by the principle of inertia, and the facilities of old-established commercial centres, such business has not increased at a rate proportional to the general movement of trade; in fact, for a long period it was stationary at about £60,000,000, though recent years have witnessed a great improvement. This slow rate of growth is due mainly to the development of continental shipping and the establishment of direct relations between the European consumer and distant markets, which have been conspicuous features in the elaboration of international commerce during the last generation.

The last point noteworthy in the general figures, is the vast difference between the value of imports and exports. Apart from minor questions of statistical method, the excess of imports represents two main facts: firstly, returns for the service of some 11,000,000 tons of foreign-going shipping, which carried nearly the whole trade of the United Kingdom and no inconsiderable portion of that of the rest of the world; secondly, payments of interest by debtor nations and foreign industries to the great creditor nation of the 19th century, or in some cases, perhaps, the redemption or creation of capital liabilities.

**Classification and Distribution of Imports.**—The close relationship between foreign commerce and internal organization is best seen by tracing commodities from their sources or following them to their destination within the country. For this purpose much of the United Kingdom can be removed from the map. A small fragment of Scotland, a single port in Ireland, the north and part of the midland and west of England, with London and its subsidiary ports cover the whole region of industrial and commercial importance. Lon-

don, including the minor ports from Harwich to Southampton, receives about 40 per cent of the total imports of the United Kingdom. Of this vast trade, food, in one shape or another, accounts for nearly half; fruit, eggs, vegetables, butter and other minor agricultural products, with large supplies of beet sugar, from the neighboring districts of Europe; grain and meat from more distant countries; tea, coffee, rice and miscellaneous tropical and sub-tropical products; all are poured in to supply the needs of the dense population of the London area, or to be distributed over the lines of communication radiating northward and westward.

Apart from food, the most important items of note in the statistics of London and its subsidiary ports are the silk, woollens and other textiles consigned from France and other parts of the continent. In this matter London appears as the great consumer of luxuries; on the other hand the receipt of raw wool from distant parts of the world to the value of some £37,000,000, and of large quantities of tin from the East, shows her as a controller of markets and distributor of commodities which she does not utilize herself. For the rest, the trade is made up of innumerable minor manufactured articles, chiefly from European countries, and of miscellaneous raw materials from every region of the world, partly for use in the many industries of the London area, partly attracted thither by facilities of transport and marketing.

The only group to compare with London consists of Liverpool, with the Mersey ports, now including Manchester. Together they take another 30 per cent of the total imports of the kingdom. Roughly, a third is staple food stuffs, mainly from across the Atlantic; Liverpool vying with London as a distributor of these commodities; another third is raw cotton, nearly the whole of the supply needed for native industries; while in the miscellaneous group, the cane sugar and tobacco of the Indies, the palm-oil, nuts and rubber of the African and American tropics are interesting reminders of the intimate connection of Liverpool with the older colonial and plantation trade.

The remainder of the import business is divided between the eastern group of seaports, represented by the Forth, the Tyne with Middlesbrough, and the Humber; and the western, represented by the Clyde, the Severn and Belfast. The main intercourse of the east coast is naturally with the continent of Europe, from the Baltic to the Black Sea; and, for the most part, it can be regarded as merely an extension of London for the receipt of continental goods. One commodity alone deserves special remark. Iron, in various elementary stages of manufacture, enters the Humber from abroad, while Middlesbrough and the Tyne find it necessary to import more and more foreign iron ore for their smelting industries. The native supplies, for certain purposes, show a distinct and unpleasant tendency to run short. On the west coast, the Clyde and Severn, like Liverpool, need food for the population concentrated on their coal areas, and have a small share in the sugar and tobacco of the plantation trade. Glasgow must look abroad for iron ore, Cardiff and South Wales for iron, copper and tin, while Belfast needs flax and linen yarn to supplement native supplies.

All ports alike, from London downward, absorb vast quantities of timber in various shapes. The native supply is a thing of the past; so northern Europe, North America and the tropics are called in to provide this necessary material for railways and mining, and above all for one of the greatest home industries,—building—an industry which does not figure in the export list but is none the less of vital importance in the general economy of the country. An annual timber bill of £33,000,000 is a fairly prominent item in the national balance sheet. For food, raw materials, luxuries, for nearly all the needs of civilized existence, the United Kingdom depends partly or wholly on supplies from beyond the seas; it is small matter for surprise that the question of safety of trade routes, on the one hand, and of the economic and political policy of the regions from which the necessary supplies are drawn, on the other, should loom larger and larger in the view of statesmen, as the economic dependence of the country steadily increases.

#### Classification and Distribution of Exports.

—As an outlet for those districts which produce the chief British staples, London cannot compare with Liverpool. Over a third of the total exports of British produce goes by way of the Mersey, only about a quarter by way of the London group. At Liverpool, cotton goods provide half the export, then come iron and steel in all stages of manufacture, large quantities of woollens, with textile machinery, chemicals and earthenware. In fact the main industries of Lancashire, Yorkshire, Cheshire and the Midlands are here represented roughly in order of their relative importance. With one or two qualifications, the foreign trade of Liverpool may be taken as a type of that of the whole kingdom.

The export business of the London group is less easy to define, partly owing to the many minor industries of London and district, partly owing to the modifying effects of cost of transport from the great producing centres. Textiles still hold the first place in the customs list, but large quantities of leather, millinery and apparel, paper and stationery, provisions, confectionery, pickles and medicines, suggest rather the minor activities of a great centre of population than the staple industries of modern life. In short, London may be regarded rather as a general store, handling every kind of goods and forwarding to all parts. The main activities are typical of commercial rather than industrial England.

The export trade of the east coast has certain peculiarities worth a moment's attention. Many million tons of coal leave the Tyne and Humber for European ports, while the textile industries are represented by yarns and machinery rather than finished goods. A certain amount of iron and steel, with ships and their machinery, completes the main features of the trade. The European markets, owing to their advance in industrial organization, tend to be accessible only to certain restricted groups of British industries; the changing conditions are reflected in the customs records of the eastern seaports.

On the west coast, a few million pounds worth of cotton, iron and steel, ships and machinery represent the industrial activity of the

Glasgow district; while the linens of Belfast, the iron, steel and tin plate of the Severn ports and £18,000,000 worth of steam coal from Cardiff complete the schedule of the chief British exports.

In the entrepôt business, London and Liverpool alone are worthy of notice. London is still the chief European market for wool, though her position has been affected by the increase of direct relations between Australia and the continent. But the supreme control of the world's tea trade has dropped from her grasp. The teas of China, whether destined for Europe or America, no longer fill her warehouses. In this, as in other less important departments of commerce, the development of commercial policy of the Powers in the Far East and more particularly the activity of their shipping, have gradually undermined those special advantages on which the great entrepôt trade was founded. London still remains a convenient market for miscellaneous tropical and colonial products, and this position she shares with Liverpool. Broadly speaking, the one looks to the east for imports, the other to the west; together they provide a collecting centre for minor commodities of the whole world. So long as British trade and shipping exist on their present scale, and London maintains its reputation in the financial transactions of commerce, this type of commission business is likely to persist, though it may represent a decreasing proportion of the total commercial activity of the country.

**Changes in Character and Sources of Imports.**—The ultimate destination of exports or the origin of imports may be a matter of indifference to the individual trader; but in a review of the whole movement of commerce, the question of sources of supply and markets for products is of the highest interest. In recent years there have been great changes both in the distribution of British manufactures exported and in the sources of the national food supply. Raw materials for the great industries have been affected to a less degree. A generation ago Europe vied with North America as an exporter of wheat and flour to the United Kingdom; at the close of the century her share had fallen from over 40 to less than 10 per cent. North America had annexed the trade, the larger share falling to the United States, though Canada was rapidly improving her position. India, the Argentine Republic and Australasia merely supplemented the deficiencies of this supply. But the situation has changed radically, in the last 10 years, through the enormous deficiency in the supply from the United States, coupled with a corresponding rise in that from India, the Argentine and Eastern Europe. Moreover, there are elements of permanence in the change. Apart from the fact that the United States may have considerably less to spare, in the near future, after the satisfaction of the needs of her own industrial population, there are evident economic advantages involved in the purchase of food supplies from those regions which, in their turn, provide an equivalent market for British manufactures. The imports of live cattle from Europe have also ceased, while a new trade in fresh meat with the most distant regions has been created under modern conditions of transport.

In spite of these changes there has not been that decrease in west-European imports into the United Kingdom which might have been anticipated. Though staple foods for export are only available on a large scale in the non-industrial eastern districts of Europe, the neighboring countries of the west still supply, for British consumption, large quantities of the minor perishable food products. Superior organization and better facilities for transport enable the small grower abroad to supply the great consuming centres with much that could readily be produced in agricultural England. Compensation has also been provided by the enormous growth in the import of beet-sugar, stimulated by the bounty system—a growth of many hundred per cent in 20 years. Since the abolition of the bounties by the convention which came into force in 1903 there has been a considerable decrease in the supply of beet-sugar from Europe, with an increase in that of cane-sugar from tropical regions; but it is impossible to forecast the ultimate position of equilibrium. Further compensation is to be found in the increasing volume of the stream of those continental manufactures which find a ready market in the United Kingdom. The net import of foreign manufactured goods, more than half of which are ready for consumption, has doubled in the last generation and was valued at upwards of £193,000,000 sterling in 1913. The greater part of this must be credited to the industrial regions of western Europe. Formerly one of the best markets for the British manufacturer, they are now reversing to some extent the earlier movement, and invade with success the British market, either supplementing or competing with the native industries.

In raw material the changes are less conspicuous. American cotton and Australian wool still dominate the market; but the tin for British industries is now largely imported from Malaya and Australia, while even for iron ore it is found necessary to utilize more and more the Spanish, Scandinavian and other foreign supplies. The import trade in raw material and food has one characteristic common to all its branches, that is the vastly increased distance from which commodities can be gathered and to some extent the multiplication of possible alternative sources. In fact, the need of an alternative, particularly when no native supply is available, has so impressed itself, not merely on the individual importer but on the great manufacturing interests as a whole and on many responsible officials and politicians, that it bids fair to give rise to a new type of commercial policy, in defence of the national economic interests.

**Foreign Markets.**—The question of a foreign market for British manufacturers raises more difficulties than that of the source of imports. As a general rule, the supply of the latter can be safely left to the foreign countries interested in their production; but British exports must seek out their market in the face of the world-wide competition. In this connection it is worth noting that the proportion of manufactures in the total exports of British produce to the chief protected foreign countries, fell in the last 20 years of the 19th century from 85 to 72 per cent. In the same period the total export of coal more than trebled, while the

number of the population engaged in mining shows a heavy relative and absolute increase. These two facts, taken together, are not without significance; though a proportion of the coal exported is accounted for by the enormous increase in the tonnage of British steam shipping engaged in the trade of the world.

Apart altogether from the effects of fiscal policy, the development of the industrial activities of Western Europe and the United States has necessarily narrowed the market for British manufactured staples. Both regions take a smaller proportionate share of British exports, while in the case of the United States there has been a heavy absolute fall, for which woollens and tinplate are largely responsible. The European trade has maintained its value and in some cases has shown a tendency to increase; but the type seems to be changing steadily; coal, yarn and machinery for continental industries tend more and more to take the place of finished goods. The census returns provide a valuable comment on the statistics of exports. Among the greater industries, iron and steel and their manufactures alone show an increase in the proportion of the population employed, comparable to that in mining. Woollens and other textiles show a large decrease. Cotton shows a slight increase in the total number but not commensurate with the growth of population. But allowance must be made for more efficient machinery and labor; while the activity of Lancashire during the last eight or nine years, as evidenced by the building of new mills and the greatly increased import of raw cotton and export of finished goods, suggests that the next census will tell a very different tale.

The cry for new markets and the "open door" is not without good foundation. In the West the United States has evident advantages; Germany, owing to her position and her land frontiers, is exceptionally favored for intercourse with the purely agricultural regions of Europe; while, in the Far East, Japan has started on an industrial career which compels her to import food and raw material rather than finished products. There remain as open markets China nearer Asia, South America and the British colonial possessions. The fact that staple British exports have found a rapidly expanding market in the self-governing colonies has masked the decline in other directions. How long the expansion will continue it is impossible to say; the colonies are not without their own individual aspirations, but it is likely to be long before their manufacturing capacity overtakes the demand of their vast agricultural populations. It is impossible to forecast the inevitable changes in international trade resulting from the European War.

Hitherto the British producer and merchant have risen superior to difficulties; ground lost in one direction has been gained in another, while competition has served as a stimulus to greater exertion, and in spite of fluctuations and temporary depressions, the volume of British trade has steadily increased; and this fact gives strong support to the view that the energy and adaptability of the United Kingdom, alike in the spheres of industry and commerce, are as yet far from reaching a limit.

The following statistical tables give a gen-

eral view of the progress of British trade for 10 normal years.

VALUE OF IMPORTS AND EXPORTS OF THE MERCHANDISE OF THE UNITED KINGDOM.\*

YEAR	Total imports	Exports of British produce	Exports of foreign and colonial produce	Total imports and exports
	£	£	£	£
1904	551,038,628	300,711,040	70,304,281	922,053,949
1905	565,019,917	329,816,614	77,779,913	972,616,444
1906	607,888,500	375,575,338	85,102,480	1,068,566,318
1907	645,807,942	429,035,083	91,912,084	1,165,755,109
1908	592,953,487	377,103,824	79,623,697	1,049,681,008
1909	624,704,957	378,180,347	91,344,819	1,094,230,123
1910	678,440,173	440,589,811	103,776,104	1,212,806,088
1911	680,157,527	454,119,298	102,759,134	1,237,035,956
1912	744,640,631	487,223,439	111,737,691	1,343,601,761
1913	769,033,959	525,461,816	109,655,718	1,404,151,093

\* The important difference between the system of the United Kingdom and other systems is that the former shows the values at the time of import and export, whilst in most other countries the prices are computed at the prices of a year or more before.

The average share per head of population in net imports (i.e., total imports less re-exports) for the same decade was distributed as follows:

1904—\$54.16; 1905—\$54.42; 1906—\$57.98;  
1907—\$60.80; 1908—\$55.86; 1909—\$57.52;  
1910—\$61.40; 1911—\$61.18; 1912—\$67.94;  
1913—\$68.74.

The principal imports on which customs duties are levied are beer and spruce, chicory, cocoa, coffee, dried fruits, motor spirits, spirits, sugar, tea, tobacco and wine—spirits, sugar, tobacco, tea and wine yielding the bulk of the entire levies, about \$170,000,000 per year.

**Bibliography.—Volume of Trade.**—The source of all ordinary information as to British trade is the 'Annual Statement of Trade with Foreign Countries and British Possessions,' supplemented by the 'Annual Statement of Navigation and Shipping.' The chief defect in the series is that until 1904 the figures represented ports from and to which the goods are shipped, and not countries of origin or ultimate destination. In other words, British trade relations, particularly with certain European countries, are entirely misrepresented. A supplementary volume is now issued which attempts to get at the real facts of the case.

**Exports and Imports, Distribution and Changes.**—Much valuable information as to the historical growth of British trade can be gathered from the 'Report of the Royal Commission on Trade Depression' (1886), supplemented by Parliamentary papers. The Parliamentary paper, 'Food Supplies Imported 1870-1902' (No. 179, 1903), gives in detail the changes in the sources of supplies in the period. The 'Report of the Royal Commission on Food Supply in Time of War' contains much miscellaneous information as to sources of imports, including raw materials.

A. J. SARGENT,

*Appointed Teacher of Foreign Trade in the University of London; Author of 'The Economic Policy of Colbert.'*

**24. NAVIGATION ACTS.** In the 17th century the independence of the English nation as a nation had been secured. Spain had been conquered at sea, and henceforth maritime

power became more than ever the great national ideal. Comparatively safe from the dominance of a foreign power, and her internal resources in process of rapid development, all the conditions were present for England to expand beyond the seas and to attempt to secure for herself that pre-eminent position in the world's commerce hitherto held by Holland. England's dominating purpose during the 17th century was to build up her foreign commerce, to out-rival the Dutch at every point, to constitute herself the great warehousing and distributing depot of Europe and to induce the colonies to contribute to the power of the mother country by growing commodities for her to re-export. When Scotland or Ireland seemed likely to encroach on the colonial trade they were carefully excluded.

All through the changes of dynasty from Charles I to the time of the Whig predominance the same idea holds good; and the instrument by which all this was to be effected was the series of Navigation Acts or Acts of Trade.

The Navigation Acts were no new thing in the 17th century. There was one as early as 1390 (5 R. II, St. I, c. 23). It forbade goods to be exported or imported by Englishmen except "in ships of the King's liegance." This act was inoperative, however, owing to the lack of English shipping, but the idea of the statute was never lost sight of. A similar act was passed in 1463 (3 Ed. IV, c. 1) but was dropped after three years. Efforts were again made to enforce a monopoly for English ships under Henry VII (1 H. VII, c. 8 and 4 H. VII, c. 10) and in 1540 the old laws were re-enacted, the freights defined, and inducements offered to aliens to use English ships. Elizabeth gave up the policy of confining English trade generally to English ships and by an act of 1563 (5 Eliz., c. 5) merely reserved the coasting trade.

In the 17th century the Navigation Acts were revived. In the early part of the century they took the form of royal letters and proclamations, but in the latter part the policy was embodied in the statutes of 1651 and the series of acts between 1661 and 1696.

From the 17th century till the final repeal of the acts between 1822 and 1854, the policy of confining English and colonial trade to English ships was consistently pursued.

The novel feature of the 17th century Navigation Acts did not lie so much in their continuous enforcement as in their enlarged scope and their application to the colonial trade. The Dutch being the greatest traders of the time had got the bulk of the English colonial trade into their hands by making advances to the colonists on the security of future crops. These they duly received when grown and distributed from Amsterdam. This conduct the English regarded as directly contrary to the whole object of colonization, the general view at that time being that people should only leave the mother country in order to build up English trade and shipping elsewhere.

The feeling of jealousy with regard to the Scotch was almost as strong. It is true that they were not such formidable rivals, but they were said to sail cheaper than the English, and as they had close trade relations with the Dutch it was feared that the latter might get hold of the English trade through the Scotch.

"The Plantations are His Majesty's Indies" runs a report of the Commissioners of Customs (30 Oct. 1661) "without charge to him secured and supported by the English subjects who employ above 200 saile of good English ships every year, breed abundance of mariners and begin to grow commodities of great value and esteeme." Were the Scotch allowed to trade freely on the same footing as Englishmen it would "in one word overthrow the very essence and design of the Act of Navigation."

The jealousy of both the Dutch and the Scotch was keenly felt in the 17th century. As soon as the plantations showed signs of development measures were taken, primarily against the Dutch, in order to secure the growing trade for England.

In 1621 we get the first of a series of orders and letters sent out by the King to the colonial governors with the object of having all colonial goods brought to England and brought in English ships. In 1624 a proclamation ordered that no tobacco should be imported in foreign bottoms. In 1629 another proclamation re-enacted the old navigation laws as to English trade generally. In 1633 the question of the colonial trade was referred to a committee who reported strongly in favor of confining such trade to English ships, and an order was accordingly issued to this effect. In 1637 letters were sent out to the governors in America and the West Indies ordering them to "strictly and resolutely" forbid all trade and traffic with the Dutch.

During the Civil War the Dutch seem to have got more and more of the trade of the English colonies into their hands, and it became necessary to revive the policy which had been pursued under Charles I. This was done in the act of 1651, which led to the Dutch war. The commonwealth wished to do a popular thing by appealing to the English hatred of the Dutch, and they no doubt also intended to give the ship owners some compensation for the overwhelming misfortunes which the Civil War had brought on them. The restrictions of the act were not new, nor was it enforced any more effectively than previous acts had been. Cromwell indeed did not believe in the policy, and so great was the danger to English shipping from the Spanish and Royalist privateers that the government was only too glad to see trade kept alive in neutral ships. In the colonies the statute seems to have been generally disregarded. In 1660 (12 C. II, c. 18) the act of 1651 was re-enacted with certain additions. The act of 1651 had declared that no goods "of the growth, production or manufacture of Asia, Africa or America" should be imported into England except in English or colonial ships. Goods from Europe might come either in English vessels or in the ships of the country which produced the goods. As Holland was not a producer she would be particularly affected by this provision. In the 1660 act the various clauses were made more precise. Both the import trade and the export trade of the plantations were to be carried in ships, English built, English owned and manned by a crew of whom three parts were English. By a later statute (14 C. II, c. 11) colonial shipping was put on the same footing as English for all the purposes of the Navigation Acts. Goods from Europe were subject to

the same restrictions as in the act of 1651, i.e., they might be imported either in English ships or in ships of the country of origin. No attempt was made to restrict the export of English goods to English ships except in so far as the plantation trade was concerned.

The policy of developing the warehousing trade through the Navigation Acts as outlined by Charles I was again taken up by his son. A number of commodities—sugar, tobacco, cotton, wool, indigo, ginger, fustick and dye-woods—were "enumerated," and could only be exported from the colonies either to England or to another English colony. Rice and naval stores were added to the list in 1706, and copper and beaver skins in 1722.

The act of 1663 (15 C. II, c. 7) further extended the policy of making England a great entrepôt by enacting that commodities of the growth or manufacture of Europe that were needed by the colonists should be shipped from England in English or colonial vessels.

Thus, according to the Navigation Acts, the bulk of colonial produce had to be brought to the mother country, and the colonists were bound to take their manufactures from her or through her.

It should be observed that by these acts the Scotch were shut out from the plantation trade and were not even reckoned as English for the purpose of making up a crew (13 & 14 C. II, c. 11) until the act of union. They petitioned to be allowed to trade with the colonies, but a commission reported strongly against it because such liberty would bring infinite loss to His Majesty's customs and "much prejudice" to the English.

As to Ireland, enumerated goods could be imported there, according to the act of 1660, and it seemed as if an Irish warehousing system might have developed since food was so cheap that many ships engaged in the colonial trade went into Irish ports to victual. English jealousy of Ireland was, however, too strong for her to be allowed to encroach on a province which England regarded as the foundation of her prosperity. An act was passed in 1670 (22 & 23 C. II, c. 26) by which the staple colonial commodities were henceforth brought to England only. In 1695 Ireland was prohibited from receiving even non-enumerated commodities as the Bristol merchants complained of the injury done to their trade.

After the Restoration, English shipping increased rapidly; but it is not easy to estimate the precise effect of the acts in building up the maritime power of England. The English mercantile marine doubled between the Restoration and the Revolution and continued to grow all through the 18th century. Petty, writing in 1699 ('Political Arithmetic,' pp. 258-259), said that shipping had increased three or four fold in the last 40 years; and Child ('Discourse of Trade,' 1695), chronicles the great increase of 'Wharfs and Keys' to accommodate the growing trade. It is exceedingly difficult to estimate the extent to which this increased prosperity was due to other factors as well as the Navigation Acts. The English had been pushing trade in all directions after 1660; Charles II had concluded a series of trade treaties which gave great openings to English merchants; the banking system was developing with increased facilities for traders; the old

system of a steady but restricted trade carried on by merchant companies was giving way to the new principles of pushing trade anywhere and by all means. All these things contributed to increase the demand for shipping. But without the Navigation Acts it might have been Dutch shipping that would have profited, since Holland carried at much cheaper rates than any other nation. At any rate the acts did secure that the increase of trade should benefit national shipping, although in the Baltic trades the results were at first disastrous. The English had not sufficient shipping for the trade, hence they could not get timber, and accordingly English ship building was hampered. It indeed became necessary to relax the restrictions as far as Norway and Sweden were concerned for three years (7 & 8 W. III, c. 22) to get in naval stores.

The policy of the acts was attacked as tending to increase prices and limit trade. But the answer always was "that this kingdom is an island the defence whereof hath always been our shipping and seamen," and that therefore "profit and power ought jointly to be considered," and Child, who thus anticipated Adam Smith in his doctrine that defence is more than opulence, added "I think none can deny that the Act of Navigation hath and doth occasion building and employing three times the number of ships and seamen that otherwise we should or would do." Decker in 1766 referred to it as "that most glorious bulwark of our trade." ('High Duties,' p. 21). Lord Sheffield called it in 1783 "the guardian of the prosperity of Britain," and even Adam Smith says "National animosity at that particular time aimed at the very same object which the most deliberate wisdom would have recommended."

Thus contemporaries seem to have believed that the policy of the Navigation Acts was effecting its object and that it did actually build up the maritime power of Great Britain. To that policy Parliament held steadily till the end of the 18th century.

The result of the acts on the colonial system is also a matter of dispute. They have been unjustly blamed as being the cause of much friction between the colonies and the mother country. Indeed they have been alleged to be one of the primary causes of the loss of the American colonies. It must, however, be remembered that the acts were by no means strictly adhered to in the 17th century either in England or the colonies. Especially was this true in the case of New England where smuggling seems to have attained the dignity of a profession. In 1696 it accordingly became necessary to reorganize the Board of Trade, and Courts of Admiralty were established in the colonies to see to the more stringent enforcement of the law. A period of lax administration, however, began again with Walpole and lasted till the time of the Seven Years' War, when an attempt was once more made to stop evasions. After 1763 the acts were to be worked so as to afford a revenue by which the colonies should contribute part of the cost of their own defence. Before that year the acts do not seem to have inflicted any great hardship on the colonists, and the commercial monopoly the statutes sought to enforce was scarcely resented. "Whenever the act pressed hard many individuals indeed evaded it," was

Burke's dictum, and this was certainly true as regards the trade between New England and the French West Indies and Newfoundland. The colonists obtained from those places the French manufactures which according to law they were bound to get from England, but no serious attempt seems to have been made previous to 1763 to stop this illegal trade.

Again, the bringing of the "enumerated" commodities to England involved no very great hardship. England was the natural market for those goods, she being best able to undertake the distributing business in Europe with her old established connections. Where the "enumerations" worked hardly they could be relaxed, as was done in the case of rice in 1730. Moreover, in return for the restrictions thus imposed bounties were given to the colonists on the production of naval stores and copper. The growth of tobacco was put down in England so as to give the colonists a monopoly of the market. Another compensation was afforded to the colonies in the great development of shipbuilding and the carrying trade due to the protection given by the acts to colonial shipping. Massachusetts not merely sold ships in Europe, but in England itself. The causes of the loss of the larger part of the first English Empire do not lie in the trade policy of the Navigation Acts.

In the 18th century the Dutch were outdistanced and England at last attained the position at which she had aimed of being the great carrier of the world. There is, however, no evidence to prove that the Dutch were injured vitally by the English Navigation Acts. The English colonial trade even at the end of the 17th century was only a small trade in the aggregate, and could not have been any very great loss to Holland at the time. The ultimate loss to the Dutch was no doubt great, since they were shut out of a branch of commerce which was capable of great development. The Dutch decline did not begin till 75 years after the passing of the act of 1651. It was the increase in the volume of English trade while the Dutch trade remained stationary that raised England to the predominant mercantile position.

Between 1796 and 1822 many minor relations of the Navigation Acts were placed upon the statute book. Between 1822 and 1826 England's policy was materially changed. Reciprocity in matters of navigation took the place of monopoly. This involved also an alteration in the relations between the colonies and the mother country. To retain for the mother country the bulk of the colonial trade a system of preferential duties was established within the empire. Between 1849 and 1854 the restrictions on foreign shipping and the colonial trade which were embodied in the Navigation Acts were wholly swept away owing mainly to the adoption of free trade.

**25. BRITISH SHIPPING.** To an island people, and especially to a nation which has necessarily to import four-fifths of the wheat it consumes, and fully one-half of the total amount of its food from countries beyond the sea, a large and efficient mercantile marine is a vital need. To such a nation, from a national point of view, the shipping and shipbuilding trades must be the most important of all trades.

At the present time the shipping trade is not only the most necessary, but in point of magnitude, it is the greatest of British trades. It is impossible to state with precise accuracy its total volume in terms of money, but a careful and cautious calculation estimated the earnings of British ships in international trades, for the carriage of cargo alone, £450,000,000 per annum. If to this sum be added the earnings of the passenger and mail services, and of the coasting vessels at home and abroad owned and controlled by British subjects, the total, in the opinion of those best qualified to judge of the question, cannot be less than \$600,000,000—an amount greatly exceeding the entire product of the largest British manufacture, that of cotton, which is estimated at \$450,000,000, and is about equal to the total gross revenue of all the British railways. Deducting a small percentage for the port dues and charges of the ships in foreign ports, the whole of this sum is distributed among British industries. Unlike the cotton manufacturer who must pay away half his total receipts for his imported raw material, the British ship and her engines are built of British materials in British shipbuilding yards, the officers, engineers, and more than four-fifths of the sailors are British subjects; the vessel is repaired and provisioned in British ports, is coaled at home, and generally abroad with British coal, and insured by British underwriters. It will be seen that British shipping is emphatically a national industry. About one man in 36 of the population is directly employed in some capacity upon the sea, but those indirectly employed in the trades ancillary to, and created by, the shipping industry are many times greater.

The latest pre-war returns issued by the board of trade, those of 1914, give the total tonnage of the merchant vessels registered under the British flag as 14,168,274 tons net register, of which 12,415,204 tons belonged to the United Kingdom, and 1,753,070 to the self-governing colonies and other British possessions. Of the British tonnage, 12,403,231 tons consisted of steamships, and 1,765,043 tons of sailing vessels, that is to say 93 per cent of the tonnage of the shipping of the United Kingdom is that of

steamships. The number of vessels (1913-14) registered in British ports was 39,592. These figures are calculated in "net" tons; the "gross" tonnage of British shipping was over 20 millions before the war. It is impossible correctly to appreciate the value of these figures except by comparison with those relating to other nations. A mere statement of total tonnage, however, is an incomplete statement of relative commercial efficiency. The best authorities calculate three tons of sail as being equal to one ton of steam, the latter at the low speed of 10 knots per hour. Whereas 93 per cent of the tonnage of British shipping is that of steamers, about one-third of that of other countries consist of sailing vessels. Further, an analysis of the character and speed of the relative fleets gives still further proof of the superiority of the British marine. A high shipping authority, the editor of the *Shipping World* (of London), after long and careful research made and published as accurate and impartial an estimate as it is possible to make of the comparative efficiency of the British and foreign mercantile fleets. Taking a 10-knot steamer as a unit, and adding and deducting from tonnage in proportion to the departure from this standard of speed, to obtain the potential carrying power, he finds that the potential carrying power of British shipping in 1905 was represented by the figures 16,445,000 against 13,061,000 for that of all other countries combined; while, if steam tonnage alone is taken, the figures for potential efficiency for the United Kingdom, and all other countries taken together, were 15,834,000 and 11,555,000 respectively. In 1917, according to the same authority, about half the *ocean-going* ships of the entire world were sailing under the British flag.

The British demand for new ships is entirely supplied by the shipbuilding establishments of the country, which in addition have built for other nations during the five years 1910-14 inclusive, an annual average of about 1,027,755 tons, exclusive of ships of war. The mercantile fleets of other nations also consist, to a considerable extent, of the vessels discarded and sold by the British shipowners.

To this remarkable concentration of a great trade, one of a specially international character, and one greatly desired by all, in the hands of one nation, many causes have contributed. History shows that it cannot be attributed to commanding geographical advantage in the position of the British Islands, nor to any supreme aptitude of the British people for the life of the sea, and for conducting the oversea trade of the world. In the art and the science of shipbuilding the French have always been well to the front. In the Napoleonic wars Nelson's best ships were those he had captured of French build. In our own time the French have more than once given a lead in naval construction; the first armored ship was French; it was the French who introduced the water-tube boilers, and constructed the first submarines. The coasts of Normandy and Brittany have always furnished hardy and courageous sailors and fishermen, and yet to-day France stands low in the scale of mercantile maritime powers, notwithstanding the heavy subsidies she pays to her shipbuilders and shipowners. America contests with Great Britain the honor of successfully applying steam to navigation. Ful-

ton's experimental boat in 1798 was four years earlier than Symington's *Clermont* on the Forth and Clyde canal. The *Savannah* in 1819 was the first vessel with auxiliary steam to cross the Atlantic. Both in the construction of sailing ships and in the improvement of the early marine engine America led. The supremacy of the British mercantile marine, therefore, cannot be attributed to the possession of superior inventiveness or aptitude of the British men for the command of the sea. The phenomenon itself is a very modern phenomenon. "It may be assumed," says Mr. Cunningham, an authority on economic history, "that in the Middle Ages the shipping of the Italian Republics and the Hanse League excelled that of England." The chance of England did not come in fact until the discoveries of Columbus and Vasco da Gama opened the western and eastern oceans to commerce, which, until that time, had been confined principally to the Mediterranean and other inland seas. In later times we find that Spain and Portugal, and afterward Holland, took the lead in the new ocean traffic, so much so that in 1603 Sir Walter Raleigh wrote, "The merchant ships of England are not to be compared with those of the Dutch." The English position, however, was improving, and in 1666 Sir Henry Petty estimated that the Dutch shipping tonnage amounted to 900,000 tons, English to 500,000, French to 100,000, Hamburg, Dantzic, Denmark and Sweden to 250,000 and Spain, Portugal and Italy to 250,000. At this time English shipping was subject to the celebrated Navigation Act of Oliver Cromwell (1651), the principle of which, broadly speaking, was to confine foreign trade with European countries to the vessels of Great Britain or of the country with which the trade was carried on; and all trade with any of the more distant continents, or with any of the plantations of Great Britain, entirely to British ships. The Navigation Laws of other maritime nations were framed in a similar spirit on similar lines. In the international race all competitors were pretty equally privileged or handicapped. Although the whole system had become riddled with exceptions and exemptions and suspensions, due sometimes to necessity, and sometimes to reciprocal treaties, the principle of the legislation of Cromwell remained in force until the Navigation Acts were finally repealed in 1849. The great expansion of the trade of the world in the first half of the 19th century together with the improvement in the size, speed and cost of building and operating the new steam fleets, had rendered it generally impossible to maintain the mediæval system of the old Navigation Laws, and although other nations did not, like Great Britain, emancipate themselves from these fetters at a stroke, they have found it impossible to maintain them, and the relics of the ancient system survive in the present day chiefly in the form of the reservation of their coasting trades by many, though not all of the civilized nations of the world; certain restrictions on their colonial trades, and in addition to this, in the case of the United States, the restriction of the privilege of the American register, with its exclusive right to the coasting trade, to ships built in America of American materials. The mediæval system in its old barbarous form has universally passed away, and for more than half a century Great Britain has carried on her over-

sea trade in the atmosphere of free competition.

In all the previous centuries she possessed no marked superiority as a shipowning and seafaring community, and at the time of the Free Trade revolution (1846) she might only with some doubt be placed first among the mercantile maritime powers. She was then making no marked progress in comparison with other nations, and in some respects was declining. For example, although after the great war in 1815 the shipping tonnage of the United States was not half that of the United Kingdom, in 1850 the American mercantile marine had grown to be very nearly equal to that of England in total tonnage, if coast and lake and river steamers be included, and greatly exceeded it in efficiency, for it included more than half a million tons of steam shipping against less than 200,000 tons of British shipping of the same class. Although the tonnage of all American ships registered for oversea (foreign) trade was at that time only about one-third of that of Great Britain, it was superior in quality, and was increasing with greater rapidity. The Americans excelled in the speed, efficiency, and beauty of their sailing ships, and the celebrated "Baltimore Clippers" and "American Liners" almost monopolized the carrying trade between Great Britain and the United States. In the middle of the 19th century it may be said that Great Britain and the United States were worthy and well-matched rivals in the race for leadership upon the ocean.

It is an interesting question to ask what are the causes to which this modern phenomenon, the supremacy of Great Britain in the trades of building, manning, and operating ships, is to be attributed; and especially those which have led to the decline in the mercantile marine of the United States registered for foreign trade, almost to the point of extinction. It would be erroneous to attribute this commercial revolution to any one cause. The substitution of steam for sailing ships does not appear to have been of any particular advantage to Great Britain, for during the first 30 years of the existence of sea-going steamships America kept the lead in this class of shipping, and her engineers contributed largely to the earlier development of the marine engine. The later substitution of iron and steel for wood as the material for the construction of ships undoubtedly gave a great temporary advantage to England, which was at that time and remained for many years the largest and cheapest producing country of iron and steel, but it does not explain the fact that while the production of iron and steel in America now greatly exceeds that of the United Kingdom, this country has not been able to regain any considerable portion of the trade of building and operating ships for international commerce. Undoubtedly the American war had a disastrous temporary effect upon American shipping, shown by the decrease in the tonnage of ships registered for oversea trade from 2,546,237 tons in 1860 to 1,516,800 tons in 1870. The principal explanation of this phenomenon is undoubtedly to be found in the opposite fiscal policies pursued by the two countries. It would not be proper in this place to enter into an argument as to the general results of the British policy of free trade, and the American policy of protection upon the two countries, but it is a fact admitted alike by freetraders and

protectionists, that the control of this particular trade of international shipowning and shipbuilding has been determined by their mercantile policy. (See GREAT BRITAIN — FREE TRADE). The growth of the shipping supremacy of Great Britain, a supremacy becoming more marked each year, dates from the adoption of the policy of free imports in the years 1840-50, coupled with the abolition of the Navigation Laws in 1849. The process of the absorption of international shipping by British shipowners has undoubtedly been assisted by the protection policy of other nations. By restricting their importation of British material goods, the inexorable economic law which compels each trading nation to pay its debts and balance its international accounts, has rendered it more convenient for Great Britain to pay for her great imports of food and raw material to the nations which refused her cotton goods or her iron, in the form of shipping services, which form at the present time the largest of British exports. The result has been that while the total volume of British trade amounts to not more than one-seventh of the trade of the world, British ships carry about one-half of the trade of the world. The volume of purely foreign trade, that is of trade between foreign port and foreign port — trade which does not touch the ports of the United Kingdom, carried by British ships — largely exceeds that of the direct trade to and from British ports. In contrast, the gradual decline of the American trade is well set out in a statistical table prepared by Mr. Meikle, Secretary of the Seattle Chamber of Commerce, and published in the report of the Merchant Marine Commission at Washington in 1905. It showed that in the year 1821 the percentage of the import and export trade of the United States carried in American bottoms was 88.7. This proportion, which remained fairly steady until 1850, had shrunk in 1860 to 72.5 per cent. From that year onward the decline became increasingly rapid until in 1900 the percentage carried in American bottoms was only 9.2. In 1914 British shipping employed 295,652 men and boys. Of these 212,640 were British, 31,396 foreigners and 51,616 Lascars. Of the foreign tonnage (61,429,000 tons) entered and cleared at British ports in 1914, Germany had nearly 11,000,000; France, 4,759,000; Russia, 1,675,000; United States, 1,548,000 and Japan, 682,000.

The total loss of merchant shipping to the United Kingdom from the outbreak of war to 31 Aug. 1918 was 8,761,368 gross tons, of which 4,544,195 gross tons were replaced by new construction during the same period, making a net loss of 4,217,173 gross tons — about one-fifth of the British mercantile marine. Shipping captured from the enemy amounted to about 800,000 tons.

*A Lord Commissioner of the Treasury.*

**26. BRITISH RAILWAYS. Comparisons and Contrasts Between the Railway Systems of Great Britain and the United States.**—“The plastic American instinct has introduced the wholesale principle into regions where the slower-witted nations of Europe have never thought of applying it. The factory life of England is new and British manufacturers fully appreciate the economies to be effected by turning out pins by the million gross, cotton yarn by the million pounds, and steel rails by the tens of thousands of tons. But the Americans have applied the principle to businesses which have existed since the dawn of civilization. Their hotel-keeping is wholesale; their farming is wholesale; and, most of all, their transportation system is wholesale. The English farmer still looks upon the railway train as only a slightly magnified carrier's cart, and persists in sending his basket of eggs or his hamper of vegetables to market, as his grandfather did when George III was king. The American farmer does his business in carloads.”\*

The writer, in a book written by him 27 years ago, after his first visit to the United States, pointed out in these words what seemed to him then, as it seems to him now, the essential differentia between English and American railroading, and suggested that the difference is not accidental and specific, but part of the generic difference between the two countries which naturally arises from their different historical and geographical position.

But there are other important differences between the railways of England and the United States. England is an island, and a small one; America is a great continent. The maximum possible haul within the British Isles is just about as far as from New York to Chicago. In fact there is practically no traffic here requiring to be carried any such distance. If it did, it would probably go by water, for there is no place in Great Britain more than 80 miles from a sea port. Anything over 100 miles is referred to in England as a long haul; in the United States the average haul of freight is 156 miles, the average passenger journey in the United States is 33 miles; in Great Britain it is probably—accurate statistics do not exist—about 10 miles.

Again, Great Britain is densely populated; the United States is the reverse. On one twenty-fifth of the area of the United States, England has half as much population. Naturally, therefore, while the United States has fewer miles of railway per square mile of area, Great Britain has fewer miles per thousand of the population. Roughly, the United States has eight and one-half miles of railways per 100 square miles of area; Great Britain has over 19 miles. But in Great Britain there is a mile of line for every 2,000 of the population; in the United States a mile of line for every 400. The population of Great Britain and, therefore, its intercourse, per mile being so much greater, it is also natural that a mile of railway is a much more elaborate thing than in the United States. For every route mile in the United States there are one and one-half miles of track, while in Great Britain there are nearly two and one-half miles. In equipment the contrast is even greater. With only one-tenth of the mileage of

railways in the United States, Great Britain has nearly two-fifths the number of locomotives, half as many more passenger cars, and nearly as many more freight cars.\* Put another way, a mile of English railway represents an expenditure of almost as many pounds as a mile of American railway represents dollars; a mile of English line earns gross two dollars for every dollar that an American mile earns and earns net in the ratio of three to one. In Great Britain the railway occupies in great measure the place of the street car of the United States, and is the means by which large sections of the population move daily to and from their work. And whereas the typical freight consignment in the United States is a “straight” carload of produce carried for a long distance, the typical consignment in Great Britain is a single box, or bag, or bale, or other package of manufactured articles, carried from one town to another closely adjacent.

The service required of the railways by the public of the two countries being so entirely different, it is only natural that the method of performing it, and the charges made for it should show equally wide differences. In the United States the railways receive three cents per mile on the average for every passenger, and at this rate find passenger traffic barely profitable. In Great Britain the railways receive hardly, if at all, more than one cent a mile on the average. Yet they can make a handsome profit, despite the fact that they give a much more frequent and a faster service, with accommodation certainly not inferior in comfort. The mainstay of railway prosperity in the United States is in the carriage of freight at a rate of, roughly, four miles for three cents. English companies' receipts average, it is estimated, not less than two cents for each mile. Yet the prevailing opinion of those best qualified to judge is that much of the freight traffic in Great Britain is unprofitable, while not a little is done at an actual loss—for the irony of fate has decreed that England, with freight rates undoubtedly on the average the highest in the world, shall also have certain rates undoubtedly the lowest. For instance, for eight cents the Great Eastern Railway Company will bring from any of its country stations, say between 50 and 130 miles off, and deliver to the consumer's door in London a box of farm or garden produce of a gross weight of 20 lbs.

On the outbreak of the war the government took over the railways of the country. The latest available statistics (1915) show a total of 40,808 miles of running lines, made up of 23,709 miles single-track; 13,403 miles double-track; 1,648 miles three-track; 1,277 miles four-track and 706 miles more than four-track. The train miles run numbered 273,659,000 passenger, 156,007,000 freight and 666,000 mixed. Including switching (shunting) operations, a total of 621,239,000 engine miles were recorded for the year. Total number of passengers carried, 1,591,146,000; freight tonnage, 568,201,000.

**Similarity.**—England and the United States are the only great countries where the railway system has been provided by practically unaided

\*Of course in Great Britain the locomotives and cars are smaller and freight cars only one-third of the size of those of the United States. The comparison includes coal cars privately owned (believed to be not less than 700,000 in number which are ignored in English official statistics).

\*“The Railways and the Traders.” (London 1891).

private enterprise, and still remains wholly in the hands of practically independent private companies. In both countries the state has found it necessary to interfere at many points, and an interesting essay might be written comparing the methods of government control adopted in each. But here it can only be very briefly pointed out that in both countries the Anglo-Saxon tradition prevailed, and such governmental control as existed took in the main a legislative and judicial form. Executive interference—which in France descends to the minutest details of every-day operation—is in England still of relatively small importance. Till recently, however, it was safe to say that English railways were and always had been more closely supervised by public authority than the railways of the United States. That is no longer true. Such scant powers of interference as our executive authority, the Board of Trade, possesses to-day, it has substantially possessed from the outset. And there is not much serious public demand for further interference.

**Laws Governing the Railway Systems.**—According to the English code of railway law, which took practically its present shape as long ago in 1845, no company can come into existence, no new line can be constructed, no new capital can be raised without the authority of a special Act of Parliament, which lays down in great detail the constitution of the company, the exact route of the line and its method of construction, the amount of the capital and the purposes to which it shall be applied. Maximum rates and fares for goods and passengers are also prescribed. The authorized railway cannot be opened for passenger traffic until an inspection by public authority has secured that every possible precaution for safety has been taken. Once opened, however, the operation of the company is in the main in its own hands. There is, however, one very important point where the state interferes. Whenever an accident happens an expert official of the Board of Trade holds an exhaustive inquiry. He has no power except to inquire and to recommend. But his report is published, and in normal cases the companies are very ready to fall in with it. If they unreasonably fail or neglect to do so, public opinion soon converts the recommendation into a command. It is the simple truth to say that under this system the English railways have been on the whole over a long series of years the safest in the world. Better proof could hardly be sought of what Mr. Charles Francis Adams calls "The eventual supremacy of an enlightened public opinion." On the side of commercial management such control as exists is in the main judicial. A special court, the Railway Commission, exists to watch over the observance of the law of undue preference. Its powers are, it is true, seldom invoked, but that is the best proof of their real efficacy. Further, the same tribunal has power to forbid the increase of any existing rate for goods, and does in fact refuse to permit any such increase unless under exceptional circumstances. There is no popular prejudice in England against pooling. Our railways constantly enter into pools or, as we call them, traffic agreements. In some cases even one company is paid by another a sum of money annually on condition it does not compete for certain traffic. Sometimes these agreements are specially sanctioned

by Parliament, sometimes they are made by the companies under the general powers and sometimes they are submitted for approval to the Railway Commission. See RAILWAY CONSOLIDATION, ENGLAND.

**Finance.**—The capital of each company is regulated in detail by Parliament. It is an almost invariable rule that not more than one-fourth of the total shall be borrowed money, which you call loans and we call debentures. Railway debentures are consequently among the safest of investments and sell at a price only a very little below that of consols. Of the share capital usually from one-third to one-half is in the shape of non-cumulative preference shares bearing a fixed rate of interest. The remainder is ordinary stock. But ordinary stock in England, where traffic varies little from year to year, and where railways are complete and finished before they are first opened for traffic, pays an almost unchanging dividend from year to year, averaging about 4½ per cent. And preference shares accordingly are regarded as practically nearly as safe as debentures. Railway stocks of all kinds, debentures, preference or ordinary, were till about 17 years ago the most favorite investment for the savings of the bulk of the people. Since the beginning of this century there has been a marked change. This is partly due to an external cause—the increased value of money in the market—but much more is it due to internal causes. Constant pressure for lower rates and improved service by the public, constant demands for higher wages are made in England, as in all other countries. But there is more than this. For a long period, while American railways were ploughing their earnings wholesale into the road and Continental railways were forming sinking funds or paying off terminable annuities, English railways were thriftlessly financed. They divided up to the hilt, formed no reserves and charged every betterment to capital. Of recent years there has been a great change for the better. Property is being improved out of income, reserves are growing. But meanwhile the shareholders are paying, in reduced dividends and still more in reduced salable value, for the financial errors of the past. Stocks of some of our great companies, which 20 years ago stood at or near 200 can to-day be bought at about par. And yet meanwhile the dividends will have only fallen from 7 per cent to 6 per cent or from 6 per cent to 5½ per cent. The former price was undoubtedly too high. The present price is probably too low and at the time of writing recovery seems overdue.

The total paid-up capital of the companies at the end of 1914 was £1,334,011,000 (\$6,670,055,000), of which about 15 per cent represents nominal additions due to consolidation, conversion or division of stocks.

One other point of contact between England and the United States may be noted in conclusion. Between them they are responsible for the original invention of railways, and for every important improvement in railway methods and practice that has been introduced since. There are some students of railroad history who, spite of the fact that the nations of continental Europe are more and more going over to national ownership of railways, believe that this is no accident, but rather a natural result of the Anglo-Saxon habit of leaving to private enter-

prise the utmost freedom which practical experience shows to be compatible with the welfare of the nation at large.

**27. THE ENGLISH LAND LAW. Sources and General Characteristics.**—The law of land, or "real estate" bears the traces of the different streams of influence that have made English history. It derives its main characteristics from the feudal organization of society, but these characteristics have been superimposed on other systems, or combined with other elements, which may be of early Germanic, Celtic, or in some instances even of Roman origin. Again, the land laws have been the subject of frequent legislation; in the usual English method particular evils have from time to time been remedied without any logical recasting of the body of the law, and without the removal of mere anomalies which could not rank as grievances. But the main principle of the law may still be called feudal.

The modern law may be compared to a chalk cliff in which are many fossils; a cliff pierced by works and tunnels for such useful purposes as railways or mines, but left, where modern necessities have not interfered, to the slow decomposing action of the elements. The chalk is the feudalized common law, the fossils are pre-feudal survivals, such as land of "copyhold" tenure, the works and tunnels are Parliamentary statutes and the elements are the forces of public opinion acting by judicial exposition and construction. Compared to the law as it was in the early years of the 19th century, the modern law of real property is simple, but if it be tested by any more severe standard it still retains many intricacies for which it is easier to find a historical than a logical explanation.

Land on feudal principles is the subject of tenure and not ownership. No man owns English land unless he be King of England. Land is always "held of" some one—either the King, or a tenant in some degree of the King. Land was thus originally looked on rather as the means of fulfilling a duty than as so much property, and for the comparatively simple conception of ownership was substituted the more subtle idea of "estates," i.e., parts of and interests in ownership. Some of these interests were not recognized in the courts of common law but only in "equity," i.e., the extraordinary jurisdiction of the Chancellor. In time the feudal idea of tenure ceased to express the real state of things, and a tenant in fee simple became and has for many centuries been an absolute owner.

But the inherited complications remained and indeed grew, being constantly developed so as to evade and even counteract Parliamentary statutes which landowners and the legal profession viewed with disfavor. In 1832 the English land law was a vast metaphysical system requiring and developing great acuteness of intellect among practitioners but utterly unintelligible to a layman.

The feudal theory of tenure gave to English land holding a certain social character which in many country districts has never been lost. To this day land in rural England is looked on less as a means of livelihood or source of income than as giving a certain social status to which rights and obligations are attached. Indeed it would be difficult even now to give a better definition according to received ideas of the English upper social class than to say that it consists of the owners of the country estates of England.

The legal position of the possessor of land may be considered in three main aspects; his relations to his predecessors and successors, including what may be called family law; his economic and social relations, including the law of landlord and tenant; and his relations to the community as a whole including his liability to taxation and generally the rights and powers of the State.

**Family Law; (1) Settled Land.**—England is a country of large properties, and most large properties are, to use a legal phrase, "Settled Land." The meaning of this is that by the terms of some deed or will (called for this purpose "a settlement") the land is not at the disposition of a living person to sell, mortgage or give away; the apparent owner is only what is called a "tenant for life," and on his death the land will pass to some other person, generally his eldest son, if he has children, but if he has not, then to some collateral relative, without any effort and without any power of interference on his part. A "settlement" of this kind may be looked on as a temporary and conventional "entail"; it originates in the voluntary act of some tenant in fee simple and its duration is limited by law to the life or lives of some person or persons in being when the settlement is made and a further period of 21 years afterward. The practical effect of an ordinary English settlement is to preserve the land for two or even three generations to the eldest living male of the senior line as head of the family to the exclusion of females and younger sons. In most land-holding families as soon as the person who will succeed to the land not merely as a life tenant but with absolute power of disposition, is next in succession and is 21 years of age, he joins with the existing tenant for life—usually his own father—to resettle the land for another two generations. Thus one settlement succeeds another and a tenant in fee simple is rarely, if ever, in possession. Provision is usually made for a widow of a tenant for life by giving her an annuity known as a "jointure," and younger children are given comparatively small sums of capital known as "portions" which are made charges on the estate. The practice of settlement is permitted but not enjoined by the law; it came into fashion about the middle of the 17th century. It is thought by some observers that the practice now shows some signs of being on the wane, but no direct evidence is available;

certainly it still affects nearly all large properties, and therefore the greater part of English land. Its result has been to make each eldest son in turn the proprietor of one or more family estates, to prevent the dispersal of land into many hands and to keep for the head of a family a social prestige and pre-eminence among both relations and neighbors. If there happens to be a peerage or baronetcy in the family, the land practically always goes with the title. In fact it is not uncommon even in cases where there is no title or honor in the family for the settlement to provide that any person succeeding who does not already bear the family name—e.g., a married daughter, or a daughter's son—shall take the name and armorial bearings of the author of the settlement on pain of exclusion from the property. Younger sons, on the other hand, after a boyhood spent on the family property are left with slender portions to make their own careers; thus in their case class distinctions tend to be obliterated; younger sons of the land-holding class may be found in almost every branch of activity, in the navy, the army, in orders in the Anglican Church, in commerce and in the learned professions.

British colonial development owes much to the adventurous disposition fostered by the outdoor life and the economic necessities of the younger sons of the land-holding classes.

Formerly the main economic objection to the legal fetters imposed on land-holders by settlements, was that during a settlement the land was taken out of commerce as it had no proprietor who could sell. This difficulty has now been removed as the result of an important act of Parliament (The Settled Land Act 1882). Every English tenant for life may now be considered as a kind of plenipotentiary agent for the whole family, born and unborn. Subject to certain not onerous restrictions, he can sell or lease for long periods on the recognized terms as he pleases, indeed he can do almost anything which a prudent and honest owner would do, but always on the terms that the property or the proceeds of sale are kept to descend in due course of settlement. But the real fetters on an English tenant for life are not those which the law imposes, but the fetters of tradition and family sentiment which no legal power or ingenuity can remove.

(2) **Lands Not Settled.**—Apart from this liberty of terminable settlement the English law does not favor restrictions on the powers of a landholder. No entail can by English law be created which cannot be destroyed as soon as some persons unborn at the date of its creation attain 21 years of age. In the 15th century English lawyers, more daring than their Scottish brethren, with public feeling behind them, went so far as in substance to defeat the provisions of a Statute of Edward I (*De Donis Conditionalibus*, A.D. 1285), by which Parliament had sought to make entails perpetual. Where land is not settled, in the case of the death of a landholder without a will, the common law on feudal principles gives his land to his eldest son; pre-feudal customs are, however, not left entirely without witnesses; in parts of the county of Kent the older custom of equal division, known as gavel-kind, still prevails, and in a few ancient boroughs under the custom known as "Borough English" the young-

est son alone succeeds. But cases of intestacy are not common among the wealthy classes.

**Wills.**—A tenant in fee simple has, contrary to feudal principles, been gradually empowered by successive acts of Parliament, culminating in the year 1662, to dispose of his land by will after his death in the same absolute manner as during his life. He can disinherit totally or partially all or any of his children and can at his pleasure give the land to strangers or, since the year 1891, even to charity. But the charity as a rule is bound to sell the land and not retain it.

**Landlord and Tenant. (1) The Town.**—There is a sharp contrast between the land system in the towns and in the country. In and near towns the proportion of settled to unsettled land is probably smaller than in the country; but even in the case of settled land the tie between landlord and tenant is purely economic. A town landlord may often be of inferior social standing to his tenant; further, urban and suburban land is often owned by commercial companies formed for dealings in land. But both in town and country, England is a land of large properties and it is the exception to find that the actual occupier of land is, in the popular phrase, "his own landlord."

On all land in or near towns, building is usually done on the leasehold system. By this system the land is let, usually to a builder, for a long period, from 80 to 99 years. The lessee contracts to build and keep his building in repair; to pay an annual "ground rent"; to discharge all taxes levied on the land, and in fact to bear all possible burdens connected with it. At the end of the lease the land and the building on it revert to the successors of the original landlord. The long lease thus granted may usually be sold or mortgaged at the pleasure of the lessee, and the building itself is frequently sublet by the lessee as landlord to the actual occupant as tenant, who pays to the original lessee or his successor a full or "rack" rent for building and land together.

Until recent years the whole tendency of the law was to favor the landlord as against the tenant, and even now the law can hardly be said not to lean in the landlord's favor, particularly in allowing him the right of distress for rent. In the exercise of this right, contrary to the general principles of English law, a landlord whose rent is in arrear can without the judgment of any court seize and sell any chattels of any person, whether his tenant or a stranger, that he can find on the premises, and thus pay himself his rent. Recent legislation (The Conveyancing and Law of Property Act 1881) has, however, interfered against the landlord, who, whatever the terms of the lease, can now no longer forfeit a lease for a casual breach of covenant not deliberately persisted in by the tenant.

This leasehold system in and near towns, though frequent, is not by any means universal, especially in the north of England; there, a common plan is to sell land for building purposes out and out, in consideration of a perpetual rent reserved to the vendor. Further, the simple plan of the sale of building plots for a lump sum is probably growing in favor, particularly in suburban districts developed by land companies. A company of this kind has no family pride in the preservation of its estate.

nor does it wish to realize an improved value after three generations.

(2) **Country.**—In the country districts the long leasehold system is unknown. The ordinary English farmer usually does not hold a lease for any fixed term of years, but has merely a tenancy from year to year determinable by 12 months' notice. As a rule all the farm buildings have been supplied by the landlord. The tendency of modern legislation is to give the agricultural tenant security for the value of his improvements, but the old law, which treats whatever is built or planted on land as an accretion to the land, and therefore the property of the landlord, still governs to a large extent the relationship of landlord and tenant.

The tie of landlord and tenant in the country districts is, for good and for evil, not merely economic. The landlords are the social magnates of the countryside. As unpaid magistrates they have had up till within recent years practically a monopoly of the ordinary dispensation of all minor criminal and some civil justice. On the other hand, in bad years they are expected by the common opinion of the countryside to allow and do allow considerable reductions on the agreed rent. A "good landlord" is the man who is always ready to aid his tenants in sundry ways. On well-managed estates, the system works easily. The system, however, is one which for its success depends on the peculiar social conditions which have hitherto prevailed in rural England, and its transplantation to Ireland, where these conditions did not exist, had results disastrous for both countries.

**Sporting Rights.**—In England the love of sport has been a prominent characteristic of the landholding class throughout all history; it is practically the universal custom for a landlord to reserve the sporting rights over agricultural land. If he does not exercise them himself, he lets them to some other person. Where sporting rights are reserved the tenant has no right to kill pheasants or partridges, but the Ground Game Act of 1880 empowers the tenant himself, and one other person authorized by him in writing, to shoot hares and rabbits on his land whether sporting rights are reserved or not, and whatever the terms of the tenancy agreement.

**Land and the State; Taxation.**—The taxation of land is a question that is complicated by some historical anomalies. (1) **Land Tax.**—The burden commonly known as Land Tax represents historically the surviving portion of a general tax in the nature of an income tax imposed both on real and personal estate in the year 1692; but it has for many years been a mere stereotyped incumbrance redeemable by the landholder, and charged on the value of the land as in the year 1692. On most urban land the tax has been redeemed. The Finance Act of 1909-10 (introduced in 1909) effected a revolution in land taxation and provided for (1) Duty of 20 per cent on unearned increment accruing from land; (2) reversion duty of 10 per cent on value of benefit accruing to a lessor on determination of any lease of land; (3) an "undeveloped land" duty of a half-penny per £ on site value of land not built on or used for any industry other than agriculture (payable by owner); (4) mineral rights duty of

5 per cent on rental value of rights to work minerals and all mineral wayleaves. (2) **Income Tax.**—Incomes derived from land, i.e., the net rent of land, are liable to income tax equally with incomes derived from other sources. (3) **Death Duties.**—Before 1894 land escaped the greater part of the death duties imposed on personal property, but since the Finance Act of that year all species of property are in this respect on an equality. (4) **Local Taxation.**—On the other hand a man's liability to local, as distinct from imperial, taxation is estimated by the value of the real property (i.e., land and buildings) which he occupies, no account (in spite of some earlier statutory provisions to the contrary) being taken of his personal property. On agricultural land, by an act of Parliament passed in 1896, only half the ordinary rate is paid. But no contribution is made to local taxation in respect of the capital value of land, or of land which is not occupied, however high may be its value. As a war measure the Budget for 1918-19 introduced a considerable increase in both direct and indirect taxation.

**Other Rights of the State.**—The feudal principle of the ultimate ownership of the King has produced little or no effect in giving to the state which the King personifies, rights over English land. The modern state has practically no mineral rights. The precious metals, gold and silver, which for commercial purposes are practically not found in Great Britain, are in law crown property and can only be worked under license from the crown. But all other minerals belong to the tenant in fee simple of the soil who leases or works them for his own private benefit. The crown lands in England are small in extent; ownership by local authorities is still in its infancy. There is no prairie land to grant to railway pioneers or new settlers. When land is wanted for the purpose of some undertaking of a public nature—such as a railway, waterworks or the site of a post office—it has, as a rule, to be purchased by the company, or authority concerned, under statutory machinery, by which the fair value of the land has to be paid, plus 10 per cent compensation for compulsory sale. In the year 1887 the principle of compulsory acquisition was, subject to many safeguards, extended to the acquisition by a local authority of land to be let in very small quantities, called allotments, to agricultural laborers or others for cultivation. The Irish Land Purchase Act of 1903 proceeded on the principle of a loan by the state to a tenant who wished to purchase his holding from his landlord, and agreed with him as to the price. It did not directly involve either public ownership or compulsory acquisition.

**Transfer.**—In recent years several attempts, culminating in the Land Transfer Act 1897, have been made to induce English landholders to abandon the present system of private transfer of land for a system based on a Land Registry. Under the present system whenever land is sold or mortgaged, it is necessary for the purchaser or mortgagee to satisfy himself as to the title by going into all dealings with the land for a period which may be as long as 40 years. This is an expensive process, but it has been endeavored by centuries of experience to English landholders and lawyers. At the

present time, a public Land Registry has been substituted for the old system only in London. The principle of the new system is to enter the name of the proprietor of (or rather the person entitled to sell) every piece of land on a register and to make land transferable by the person registered by means of a fresh entry on the registry, as if it were so much stock in the funds. The extension of this system to the rest of the country is a question of time; but in legal matters time moves slowly.

**Trend of the Law.**—Recent developments of the law have in nearly all cases tended to restrict the freedom of the individuals in relation to land. Neither in town nor country are landlord and tenant allowed to make what bargain they choose; it is assumed that the economic inferiority of the tenant places him at too great a disadvantage for it to be possible for him to make a contract fair to himself, and so beneficial to the community. Men are no longer allowed to settle their land in such a way as to make it unsalable, and the community has asserted the right to dispossess the individual, not only for definite works of a public nature, but in order to provide its poorer members with an interest in the land. It has also compelled land owners in the Metropolis to abandon the old system of private conveyance and mortgage for a system which is in a sense public, as it is worked by public officials, and which may thus be regarded as a kind of reversion to the old method of public transfer. The same system will also in time form a new and more accurate 'Domesday Book'—a purpose which the provision for a complete valuation of all the land in the kingdom as at 30 April 1909, under the Finance Act of 1909-10, was designed to effect. Finally, modern legislation has put an end to the former advantage of land in respect of taxation and so claimed a larger share in real property directly for the state. The simplification of the land laws may be said to be one aspect of this change; intricacy and subtlety of phrase and interpretation may be tolerated by a private owner as the price of the liberty of complicated dispositions and of secrecy, but these niceties are inconsistent with the uniformity which must accompany public control.

**28. AGRICULTURE.—THE 18TH CENTURY.** Between 1700 and 1815 English agriculture changed its whole character. England became a great wheat exporting country and continued so up to 1773. Great agricultural improvements were carried through, stock breeding became scientific, waste land was broken up, large portions of the fens were drained, big farms with enterprising up-to-date farmers became the object of every landlord and the agricultural system which had come down from Anglo-Saxon days, and which still prevailed over large parts of England, was given up. English farming became intensive in character instead of mainly extensive. The social effects of the change involved the disappearance or degradation of the landowning peasantry or yeoman class. On the other hand it was only by means of the great increase in agricultural produce that England was not starved into submission during the Napoleonic wars. The changes in agriculture of that century meant ultimately nothing more nor less than national independence.

One of the main objects of English policy had been for centuries the encouragement of agriculture. A sufficient food supply raised at home deprived the enemy of the power of cutting off supplies from abroad. Moreover agriculture was considered the best breeding

ground of good soldiers. Wheat also was an excellent commodity for ships to carry, and the encouragement of corn export formed part of the Navigation policy of the realm. The great attention bestowed by successive governments upon agriculture was the most original part of English policy. Her seamanship she copied from Holland, her industrial protection from France; but while every other country aimed at preventing the export of corn so as to have a sufficient food supply, England deliberately stimulated export believing that thereby farming would be best encouraged.

This policy reached its most complete expression in the Corn Bounty Act (1 Wm. and Mary, c.12) of 1689, by which, when the price of wheat was at or below 48 shillings (and proportionately for other grains) a bounty was given on export.

The result of this law was to attract capital into farming. Men who sunk money in improvements were assured of a price which should not fall below 48 shillings and under the stimulus of this certainty a great agricultural revolution began. There grew up gradually a class of capitalist farmers and "spirited landlords" who were willing to carry out experiments. The result was that by 1770 England not only produced food for a population that had doubled itself, but was the granary of Europe.

One of the great improvements of the 18th century was, for example, the manuring of land, by which Arthur Young calculated that three or four hundred thousand acres of waste were turned into gardens. A revolution in fodder was brought about by the introduction of turnips and clover, while careful attention to grass seeds resulted in good hay on which cattle could be kept in condition in winter. Previous to the introduction of winter roots the majority of the beasts had to be killed in the autumn and salted down, while the remainder declined in weight through sheer starvation. This annual loss was now averted and a supply of fresh meat secured all the year around.

It therefore became worth while to improve the breed of the animals themselves. Bakewell of Dishley and Coke of Holkham wrought a revolution in English life with their Leicester and Southdown sheep and Devon cattle. Animals were now raised primarily for food instead of for their wool or hides, they were ready for the market sooner and the average size of cattle increased considerably. Thus a larger food supply was secured, and the great stock-breeders wrought a change the effects of which were as far reaching as those of Watt and Arkwright.

Before however this scientific farming could become general it had to become known. Roads were undeveloped, people in one county could not know what was passing in another, there was no agricultural newspaper — no machinery to make this knowledge common property. Moreover with the inherent conservatism of the agricultural class it needs something more than mere knowledge to make a farmer change his ways.

The necessary diffusion of information was carried out largely by Arthur Young and the Board of Agriculture, while the stimulus of the great wars and the shortage in the food supply provided a powerful incentive for improvement

by means of high prices. Moreover, the growth of the iron and coal trade had led to the cutting of canals, and internal communications of all kinds were improved. People could get about; great towns began to grow up, providing an ever increasing market for food stuffs. It therefore became more and more worth while to effect improvements, and scientific agriculture became a patriotic hobby. The King himself wrote articles for agricultural newspapers and the great agricultural meetings and cattle shows put a spirit of emulation into farmers.

The chief obstacle to betterment lay however in the fact that much of the land was owned by small farmers who simply had not the capital to get good stock, implements, seeds and manures. Moreover, the system of farming among the peasantry was that of farming in strips, each man having about thirty strips of land but no two lying together. These strips were separated from one another by turf balks, and after the hay and corn harvest had been gathered all the animals were turned indiscriminately over the open fields. The system was most wasteful. It was quite impossible to adopt improved methods of cultivation on half acre strips. No winter crops could be grown because the cattle ranged all over the fields from September to February. No improvements in breed could be carried out when good cattle were exposed to the infection of the mangy village herds with their foot and mouth disease. No drainage could be attempted since the outfall would be on some neighbor's strip. The loss of time involved in going from piece to piece, and in carting little bits of hay and corn from different places, to say nothing of the waste of numerous footpaths and the endless disputes over real or fancied encroachments, made the system one which in the interest of good farming it was highly desirable to displace. It was established by the Board of Agriculture that tenants lived comfortably on enclosed land rented at 10s. 6d. (\$2.62) an acre who had starved on open farms at 2s. 6d. (62 cents) an acre and that enclosed land at 20s. (\$5) an acre was cheaper than open land at 8s. (\$2).

The famine years of 1795, 1800 and 1801 made the prosperity of agriculture a pressing national question. Enclosures were pushed on rapidly, partly by the agreement of the parties concerned, but mainly by private Acts of Parliament. The general result was that the scattered strips were given up and each farmer received an equivalent in a compact little holding all in one place.

Between 1770 and 1799, 1,375 enclosure bills were passed, between 1800 and 1819, 1,700. Altogether it has been calculated that over 2,500,000 acres were affected by the acts prior to 1801.

The result meant better farming, but it also involved great loss to the peasant and the laborer. The fees of the commissioners for redistributing the lands, the legal expenses of getting a private act, the cost of hedging the new farm, all bore hardly on the yeoman. Even when he had survived the actual enclosure he found it hopeless to compete with the capitalist farmer. The stuff he could raise would not bring a remunerative price in competition with that of the large producers. He was moreover hard hit by the loss of the bye employments of spinning and weaving which were tending to

become more and more factory industries. Many of the yeomen sold their little farms to large landowners who were only too anxious to throw them together into big ones in order to realize the high prices during the war period. Moreover the new men who were making their money in cotton were glad to buy land for the sake of social position. With an increasing struggle for existence on the one hand and the prospect of a good sale on the other the small farmers sold their holdings and disappeared. Those that held on were so hard hit by the great depression in agriculture after 1815 that they too were forced to succumb. Hence England between 1770-1815 became predominantly the land of the capitalist farmer.

The laborers, too, suffered considerably, since when the land was enclosed they lost many little perquisites such as turning out a cow on the waste or gathering fuel. But more important than all was the fact that the laborer lost the chance of rising in the world. The small farmer had ceased practically to exist and the laborers never could hope to get together capital enough to take a big farm.

But without the improvements of those years England could not have held out against Napoleon. She would simply have surrendered from famine when the Baltic corn was cut off.

The stimulus of the Corn Bounty Act started the agricultural revolution; the great was completed it. The result was an enormous advance in farming but great social distress; the extinction of the peasant proprietor, but the ultimate safety of England.

LILIAN KNOWLES,

*Reader in Economic History, University of London.*

**29. AGRICULTURE SINCE THE 18TH CENTURY.** History.—The close of the 18th century saw the English system of farming fully established, with its characteristic division of the landed interest into the three classes of landlord capitalists, tenant farmers, and laborers. Agricultural improvement had indeed made great strides during the 18th century, and in some parts of the country, as in Norfolk and Hertis, the change from the old open field system to large enclosed farms had already been accomplished, but it was the high prices for food, prevailing at a time when the rapid growth of a manufacturing population coincided with the Napoleonic wars, which finally swept away the village-community style of farming and replaced it by the large

tenant holdings as known to-day. The old system, while it supported a good many poor men on the land, was a very inefficient method of feeding the nation. The first condition of agricultural improvement was the investment of capital in the land, and the most economical way of doing it has proved to be to allow the landlord to use his money on the permanent amelioration of his property, leaving the whole of the tenant's resources free to be employed in his business of farming. The advantage of this system lies in the fact that the tenant's capital is kept in a liquid condition; he becomes a manufacturer of meal and corn, who hires land and buildings as tools in his business. The development of improved breeds of live stock and superior strains of crops has been made possible by the existence of a race of tenant farmers with both the means and the temperament to speculate in the development of their industry. The system has of course its drawbacks; it demands that the landlord should possess capital and some understanding of the agricultural situation; it lacks flexibility when a great economic change takes place like the fall in prices after 1876; it encourages too conservative a style of farming, for it checks the initiative of tenants by giving small security that they will reap the benefit of any increase in the value of the farm due to their improvements. Its intense individuality, from which so much has been gained in the past, becomes a drawback now that the farmers of a country are no longer competing with one another, but have to be organized to maintain their position in the common market of the world.

The agricultural history of the 19th century in Great Britain may be divided into four epochs, beginning with the period of inflated war prices which lasted up to 1816, during which time the great work of enclosing the common lands and forming large farms was practically completed. This was also a period of great activity in the improvement of farming; the foundations of most of the British breeds of live stock were then laid; machinery began to be applied to agriculture, and the reclamation of the wastes, practically the creation of good arable soil out of barren sands and intractable clays, proceeded with vigor. The value of marl on the light sands, and of chalk and lime upon the clays had long been known, but at this time such ameliorations were being carried out wholesale and with a thoroughness of which the British farmer is still reaping the benefit. There followed a period of 20 years of unexampled depression when the great break in prices, consequent on the end of the war, was aggravated by a succession of bad seasons. Little by little this depression was removed as the obligations incurred during the time of inflation became void, as the weaker farmers and small holders became squeezed out, and particularly as the consuming population in the manufacturing towns grew in number and wealth. The 40 years from 1836 to 1876 may be described as the Golden Age of British farming. The making of the soil by marling, claying, chalking, etc., went on apace; something like 3,000,000 acres were tile-drained in England alone between 1830 and 1870; simultaneously also science and the industries put at the service of the farmer nearly all the modern range of fertilizers and feeding stuffs—guano, nitrate of soda, phosphates and the oil

cakes. The modern breeds of live stock became clearly defined, and had their herd and flock books established during this period, and amongst the best practitioners farming became a fine art attaining the polish characteristic of a well-kept garden. Rents rose steadily with the competition for farms among not only the farming classes but also the tradespeople of the country towns, who saw in agriculture the road to wealth and an easy life; indeed, on the great estates where the tradition was against rack-renting the sound farmers were realizing very considerable fortunes.

The crowning period of this prosperity was the time of the Franco-German War of 1870-71. By 1875 the depression was beginning to make itself felt. Freight was low and foreign imports, especially American, of grain, wool, cheese and butter were beginning to grow rapidly. A run of bad harvests had also set in, culminating in the black year of 1879, when the lowest cereal yields on record, due to continuous wet weather, coincided with an enormous crop and corresponding importations from the United States. From this time the yield of corn in England ceased to rule its price, which has in the main been set in Chicago. The great change that then came over agriculture would have been less fatal had its permanent character been recognized earlier; as it was, on very many estates rents were not lowered rapidly enough, with the result that the old tenants were ruined and new ones could only be attracted by comparatively enormous reductions. Up till 1894 the gloom was unrelieved, the prices of corn and wool dropped year by year, although wages were rising, nor were there any new factors in sight which promised a change for the better.

It was the arable land farmers who suffered the most, particularly the cultivators of heavy land in the eastern counties and the midlands, where the land was expensive to work and only profitable when wheat and beans made a good price. This land gradually got laid down to grass; much of it went wholly out of cultivation for a time and was only reclaimed again as grass land by a new race of farmers who got it almost rent free. The western side of the country, which had always been in the main devoted to grazing and dairying and where rents had never been excessive, suffered comparatively little, nor did the highly farmed Lothians show the same fall in rents as the arable lands farther south.

Since 1894 the drop in prices has been arrested, and an upward turn has manifested itself for nearly all the products of the farmer, meat only excepted. At the same time, a new race of farmers had grown up, who discovered methods and openings by which a living may still be made out of the land. But though the agricultural situation may now be said to be comparatively stable and even improving, it is still full of difficulties. The British farmer is now competing with every country that has any agricultural produce to sell; the British market is the one open market of the world, and the price of any commodity is fixed by whichever country has a great surplus crop in that year. The proximity of the town, while it creates a market for certain products, also increases the farmer's expenses; in the end the manufactur-

ing industries set the standard of wages and draw off the energetic and the able among the laborers. At the same time the farmer has to conform to the urban standard of life; he has to pay for roads, sanitation and education of a style unknown to his competitors in a primitive country. Again, as a capitalist, he expects a return for the money he has invested in his business, whereas his competitors are, in most cases, content if they extract a living out of their labor, without taking into account the capital they have accumulated on their small holdings. Even the proximity to the great population, which ought to be the saving factor, is nullified by high internal railway rates, which compare unfavorably with the assisted freights of most competing countries.

During the period we have under review the British tenant farmer may be credited with two characteristic steps forward; the perfecting of a system of high farming and the fixing and improvement of a number of races of live stock. As regards the first matter—high farming—three contributing factors may be noticed. Owing to the changeable climate and the diversity of the soils the preparation of the land for crops has always required some nicety in management, and the British farmer in virtue of his long experience became something of an artist in the treatment of his soil. And though since prices have fallen some of his practices are no longer very remunerative, however desirable from the point of view of securing the "best" even if not the most paying crop, yet British farmers are still in the main more skilful than those in any other country, as far as the actual cultivation of the soil goes. Secondly, the British farmer early learnt the value of a good rotation of crops, which should not only provide something to sell, but which would also furnish a continual supply of food for his stock. The British farmer was the first to appreciate the possibilities which artificial manures put at his disposal; and the early exportations of guano, nitrate of soda, bones, etc., were in the main to the United Kingdom: Liebig even denounced England in no measured terms for her greed and wastefulness in drawing bones from all other civilized countries, and then squandering the phosphoric acid thus obtained by letting her sewage run into the sea. With the more intensive farming, due to better cultivation and the addition of manures, came improvements in the varieties of seed sown, mode of progress taken up with great energy both by individuals and certain firms of seedsmen. Though the results are not so noteworthy as in the case of live stock, yet most of the heavier yielding varieties, both of corn and of green crops, are of British origin, e.g., the "Squarehead" wheats, the "Chevalier" type of barley, the "drumhead" cabbage, all of which are widely spread over the world.

The final report on the Census of Production (1913) estimated the agricultural output of Great Britain at the value of £158,800,000, employing about 1,840,000 persons. The agricultural output of Ireland was valued at £45,574,000, and number of persons employed, about 984,000.

**Live Stock.**—But the special excellence of the British farmer has been his success in improving and fixing certain breeds of live

stock, which have now become the standard breeds all the world over. Up to the middle of the 18th century there were a number of types of cattle and sheep to be found in the different districts of the British Isles, as in any other old farming country; but these types were ill-defined and there was no common or conscious action toward fixing them in any desirable direction. Robert Bakewell, of Dishley (1725-1795), working on Leicester sheep and Longhorn cattle, first showed how a breed could be improved and fixed. Bakewell aimed at an animal which would mature earlier and would put on its increase in the most profitable places. Carrying a type in his mind, he selected a number of animals approximating to his ideal and bred only from them; then by a period of close inbreeding among such of the progeny as conformed to the type, he was able both to advance rapidly in the desired direction and also to eliminate a good deal of the tendency to fall back toward the old unimproved class of animal. At the same time it was found that this close inbreeding resulted in sires which had great power of stamping their character on their offspring, even when the dam is of a different or common strain. Thus Bakewell's Leicester sheep have been employed to give quality to almost all the other local races, and there are nowadays few breeds of sheep in existence who do not possess a strain of Leicester blood in them. Bakewell's Longhorns have not had a like success, but the same principles were applied to the native cattle of Teesdale, the Durhams or "Shorthorns" by the brothers Colling, who died in 1820 and 1836, respectively. Their work, continued by the Booths and by Bates, resulted in the modern Shorthorns, the typical beef-producing cattle of the world, with which, in the main, all the newer countries have been stocked.

The same progress was applied to other local breeds of cattle; the Herefords and the Devons in England, and the Aberdeen Angus in Scotland, have in the same way attained to far more than a local reputation, as also have several of the breeds of sheep, like the Southdowns or the Lincolns. Notwithstanding the existence in all old-settled countries of indigenous races, stock of British breeds are to be found all over the continent of Europe, either kept pure or more generally used for grading up the local type; while in the newer countries, which have become the great food producers of the world, none but breeds of British origin are to be found, with the exception of the Frisian or Holstein cattle, the Merino sheep and the Percheron horse. Also, the United Kingdom remains the great fountain from which these countries find it necessary to replenish their breeding stock, so that the production of pedigree animals of high quality continues to be one of the most lucrative items in British farming. In 1916 there were in the United Kingdom 2,100,000 horses, 12,412,596 cattle, 28,770,692 sheep, and 3,604,620 pigs.

**Agricultural Districts.**—Farming has now become a highly specialized business, showing great adaptation to the diversities of soil, climate and markets in the British Islands. Beginning with the southeastern counties; Kent, Sussex, Surrey, and Hampshire form a fairly defined area, possessing in general a warm and

dry climate. Here, but particularly in Kent, may be found the greatest development of market-gardening, fruit growing, hop cultivation, and other similar highly intensive forms of farming. As far as regards the production of very early crops this district cannot compete with the Channel Islands or Cornwall, but as main crops the standard green vegetables are grown in great breadths. This district is also noted for its hardy fruit growing; near Southampton on one hand and later in North Kent the greater part of the strawberries for London are produced. The best cherries have long been a special feature of East Kent, which country is also the largest producer of plums, apples, currants, and nuts. East Kent shows without doubt the best kept orchards in the country. Hop cultivation is also another leading feature of this district; no other farming industry is carried on so intensively or spends more on labor during the growth of the crop. The best of the hops march with the fruit in East and Mid Kent, but Sussex is also a large grower, as also is a belt of rich land stretching from Farnham in Surrey as far as Petersfield in Hampshire. The district under review has not perhaps the same reputation for general farming as it has for fruit and hops; it possesses, however, several distinct and valuable races of stock. The Southdown sheep are natives of the open chalk downs of Sussex; small, fine-wooled, and models of symmetry, they have been extensively used for improving the mutton of other breeds and form a great element in the foundation of such breeds as the Hampshire and Oxford Downs, the Shropshires and the Suffolks. Kent possesses in the "Romney Marsh" sheep one of the older breeds of the country; big, hardy, and long-wooled, which have lately proved valuable for crossbreeding in all parts of the world. The Hampshire Downs constitute a large framed, rapidly-growing breed that has been formed from a local coarse sheep by crossing with the Southdown. It exists in large numbers on the light arable lands of the great chalk area of which Hampshire forms the centre. Sussex also possesses a local breed of cattle; a horned, all-red, typically beef-producing breed, which has not spread greatly beyond its proper borders. Hampshire passes insensibly into the West Country—Wiltshire, Dorset, Somerset, Devon, and Cornwall—a typical stock district, showing less and less arable land toward the west. This is one of the chief dairying countries, milk being sent to London; while Somerset, in particular, is the original home of the "Cheddar" cheese, the typical cheese turned out nowadays on such a large scale in the United States and Canada. The cattle are mainly Shorthorns, though Devon possesses a dairy breed of its own, the South Hams, which have been raised from the true Devons by an infusion of Guernsey blood. The true Devons are an all-red, beef-producing breed, doubtless of common origin with the Sussex, but which has gone all over the world as among the thriftiest and most profitable of grazers. The Dorset horned sheep are characteristic of this area, a short-wooled, horned breed valuable for the production of early lambs. Somerset and Devon are also great apple-growing counties, though the fruit does not receive the care

which is to be found in Kent, and much of the product is only useful for cider-making. The southwest of Cornwall possesses an extremely mild climate, frosts being few and of no great severity; it has therefore become an important market-gardening district for the production of the earlier green vegetables and potatoes. The Channel Islands share the same advantages of climate, and, thanks to the skill and industry of their inhabitants, form perhaps the most prosperous agricultural community in the Kingdom. The land is divided into small holdings and is highly rented, but the farming is intensive and the crops valuable. In Jersey early potatoes, followed by green vegetables, form the staple crops; in Guernsey there has been a great development of farming under glass; cucumbers, tomatoes, grapes, early beans and flowers being the chief products. Each island possesses a special, though closely-related, breed of cattle, which by law has been kept pure and unmixed from any foreign blood for more than a century. These Channel Island breeds represent the descendants of an original Celtic race of cattle and are distinguished by the tendency to a yellow skin and black hair; they are small in frame, and produce large quantities of milk far richer in butter than that of any other breed. The Jerseys, in particular, have been largely exported to America as milk and butter producers.

The West Country shades off into the west Midlands — Gloucester, Hereford and Worcester, counties growing much hardy fruit and typical producers of cider. Here also is situated the other hop-growing area in the British Islands, the acreage under hops in the valley of the Teme and its tributaries tending to increase, while it diminishes in the southeast. This district is the original home of the Hereford cattle, red with white faces, which have become one of the great cosmopolitan races, famous all the world over as hardy stock fattening readily upon grass.

The Midlands proper are almost wholly laid down to grass; the broad belt of strong pastures stretching from Devon to Yorkshire, forms the great milk and meat-producing area of England. The cattle are mainly Shorthorns, as being valuable for both meat and milk, but many Herefords, Galloways and Welsh black cattle are also found fattening on the richer pastures. While these Midland pastures largely send new milk into the great towns, a good deal of cheese is made, the best known variety being the "Stilton," which is as typical of the English soft-curd cheeses as "Cheddar" is of the hard curd. Eastward the land comes more under the plow, Essex, Suffolk, Norfolk and Lincoln being typical arable counties. Lincoln possesses a large area of "warp" land composed entirely of alluvial sediments, and this, of great fertility for all purposes, is very largely given up to the growth of potatoes. On the strong soils of Essex and Suffolk the best English wheat is grown, wheat being still a profitable crop in this district; while Suffolk and Norfolk enjoy a great reputation for the growth of high-class malting barley. These counties are still, though not to the same extent as formerly, great centres of stall-feeding of cattle. Welsh "Runts," Shorthorns, and Aberdeen Angus stores are brought in and rapidly fattened on the turnips drawn from the arable

land. Norfolk possesses a native breed in the Red-Polled cattle, valuable for both their flesh and their milk-producing powers, and which are rapidly establishing a reputation outside of England. In Suffolk also is to be found a special breed of heavy horse, the Suffolk Punch, a compact, thickest animal of great value for farm work. All the low-lying country forms a fine breeding ground for horses, which is one of the staple industries of the eastern counties. The fen country indeed is the original home of the typical English "great" horse, the Shire horse, the most powerful animal of its kind in the world, particularly adapted to heavy work in cities. Bay, brown, and black are the commonest colors, and the feet and legs are thickly grown with white hair; the breed probably owes its origin to an influx of Flemish blood into the old English draught horse. Lincoln also possesses the chief of the English long-wooled races of sheep; heavy, rapid-growing animals, with a great fleece of long slightly lustrous wool. The Lincolns have been exported in large numbers to Australia, New Zealand and the Argentine for crossing with the Merino to yield a sheep equally valuable for both mutton and wool.

Turning to the west again, Wales is a country almost wholly in permanent grass; dairying and the raising of store cattle to be fattened in the midlands and east of England being the prevailing industries. The Welsh black cattle are good milkers, and, in addition, have long been esteemed under the name of "Welsh Runts," as hardy, thrifty grazing cattle, producing beef of high quality. Like all mountainous countries, Wales has a race of hill sheep, but on the lower lands, and especially in the border counties, the "Shropshire" breed will most commonly be seen. The Shropshire sheep is a short-wooled, small-framed animal, rather large and harder than a Southdown, but otherwise fulfilling the same purposes, producing mutton of the highest quality upon grass land and the lower hill pastures. On the Welsh borders also is to be found one of the native breeds of hill ponies, very slightly different from the two other breeds living upon Exmoor and in the New Forest, but quite distinct from the Shetland ponies, which are doubtless of Scandinavian origin.

Yorkshire provides perhaps the most varied farming in England; on the one hand there is the rich warpland adjoining the Humber, and the elevated arable sheep-farming land of the Wolds, then the highly-farmed general-purpose land of the central plain which merges into the upland sheep walks of the limestone country in the northeast. Horse breeding, stock raising and dairying are the mainstays of Yorkshire farming, and though no breeds of great note are associated with Yorkshire, except the white Yorkshire pigs and the Cleveland Bay Coach horse, it should not be forgotten that the original home of the Shorthorn was just as much the North Riding of Yorkshire as the Durham Tees-side, with which their names is always associated.

In the northern counties generally may be seen some of the best arable farming in England; a four-course rotation is generally followed, the foundation of the whole system being a good crop of Swede turnips, part of which are fed on the land to sheep, part carted

off for fattening stock in the yards. Barley is the money-making crop in the rotation, oats being the other cereal usually grown. The typical cattle of all this district are Shorthorns; in Cumberland, which is more of a grazing country, they are of the milking type, the beef strains predominating in the eastern side. The sheep are the Cheviot breed for the hill pastures, and the Border Leicester, which was originally produced by crossing the Cheviots with Bakewell's Leicester breed.

**Scotland and Ireland.**—Crossing the border in the Lothians of Scotland will be found the most highly-farmed general-purpose arable land in the British Isles. Here the management of the land, the utilization of labor-saving machinery, and the application of skill to intensive cultivation, reach a higher pitch than anywhere else in the world. The cropping is much the same as that of the other northern counties, but potatoes form the most remunerative crop; in the famous Dunbar district they are often sold standing in the field for \$150 (£30) per acre.

The southwest of Scotland is pre-eminently a grazing district; it is the home of two of the most distinct breeds of cattle, the Ayrshire, a typical dairy cow, yielding milk particularly suited for cheesemaking, and the Galloway, a polled black animal, characterized by its great hardiness and the fine quality of its beef. For generations the Galloways, either pure, or in the well-known "blue-gray" cross, have been exported to be fattened in the Midlands and east of England. The more northern counties of Scotland, naturally, in the main consist of grazing land. They have their typical race of Highland cattle and also carry the Scotch black-faced sheep, both slow-maturing hardy breeds, producing meat of high quality. The eastern counties, particularly Aberdeen, show some highly-farmed arable land, noted for the magnitude and high quality of its turnip crops, on which the cattle are stall-fed through the winter. For this purpose another race of cattle, now of cosmopolitan distribution, has been evolved, the polled black Aberdeen-Angus, massive animals noted for their rapid growth, symmetry, and quality of flesh.

Irish agriculture is of two classes; on the one hand there exists, especially in the west, a great number of small holdings, worked entirely by the single family, producing potatoes for home consumption and a little oats for sale, in addition to the milk or butter from a few cows on the rough grazing attached to the holding. The farming of these peasant proprietors is naturally of a primitive character, but the efforts of the Irish Co-operative Organization Society and later of the Irish Board of Agriculture have, during the last 20 years, done much to ameliorate the conditions under which they are working, particularly by the introduction of co-operative creameries. The Irish peasant farmer has quickly learnt to work on co-operative principles, so that the movement toward co-operation, headed by Sir Horace Plunkett, has enormously improved the character of Irish butter, a staple article in the English market, and must have nearly doubled the returns to the producer. On the other hand, Ireland possesses large farms of the richest grazing land on which are bred great numbers of store cattle of the Shorthorn breed for the

English market, as well as light horses of the best strain, wholly or nearly thoroughbred. The high quality of the pastures give these animals a foundation of bone and vigor of constitution which makes them respond freely to richer conditions in later life.

**Science and Education.**—Any survey of British farming for the last century would be incomplete if it did not take some account of the scientific and intellectual resources which have been at the service of the British farmer. Of these the Rothamsted Experiments form the main, practically the only British contribution to the world's stock of agricultural science. The foundation of these field experiments dates back to 1843, in which year J. B. Lawes, a Hertfordshire landowner, obtained the co-operation of J. H. Gilbert to carry out experiments upon field crops upon his own estate. This partnership in investigation lasted for nearly 60 years, the continuity of the work being secured by a Trust founded and endowed by Lawes. The main feature of the Rothamsted investigations has been field experiments with the various farm crops, conducted on a large scale and over a great period of time, and to them the farming community owes its knowledge of the principles of the nutrition of our domesticated plants. In 1906 the "James Mason" laboratory for agricultural bacteriology was added. Rothamsted was the forerunner of the many agricultural experimental stations which have been created in other countries; the first German Station at Möckern dates from 1852, the first American Station at Middletown, Conn., having been founded in 1875. It is noteworthy that though agricultural research has in every country become the business of the State, Rothamsted remains the only institution of its kind in the British Islands and receives an annual grant from the Development Fund of £2,850 (\$14,250).

From about the same period as the foundation of the Rothamsted Experiments, dates the establishment of the Royal Agricultural Society, which, by its institution of national agricultural shows held year by year in different parts of the country, has done much to foster the improvement of English live stock. For a long time also this society by its 'Journal,' by its appointment of consulting scientific advisers, by undertaking analyses for its members, was a great educational factor in the country, but the work of the society in this direction has of late years been largely taken over by other and more widespread agencies, while the society has no longer found fresh pioneer work to do but has more and more confined its energies to its annual show.

Agricultural education in Great Britain was for a long time restricted to private enterprise, the Royal Agricultural College at Cirencester being the first, and for a long time, the only institution giving a systematic training in agricultural science. There were in 1916 21 agricultural colleges in the United Kingdom, as well as professional chairs of agriculture in London, Reading, Bangor, Edinburgh, Cambridge and Leeds universities. According to official statistics for 1914, the acreage of arable land in the United Kingdom was:—England, 10,306,000 acres; Wales, 692,000; Scotland, 3,295,000; Ireland, 5,027,000; Isle of Man and Channel Islands, 93,000. The live-stock figures

for the same year showed 1,850,042 horses; 12,184,505 head of cattle; 28,000,000 sheep; and nearly 4,000,000 pigs. Total permanent pasturage, 27,351,000 acres; other grazing land, 13,000,000 acres.

Director of the Rothamsted Agricultural Station.

**30. BRITISH FISHERIES.** Sea Fisheries.—The great extent of seaboard in proportion to the land area of the United Kingdom

Kingdom. In Scotland only 10 per cent of the regular fishermen were engaged in trawling; in Ireland, 20 per cent, while in England and Wales trawling employed 8 per cent more hands than all other modes of fishing combined. This table does not include persons engaged in subsidiary occupations dependent upon the fisheries, such as boat-builders, coopers, box-makers, packers, curers, gutters, net-makers, etc. These were estimated in Scotland alone in 1913 to number 52,448. If the ratio may be assumed to be similar in England, Wales and Ireland, the total number of persons, who, before the war, depended for a living on the sea-fishing industry cannot be far short of a quarter of a million. The total weight and value of fish (not including salmon) and the value of shell-fish landed in the United Kingdom during 1913 are shown in Table II.

The craft of all kinds employed in the fishery were registered thus:

TABLE III.—NUMBER AND GROSS TONNAGE OF FISHING VESSELS AND BOATS REGISTERED IN ENGLISH AND SCOTTISH PORTS, AND THE NUMBER SO REGISTERED IN IRISH PORTS IN 1913.

combines with the wealth of the surrounding seas to render the fisheries a very important branch of British and Irish industry, as may be seen from Table I compiled from the returns for 1913—the last normal year before the outbreak of the European War, which, of course, has seriously interfered with the industry, withdrawing very large numbers of men from peaceful occupation and exposing those who continue fishing to risk of capture or destruction of boat and gear.

It may be seen from this table, which does not include salmon fisheries, how greatly the trawling industry preponderates in England and Wales as compared with other parts of the

plication of steam power to first and second class boats; and second, to the introduction of internal combustion engines to fishing craft of all sizes.

In Ireland there were 147 motor fishing boats owned in 1913, viz., 33 exceeding 25 tons burthen, 46 over 10 and not exceeding 25 tons, 30 over 5 and not exceeding 10 tons, and 38 not exceeding five tons.

The equipment of trawlers with wireless telegraphy dates from 1912, when a series of

experiments were undertaken by Messrs. Hell-yers of Hull and the Marconi Company. They were very successful, and previous to the outbreak of war a considerable number of vessels

had been fitted with the apparatus. One direct result of the substitution of steam for sailing has been to extend the range of British fishing vessels far beyond what was formerly possible. The North Sea continues to be a most productive fishing ground. It was there that trawling with steam power originated from British ports, and it was some years before British fishermen lost their monopoly of that branch of the industry; but steam trawlers eventually began to issue from all the conti-

and large quantities of mackerel taken in nets are thrown overboard. Thus in September 1904 one boat landed 60 crans of fine mackerel at Kyle of Lochalsh. (A cran of mackerel contains an average of 400 fish). Forty crans were sold fresh at eight shillings a cran, and 20 crans were thrown away as there was no means of curing them.

While the local herring fishery is actively pursued from almost every creek approached by the fish, powerful boats from Yarmouth,

nental ports in the North Sea, and now they come from Spain, Portugal, Iceland, Russia and Italy. Outside the North Sea, powerful steam trawlers and liners from the eastern ports of England and Scotland carry on operations in far distant waters off Iceland and the Faroe, off the coast of Portugal and Morocco, etc., and earn handsome profits both in the home market and in foreign ports. The fish so caught and landed abroad do not figure in the returns quoted in Table II. "For instance, one English trawler fishing off the French coast near Brest, in 70 fathoms, took 300 kits of fish which, in the Lisbon market, some 600 miles distant, realized £444. On the next day the same vessel commenced fishing off Cape Finisterre, in 120 fathoms, and in four days returned to Lisbon and sold some 200 kits for £378."\*

Steam power, at first only employed in trawling vessels is becoming annually more common in drift net and long line fishing; motor propulsion, as aforesaid, being steadily on the increase, not only for small boats, but, on the East Coast, to boats of from 20 to 45 feet keel, intended primarily for line fishing, but also used for herring fishing near the coast. Drift nets are employed for taking herring, mackerel and pilchard. The relative value of these fisheries may be estimated from Table V.

Lowestoft, Grimsby, and 10 other principal English ports, and from Eyemouth, Leith, Fraserburgh, Buckie and 14 other Scottish ports seek the fish irrespectively of distance or locality. East coast fishermen generally are far more enterprising and industrious than those on the west coast of Great Britain and Ireland. The reason for this appears to be connected with ethnology, men of Anglo-Saxon and Scandinavian blood taking far more readily to the sea than those of the Celtic race. A large proportion of the fish landed on the west coast of Britain and in Irish waters are taken by east coast fishermen; and in those places on the west coast where the local industry is most active, such as Stornoway in Lewis, Peel in the Isle of Man and Morecambe Bay in Lancashire, there is a strong Scandinavian strain in the population, derived from the long period when these districts remained under Norse dominion. The British export trade in fish, both fresh and cured, is very large, as shown in Table VI.

The European War has completely dislocated this trade. Germany and Russia had previously been the chief customers for cured herrings, taking between them about four-fifths of the whole export, notwithstanding the German import duty of three shillings a barrel and

The mackerel fishing on both the east and west coast of Scotland is capable of indefinite expansion if curing stations were established. Mackerel are regarded with disfavor in many parts of Scotland as an article of food; fishermen dislike them because they believe, not without reason, that they drive away the herring,

the Russian of 13 shillings a barrel. The United States takes the larger part of pickled mackerel from the Irish fisheries, and pilchards find their principal market in Italy.

It is not a little remarkable that, notwithstanding the large exports of fish from the United Kingdom, there are also very large imports, to the value in 1913 of £5,030,499, whereof £3,312,958 was for fish, including shell-fish and

\*Board of Agriculture and Fisheries, 1904, p. 22.

turtles, imported from foreign countries, and £1,717,541 for imports from British possessions overseas. The value of canned salmon imported from the United States was £698,018, and from Canada £900,068.

Considerable friction has arisen in the past between trawlers and line-fishers, owing to the destruction of lines laid upon ground whereon trawlers work. Parliament considered it undesirable that the more ancient industry of line-fishing, often pursued by men of humble means, should be sacrificed to the interest of persons of capital, residing, it might be, far from the fishing grounds. It was also deemed expedient to protect young and undersized fish from destruction by trawls. Statutory powers accordingly have been conferred upon the fishery boards of the three kingdoms to schedule certain areas, specially suitable for spawning ground, within which trawling is prohibited. But whereas certain of these scheduled areas, such as the Moray Firth, include water outside the three-mile territorial limit, the jurisdiction of British courts cannot apply to foreign trawlers working within the prescribed area,

fishing villages on the east coast of Scotland, he observed:

"Fishing is to be carried out no longer by more or less independent crews, bound together by blood relationship or other ties, whose working hours were largely regulated by the weather and tides, or their own convenience and necessities. Yet their whole domestic life was interwoven with the time-honored pursuit. Their wives and daughters laboriously baited the hooks and arranged the lines in the baskets for 'shooting'; they gathered the bent grass for separating the layers of the line, and, with the sons, dug lug-worms or procured the mussels for bait. . . . Now, active and powerful vessels, propelled by steam and this more or less independent of weather, manned by a captain responsible to owners or their manager, a crew bound together only by discipline and pay, with a fishing apparatus requiring no bait, appeared on the field. . . . Capitalists took up the question and fitted out powerful ships—both in England and Scotland, and sent them into Scottish waters, so that liners met with most formidable rivals."

TABLE VI—EXPORTS OF BRITISH FISH IN 1913.

	Fresh		Cured or salted

but outside the three-mile limit. Consequently, fish may be and are taken by foreign trawlers upon ground closed to British trawlers by the act of their own legislature; the fish so taken may be and, before the war, were landed in British ports to the intense indignation of the native fisherman. Meanwhile, scientific opinion is not unanimous upon the question whether the closure of these areas has any appreciable effect upon the general stock of fish in the adjacent seas; but it is undoubtedly favorable to line fishermen, to whom the prohibition does not apply.

The importance of the fishing industry as a nursery and reserve of practised seamen can hardly be overrated in a maritime nation, nor need it be apprehended that the progressive displacement of sails and oars by steam and internal combustion engines will impair its value in that respect. Any fears that may have been entertained on the subject must have been dissipated in view of the magnificent service rendered by thousands of British and Irish fishermen since the outbreak of the war in August 1914. Unfortunately, the nature and extent of that service may never be understood by the general public, nor the danger which these hardy fellows have willingly faced in exchanging their peaceful industry for the hazardous duty of mine-sweeping and patrolling the coast.

Upon the social system of regular fishing communities the advent of steam and motor engines has had a considerable effect. So long ago as 1883 Professor Mackintosh foresaw and noted the coming change. Writing about the

It should not be understood from this that the "capitalists" referred to are wealthy landmen speculating in an enterprise wherein they have personally no part. It is true that many trawlers and drifters are owned by companies, but these companies usually consist of men who have been fishermen, or at least seafaring men, from their boyhood and who have combined their resources so as to acquire suitable vessels and gear. Immense sums have been advanced by joint stock banks both to such companies and to individuals, and the industry is so profitable that loss on the transaction has very seldom been incurred. If steam has invaded the province of local fishermen on one hand, it has brought them advantage on the other by giving them access to distant markets.

The stern realities of a sea fisherman's life have imparted gravity to the demeanor of this class in all parts of the coast. Were it possible to obtain statistics, probably they would prove that the sea-fishers are among the most orderly and law-abiding in the community. The fishwives of Musselburgh and Newhaven have preserved among them what is almost, if not quite, the sole survival of national costume in everyday wear. The short, heavy pleated, dark skirt, the woolen hose and serviceable shoes, the gaily striped "bed-gown" or blouse and the coat of thick pilot-cloth, are probably identical in form and material with those worn by the fishwives who watched Queen Mary landing at Leith in August 1561. In those days, and for 300 years later, the fish-wives used to

\*"The Resources of the Sea" by Professor Mackintosh (1899).

trudge up daily from the seaports in the Forth to Edinburgh, each with a heavy "creel" of fish on her back supported by a leathern band across the forehead. They come up by cheap trains now, but still their picturesque dress and archaic equipment afford a welcome relief to the uniformity of a modern metropolis and the by-streets still echo to their hereditary cries of "Caller Herrin!" "Caller haddies!" "Caller oo!" (oysters).

**Inland Fisheries.**—With the exception of salmon, fresh-water fishes have been turned to less commercial account in the United Kingdom than, probably, in any other country of Europe. As a feed supply they are reckoned of no account, save that a considerable revenue, from £10,000 to £15,000 annually, is derived from the eel fisheries of Ireland.

All fresh water fish except salmon and trout are classed as "coarse fish," and are regarded of no market value; but in England and Wales an annual close time was provided for these by the Act of 1878, in the interest solely of anglers, who may be numbered by tens of thousands in the industrial districts, organized in fishing clubs and taking part in frequent angling competition.

For salmon there is a statutory annual close time in all three kingdoms, the minimum duration in England and Wales being 154 days for nets and 92 days for rods. In Scotland and Ireland the minimum for nets is 168 days, and in all three kingdoms a weekly close time for nets is fixed, varying from 36 to 48 hours. There is no weekly close time for rods, except that rod-fishing for salmon is illegal in Scotland on Sundays. The annual close time for trout varies in different districts throughout the United Kingdom.

In the absence of any statutory obligation on the owners or lessees of salmon fisheries to render returns of their catches, it is impossible to obtain accurate information as to product of these fisheries. Through the courtesy of railway and steamship companies the weight of salmon carried to market is known approximately. Thus taking the average of eight consecutive seasons, it appears that there were delivered in Billingsgate Market, London, the number of boxes shown in Table VII, each box weighing about 100 weight.

TABLE VII.—AVERAGE ANNUAL NUMBER OF BOXES OF SALMON DELIVERED IN BILLINGSGATE MARKET FROM BRITISH AND IRISH FISHERIES DURING EIGHT YEARS.

English and Welsh.....	1,435 boxes
Scottish.....	13,117 "
Irish.....	4,262 "

Total annual average..... 18,814 boxes

Facilities of travel in all parts of the United Kingdom have immensely enhanced the value of angling rights for salmon and trout. The rents now paid by sportsmen for salmon fishing and, within easy reach of London and other great cities, for trout-fishing, are such as would have appeared fabulous a couple of generations ago. Owners of inland and estuarine salmon fisheries have begun to realize that anglers are willing to pay higher rents for their sport than net-fishers can offer for the exercise of their industry. The result has been the limitation, and in many upper waters the abolition, of net-

fishing. Nor has this tended to stint the supply of salmon to the market, for the consequence of admitting more fish to the spawning grounds has been to increase the general stock of salmon to the advantage of coast and estuarine net fisheries.

**Whale Fishing.**—There remains to be noticed an industry of recent introduction into British waters which is classed as a fishery, although the object of capture is not a fish but a mammal. Previous to the invention by Captain Svend Foyn in 1865 of a bomb-harpoon to be fired from a small cannon, the mighty fin-whales—i.e., the blue whale (*Balan optera Sibbaldi*) and the rorqual (*Balanoptera musculus*), both of which abound in the North Atlantic, were reckoned too formidable to be hunted. Now, however, steam whalers armed with Captain Foyn's guns enable the crews to attack the most powerful finners and in 1903 fishing stations were established in the Shetland Islands by Norwegian companies. In 1913-14 there were 13 steamers engaged in the fishing and the total number of whales taken in the 12 seasons, 1903-14, was 6,272, the value being estimated at about £627,200. Two whaling companies have been established in Ireland, each with two steamers. In 1913 they landed 114 whales, viz., 95 rorqual, 5 blue whales, 13 sperm whales and 1 humpback.

HERBERT MAXWELL, F.R.S., LL.D., D.C.L.  
Lord Lieutenant of Wigtownshire.

**31. THE MINING INDUSTRY.** When it is considered that mining enterprise in Great Britain and Ireland accounts, at the present time, for the employment of no less than 1,236,210 persons directly engaged in the production of 354,890,867 tons of minerals estimated to be worth, at the mines and quarries from which they are drawn, the sum of £160,112,607, the vastness of the industry, and its effect on the economic life of the country will perhaps be more fully realized than by the recital of detailed descriptions of the various branches of mining. Indeed it may be said that the wealth of Britain is mainly due to the unique position, mineralogically, that it occupies relatively to other nations; for no country contains proportionately to its area, so great or so varied a store of mineral wealth.

Mines in the United Kingdom are usually treated as coming within one of two categories, viz.,<sup>1</sup> metalliferous mines, and<sup>2</sup> those which

<sup>1</sup> These figures are derived from the 'Mines and Quarries Statistics,' published annually in four parts by the Home Office as a Blue Book, comprising District Statistics, Part I; Labor, Part II; Output, Part III; Colonial and Foreign Statistics, Part IV. The figures are, except where otherwise

are governed by the Coal Mines Act, the latter comprising chiefly coal and stratified ironstone mines, and being by far the most extensive and important section, though a development of later growth, having expanded through seven centuries to be what, as judged by some, is believed to be the zenith of their development.

Of the metalliferous deposits<sup>1</sup> mined in the United Kingdom, the most important are, and have always been, the ores of tin, copper, lead and iron. Native silver has never been worked, and it is doubtful whether it occurs in Britain or Ireland, although Strabo writing about 19 A.D. mentions silver as well as gold as being among its products.<sup>2</sup> Tacitus also makes reference to it indirectly.<sup>3</sup> Gold is very sparsely disseminated, occurring in mineral veins, found chiefly in Merionethshire<sup>4</sup> (North Wales), Lanarkshire (Leadhills, Scotland) and Cornwall; and in some alluvial deposits in Sutherlandshire (Scotland) and Wicklow (Ireland).

Probably the earliest mining on commercial lines in Britain was that of tin. The "cassiterides,"<sup>5</sup> whence the Phœnicians obtained their British tin, were, in all probability, what are now known as Scilly, the Channel Islands, and, more particularly, Cornwall. The industry is and always has been restricted to Cornwall and, to a very small extent, to the contiguous part of Devon, and as early as 60 a.c. we find Diodorus Siculus describing the tin trade of these parts. In the early years of the 19th century (1817) Cornwall was the chief source of production of the world's supply of tin, now it stands fifth on the list of tin producing countries, contributing only 4.25 per cent of the total production.

What has been written

of tin is also largely true of copper. Carew<sup>6</sup> said, writing about 1600, that he could not find that it was being profitably worked in the west of England, yet nearly two centuries later, the production<sup>7</sup> (during the decennial period 1766-75) was abnormally large, and as late as 1888 we find no less

FIG. 1—SHOWING THE FLUCTUATIONS IN THE PRICES OF COPPER, LEAD, TIN AND ZINC IN THE LONDON MARKET FOR EACH YEAR SINCE 1873. (The thick lines show the highest prices and the thin lines the average prices.)

stated, those for the year 1913—the year before the war. The figures if taken during war years would not constitute reliable comparisons.

<sup>1</sup> Final 'Report' of the Royal Commission on Coal Supplies. This commission was appointed in 1903 and published its final report in 1905.

<sup>2</sup> The limited extent of metal mining (exclusive of iron ore) is evidenced by the fact that only 26,406 persons were employed during the year 1913 in producing metalliferous minerals other than iron and minerals commonly designated as "non-metalliferous" such as barites, gypsum, limestone, oil shale, rocksalt, sandstone, slate, etc.

<sup>3</sup> Book IV, Chap. 279. Clearly some process of extraction of silver from rich silver-lead ore (galena) must have been in vogue.

<sup>4</sup> In the life of his father-in-law—'Vita Agricole.' Agricola in an oration to his soldiers before the battle, near the Grampians (84 A.D.) exclaims: "*Peri Britannia aurum et argentum et alia metalla, pretium victorie.*"

<sup>5</sup> The Occurrence of Gold in Great Britain and Ireland, by J. Malcolm MacLaren, B.Sc., P.G.S., in the 'Transactions'

of the Institution of Mining Engineers, Vol. XXV, pp. 435-508. Hence, "cassiterite," or oxide of tin, the commonest ore of that metal.

<sup>7</sup> 'Tin Deposits of the World,' by Sydney Fawns, P.G.S. For a clear statement of the present position of Cornish tin mining, the articles which appeared in the Engineering Supplement of the 'Times' (Sept. 27, Oct. 18, 1905) should be consulted. Tin mining, in the strict sense of the term, probably dates from the 11th century, before that time the whole of the tin being derived from "Stream Works." In 1884 the British output of tin ore amounted to 15,117 tons of tin ore (black tin), worth about £40 a ton; the product has year by year decreased, until during 1913 the output was only 8,355 tons, worth about £115 a ton. The price of metallic tin was in 1912, £212,11.0, a ton, the highest recorded price of English black tin. The average price during 1913 was £204.6.8

<sup>6</sup> Carew, Richard, of Antioine, 'Survey of Cornwall.'

<sup>7</sup> William Pryce in his 'Mineralogia Cornubiensis' gives the output as 264,273 tons of copper ore during this period, averaging in price £6.14.6 per ton.

an authority than the late Mr. D. C. Davies<sup>10</sup> stating that *for their size* the British Islands constitute the greatest copper producing country of the world, but the production has greatly dwindled since the time he wrote. Cornwall and Anglesea are the chief copper bearing districts in the kingdom, and very remarkable profits have, in times past, been derived from some of the mines.<sup>11</sup>

The production of lead far exceeds that of tin and copper,<sup>12</sup> and as in the case of tin and

which is preserved in the Geological Museum in Jernyn street. It may be mentioned of this district that, though possibly the smallest mineralized area in Europe, it was believed by so great an authority as the late Sir Roderick Murchison<sup>13</sup> to be probably unequaled for its size, in point of wealth in lead ore.

In Shropshire, North Wales, Cornwall, Isle of Man, and the Pennine Chain are situated the chief lead mining areas of the kingdom. Lead mining in general had not of late years—until

the last year or two—been very profitably conducted in the United Kingdom. Though far from being exhausted, except in few instances, the mineral veins are not of such a character as to allow of their being as cheaply exploited as the richer deposits of Spain, Australia and some other extensive lead-producing countries. As these more bountiful districts become exhausted, one is justified in assuming that British lead mining will be more extensively developed.

Fig. 1 shows diagrammatically the fluctuations in the prices of copper, lead and zinc in the London market for each year since 1873 to 1913 inclusive.

The iron ore deposits of Great Britain<sup>14</sup> are of two kinds, viz., stratified iron ore—the mines of which come under the control of the Coal Mines Regulation Act—and the “mass” and “veined” deposits of hematite which come within the jurisdiction of the Metalliferous Mines Act. Cumberland and North Lancashire which yield an output of nearly one and a half million tons, are the source of the famous red hematite

which chiefly occurs in the form of huge irregular masses in the carboniferous limestone and is the richest iron ore of the country, yielding on the average over 50 per cent of metal. Working one of these masses is probably the most extensive iron mine in the world—Hodbarrow mine.<sup>15</sup> The other principal iron producing districts are Cleveland (N. Yorkshire), which accounts for nearly six million tons annually; Lincolnshire, Northamptonshire and Leicestershire together supplying nearly six

mines in this district is obtained by precipitation of the copper in the waters pumped from the mines.

<sup>10</sup> The output of lead ore for 1877 was 80,850 tons, valued at £1,123,952, whereas during 1913 it amounted to but 24,282 tons, valued at £293,525. Vide ‘Mines and Quarries Statistics.’

<sup>11</sup> Sir Roderick Murchison, F.R.S., director of the Geological Survey of Great Britain, ‘The Silurian System’ (1839, p. 282). He says, “we shall find there are few tracts of given extent in any part of the world which are veined to a greater extent.”

<sup>12</sup> ‘The Iron Ores of Great Britain and Ireland,’ by J. D. Kendall, F.G.S., affords much reliable and valuable information on this subject.

<sup>13</sup> The output of ore from this mine during 1913 was 396,657 tons.

FIG. 2—SHOWING THE FLUCTUATIONS IN THE PRICES OF COAL AND IRON FOR EACH YEAR SINCE 1873. (The thick lines show the highest prices and the thin lines the average prices.)

copper, signs of a revival are not wanting, still, it is very doubtful whether this branch of mining in the United Kingdom will in the near future attain to a similar state of prosperity as that experienced about the year 1877. Lead mining in these islands is of considerable antiquity; we know that lead ore was mined in Shropshire in the days of the Emperor Hadrian from the fact that “pigs” of lead were some years ago discovered in the refuse heaps of the Roman Gravel Mine in that county, one of

<sup>10</sup> ‘A Treatise on Metalliferous Mines and Mining,’ p. 125. Davies instances the fact, drawing his information from Hunt’s ‘Mineral Statistics of Great Britain and Ireland,’ that in the year 1877 there were 101 copper mines at work in the kingdom, producing an aggregate of 79,252 tons of ore, valued at £317,186 7.7; of these mines 65 were in Cornwall. In 1863 the production of copper ore and copper precipitate amounted to upwards of 210,000 tons, valued at over a million pounds sterling. The output of copper ore (and copper precipitate) during the year 1913 was only 2,732 tons, valued at the mines at £27,029.

<sup>11</sup> Pennant’s ‘Tour in North Wales.’ The Parys Mine, in the northern corner of Anglesea, worked for a long time and in a century and a quarter returned profits estimated at over £7,000,000. The copper at present derived from the

and a half million tons, the total production being nearly 16 million tons annually, valued at over four and a half millions sterling.<sup>10</sup> The Cleveland clay ironstone (carbonate of iron) is chiefly worked from a bed about 10 feet thick, in the Middle Lias, containing on the average about 30 per cent of iron. The ore from Lincolnshire, Northamptonshire and Leicestershire is derived from open workings in a bed of brown iron ore in the Inferior Oolite, and averages about 33 per cent of metal. The Scottish ore and that from North Staffordshire is largely worked from the Black Band ironstones (carbonate of iron) in conjunction with the coal in the collieries of those districts and varies considerably in richness of metal.<sup>11</sup> Fig. 2 is a graphic representation of the fluctuations in the price of coal and iron (London market) for each year since 1873 up to and including 1913.

A description of British mining would be incomplete without some reference to the production of slates,<sup>12</sup> as in no country are there yielded slates of a quality equal to those of North Wales. The mines proper are mostly in Merionethshire, whereas the quarries are worked in Carnarvonshire, the Penryn quarry, near Bangor, being the largest open working in the world, the underground workings of the Oakley Slate Quarry Company, Ltd., at Festiniog, Merionethshire, being the most extensive slate mine. The output of finished products from the individual mines and quarries constitutes only a part of what is drawn from the workings, it being calculated that there is a loss of about two-thirds in the "dressing" (cutting and shaping) of the slates.

No description is given in this review of the production of building and other stones, derived chiefly from quarries, as space does not permit of allusion to other than the more purely mining part of the subject.

The chief sources of the mineral wealth of the United Kingdom are the coal and iron deposits. Of the latter mention has already been made. The former far outweighs in importance all other branches of mining classed together.

Until the year 1899 the United Kingdom

was the largest producer of coal in the world (see Fig. 3); it now stands second, the United States having outstripped it in the race for supremacy in this respect.

When coal first came to be worked in this country as a merchantable article, authorities are not agreed. It may have been worked in a desultory and uncertain fashion in very remote times, but the first substantial mention of coal

mining is that contained in the records of Holyrood and Newbattle Abbeys,<sup>13</sup> in which it is shown that coal was dug on the south shore of the Firth of Forth in Scotland about 1200 A.D.; further, we know that coal was imported into London from Newcastle about 1257 A.D. Indeed, Novacastrians may justly claim the banks of the Tyne as the nursery of the coal trade, and to the present day the inhabitants have more than maintained their heritage of

<sup>10</sup> The figures of 1913 give a total production from all classes of mines and quarries of 15,997,328 tons, valued at £4,543,358. 'Mines and Quarries Statistics.'

<sup>11</sup> The output of the various kinds of ore may be roughly proportioned as follows: Clay ironstone, 42 per cent of the output; black band, 9 per cent; hematite (red), 12 per cent; brown ore, 34 per cent.

<sup>12</sup> The total production of slates during 1913 was 370,756

tons, valued at £926,739. North Wales furnishes most of the slate, roughly speaking, in the proportion of two-thirds from open workings and one-third from mines.

<sup>13</sup> For an exhaustive and admirable history of coal mining in Great Britain, the reader cannot be referred to a more interesting and accurate record than the 'Annals of Coal Mining and the Coal Trade' (2 vols.) by R. L. Galloway.

skill and foresight, for there is no field in which the mining industry rejoices in better management, both in respect of the mining operations themselves and in the conduct of labor affairs, than the Great Northern coal field. The systems of "joint committees" of representatives of owners and men, and the respective associations of mine owners and of the workmen in Northumberland and Durham have constituted a pattern to be studied and an example to be followed by other mining districts, and have conducted in an eminent degree, to the equitable conduct of the trade and the harmonious relations existing between employers and workmen.

There is, perhaps, no trade, excepting the iron-making industry, more subject to variations of prosperity and depression than coal mining. It is often remarked that it is the first to prognosticate a cycle of general depression and the last to recover therefrom. Be that as it may, the words of the old chronicler<sup>16</sup> have a strangely modern ring about them, when read in the light of recent experience. "Many thousands of people," he remarks, "are employed in this trade of coales: many live by working of them in the pits: many live by conveying them in wagons and waines to the river Time: many men are employed in conveying coales in keeles from the stathes aboard the ships; one coal

merchant employeth five hundred or a thousand in his works of coals: yet for all his labour, care and cost, can scarce live by his trade. . . . Nay, many of them hath consumed and spent great estates and dyed beggars." The conclusion of the whole matter appeared to him to be that "their Collieries is wasted and their monies is consumed; this is the uncertainty of mines—a great charge, the profit uncertain."

It is not proposed to follow the history of development of the coal trade in detail. The rate of this expansion and how it has been affected by various improvements in mining and facilities of transport are marked in the accompanying diagram, Fig. 4.<sup>17</sup>

One of the most remarkable characteristics of the carbonaceous deposits of this kingdom other than the number of the separate fields and their extensive area is the great variety in the fuel itself. The coal fields may be divided into groups as follows:<sup>18</sup>

#### I. ENGLISH COAL FIELDS.

- Midland Group.**—(1) North Staffordshire; (2) South Staffordshire; (3) Leicestershire; (4) Warwickshire.
- North Midland Group.**—(1) Yorkshire; (2) Derbyshire and Nottinghamshire.
- Great Northern Group.**—(1) Durham and Northumberland; (2) Cumberland.
- Northwestern Group.**—(1) Lancashire and East Cheshire; (2) Coalbrookdale (or Shropshire); (3) Forest of Wyre.
- Western Group.**—(1) Bristol and Somersetshire; (2) Forest of Dean.

#### II. WELSH COAL FIELDS.

- (1) South Wales; (2) Denbighshire and Flintshire.

#### III. SCOTTISH COAL FIELDS.

- (1) The Clyde basin; (2) Midlothian and Haddingtonshire; (3) Fifehire; (4) Ayrshire; (5) Lesmahagow; (6) Canonbie.

#### IV. THE KENT COAL FIELDS.

The development of which has only very recently been commenced.

#### V. IRISH COAL FIELDS.

- (1) Northern Group; (2) Southern Group. These are of small importance and little worked.

<sup>16</sup> Grey, 'Chronographia, or a Survey of Newcastle-upon-Tyne,' published 1649.

<sup>17</sup> After J. B. Simpson, M.I.C.E., *vide*, Address on the 'Rise and Progress of Coal Mining' (1896), the diagram has been further extended and brought up to date thus:

Long tons, 2,240 lbs.	
In the year 1660, it was estimated by the Royal Commission on coal (reported 1871) that the output of coal was . . . . .	2,148,000
And that in 1770 it had risen but little, being but . . . . .	2,612,000
Between 1770 and 1780, however, steam was applied to draining mines, and gun powder came to be used at underground operations, so that it was estimated that by 1780 the output had advanced considerably, being for that year . . . . .	4,773,828
Later steam was applied to hoisting the coal up the shafts, and between 1760 and 1800 the development of the canal system took place, which gave a great impetus to the trade. So that for 1880 the output had increased to . . . . .	10,080,300
In 1803 coal came to be used for the manufacture of gas, and in 1815 the safety-	

lamp was invented, which would further assist coal mining. Mr. Samuel Salt computed the output for 1816 to be . . . . . 27,020,115 |

For 1845 Mr. J. R. McCulloch puts the output at . . . . . 34,600,000 |

The introduction of steam in navigation and the development of the railway system took place shortly before and about this time.

The (1871) Royal Commission on Coal, sometimes called the Argyll Commission, the Duke of Argyll being its chairman, calculated that in 1855 the output had risen to the considerable figure of . . . . . 64,307,000 |

The first year of which we have official returns is 1860. The following figures show the increase:

1860	84,042,698
1865	98,150,587
1870	112,875,575
1880	146,969,409
1890	181,614,288
1900	227,084,871
1905	236,111,150
1910	264,433,028
1913	287,430,473

The thickness of the seams worked in the fields varies from 11 or 12 inches to 30 feet, but the latter is restricted to South Staffordshire; this seam and the thick coal of Warwickshire being quite exceptional. Cannel coal in Scotland has been worked, in some instances, when only six inches thick.

The variation in the character and quality of the coals within the different fields themselves is remarkable; for instance, first class coking coal is mined near the banks of the Tyne, yet only a few miles east of Newcastle the world-famed Wallsend household coal is produced, and by far the greater part of the Northumbrian output is exported as steam coal. Again, coke unrivaled in quality, is made from the coal mined in the western and south-western part of Durham, whereas good gas and very superior house coal is raised from the collieries situate in the central and eastern part of the same county.<sup>1</sup> The principal steam coal-producing areas, other than Northumberland, are South Wales (pre-eminently), and parts of the Scottish fields — notably that of Fifeshire — to some extent Lancashire, North Staffordshire and Yorkshire; the other fields chiefly supplying manufacturing, iron smelting, gas and coking coals. Of all the districts, the variation in character of coal is most marked in the great South Wales field, in the south and southeast the seams of the lower shale series are bituminous in the middle and semi-bituminous, farther toward the northwest they are what is technically termed "dry" (i.e., contains very small percentage of volatile hydro-carbons) or steam coal, still further in the same direction they are semi-anthracite (i.e., still drier), and to the northwest and west again they are anthracites. The seams of the Pennant series, higher up in the coal measures, follow the same rule in transformation, but have a higher scale of bituminosity in comparison with the seams below them.<sup>2</sup>

A factor that must largely affect the future commercial prosperity of the country, indeed is vital to it — is the duration of its iron and coal supplies. The stores of iron ore, owing to the nature of the deposits, cannot be estimated with the same degree of accuracy as is possible in the case of coal, but it may be safely prophesied that their exhaustion will long precede that of coal. Working on the figures arrived at by the late Royal Commission on Coal Supplies, the time which would be taken to exhaust the coal fields at the present rate of output may be taken as about 600 years;<sup>3</sup> whether the present rate of output will be long maintained is, however, somewhat doubtful. For the last 40 years the average increase in the output has been, roughly, 2½ per cent per

annum, and that of coal exported 10 per cent per annum, or put in another way the percentage of output shipped abroad from 1878 to 1912 inclusive has increased from 16.1 to 32.4 and in 1913 it reached the record figure of 34.2, but it is highly improbable, owing to physical reasons, that these rates of increase will be long continued. Some districts, indeed, have already attained their maximum, and decadence has set in, as for instance in the "exposed" part of the South Stafford coal field. The developments in the new coal fields will possibly increase the total output for some years, but the Royal Commission, just alluded to, "look forward to a time, not far distant, when the rate of increase of output will be slower, to be followed by a period of stationary output, and then a gradual decline." Nor do they hold out any hope that the resources may be husbanded by the utilization of any other source of power; they are convinced "that coal is the only reliable source of power and that there is no real substitute, though there are some sources which may slightly relieve the demand for coal."<sup>4</sup>

SIR R. A. S. REDMAYNE, K.C.B., M.Sc.

*H. M. Chief Inspector of Mines, Late Professor of Mines in the University of Birmingham, Past President Institution of Mining and Metallurgy, Member Institute of Civil Engineers, Fellow of the Geological Society, etc., etc.*

### 32. THE INDUSTRIAL REVOLUTION.

Between the years 1770 and 1840 England became the workshop of the world. She changed radically in character; from an agricultural nation she became primarily a manufacturing one. She became dependent for her raw materials on foreign nations and on markets abroad for the sale of her goods. Her international position, therefore, was vastly affected and her prosperity became dependent on the state of trade. No less remarkable was the change in the relations of persons. A new middle class of manufacturers arose and the moneyed interest permanently overtopped the landed interest in social importance. Alongside of the employing class grew up the class of factory hands, and the business relations of the two classes had to be settled afresh and not without considerable friction. The industrial revolution involved, therefore, industrial reconstruction with all the disintegration and suffering that drastic reconstruction always causes.

Not more striking than the alteration in the character of English industry and in English social relations was the remarkable shifting which took place of centres of importance, for suddenly the North sprang into prominence and the South correspondingly declined. In this

<sup>1</sup> The extent to which the different fields contribute to the total production may be roughly proportioned as follows:

	Million tons
Scottish coal fields	42½
Northumberland, Cumberland and Durham	58½
Lancashire and North Wales	78
English coal fields	23
Yorkshire and North Midlands	28
Midland and Southern (Stafford, Leicester, Warwick, Gloucester, Somerset and Kent)	28
South Wales, including Monmouthshire	57
Ireland	½

<sup>2</sup> Professor Hull's 'Coal Fields of Great Britain' (sixth edition) should be consulted by the reader interested in further pursuing this subject.

<sup>3</sup> The annual output of anthracite is nearly 3,000,000 tons, practically derived entirely from this region.

<sup>4</sup> Reports of Royal Commission on Coal Supplies. Final Report, 1905. The Commissioners computed that there were yet remaining to be worked in the "proved" coal fields, adopting 4,000 feet as the limit of practical depth in working and one foot as the minimum workable thickness, an available quantity of coal equal to 100,914,668,167 tons, and that the quantity supposed to exist outside the "proved" area, i.e. in the "concealed" fields, would amount to 39,483,000,000 tons. In calculating the period of duration there has not been taken into consideration the coal existent at a depth below the 4,000 feet limit, which in the "proved" coal fields alone is placed at 5,239,433,980 tons.

new industrial region huge masses of people were congregated on certain spots, and the problem of the large towns arose, with all the sanitary housing and other questions connected therewith.

Then came the problem of feeding these agglomerations of people and of getting rid of the goods they made, which questions were answered by the great revolution in the means of transport and the changes in the English fiscal system.

The industrial revolution is generally dated from the coming of machinery and is usually connected with the invention by Arkwright of a cotton-spinning machine in 1775 which was worked by water. It was the application of mechanical power to industry that constituted the novelty, for it was the invention of a substitute for man himself.

But events had been preparing for more than half a century for the introduction of manufacturing on a large scale in England. Inventors had always been numerous, but the conditions were present about 1770 which enabled an inventor to bring his ideas to a successful issue. In the first place there was in the England of that time an abundance of capital, owing to the development of the banking system, so that an enterprising man could get money to try experiments. Arkwright's machine is said to have cost \$60,000 before it was perfected. Then, too, there was every prospect of large sales, without which machine production would have been unnecessary. England's markets were developing steadily in the 18th century, both at home and abroad. At home the revolution caused by smelting iron with coal had given rise to canals to transport the fuel and the result was a general quickening of intercommunications. New centres rose up and a greater demand for goods was created. The export of English goods was steadily rising in value and there was every chance of increasing the sales if goods were cheaper. Moreover in the 18th century the capitalist employer had become prominent. There was, therefore, a class of men trained to production on a large scale. The old mercantile companies with their rules as to limited sales had lost their power to dictate as to quantities and prices and there was no hindrance on that side to the enterprising man.

Yet although these forces were all making for a great change in the methods of industry the England of 1760 was an agricultural country. The leading branch of trade was cloth; cotton goods and muslins were imported from India and re-exported; fine cotton goods could not be made in England as the warp was too weak and linen had to be used. The iron trade had been threatened with extinction owing to the lack of timber and was only just beginning to revive when coal could be utilized for smelting owing to the invention of the Darbys about 1740; but much remained to be done, and it was not until Cort's invention of a means of puddling iron in 1784 that the iron trade made great advances.

In 1760 the Duke of Bridgewater was cutting the first canal and the turnpike roads were beginning to facilitate internal travel.

The majority of the work-people were either small manufacturers who bought the wool, wove it, and disposed of the cloth themselves, or

worked on commission for some big-dealer. Nearly all of them had a by-employment in the shape of a small farm, while the women and children practically all over England were employed in spinning or carding. The incomes of the day were family earnings. As English cloth had almost a monopoly value the demand was steady; England grew the bulk of her own wool and was not mainly dependent on importation from abroad. The characteristic of the whole period was stability. If the orders for cloth fell off then the man had his bit of farm to fall back on—the one helped the other. Agriculture was not divorced from industry nor the workman from country employment, nor was there any marked distinction between town and country. It is probable that according to our notions the life was sordid and the standard of comfort low, and there is no reason to think that the parents were the easiest of taskmasters for the children. But the problem of the unemployed was absent, and the domestic workmen at all events decidedly preferred the life to that of the factory.

When machinery came it was curiously enough first of all applied to the languishing trade of cotton. The reason seems to have been that the supply of raw cotton was unlimited, while England was already on the verge of a wool famine. Sheep growing had not been started in Australia and there was no reason to anticipate that even if machinery came in the output would be largely increased. Moreover wool being more brittle than cotton it was found at first very difficult to adjust it to the strain of the machine without constant breakages. Hence wool is affected by machinery much later than cotton. Arkwright, a barber, revolutionized the cotton trade by his water frame, patented in 1775, which spun a yarn firm enough for the warp. Crompton followed this up by inventing the mule in 1775 which created the muslin trade; and Cartwright, a clergyman, brought out the power loom for weaving which was first used in 1801. Power spinning in the woolen trade did not become general till the first decade of the 19th century.

The effect of the cotton machines was to create a new trade. The great manufacturing centres had hitherto been Norwich and Devizes, but the new machinery needed water power, and hence the trade settled in the North in country districts where water was available. The first machines were small and simple; were made of wood and necessitated a good deal of bending over by grown-up persons. They could easily be worked by children, but such labor was difficult to obtain in the country in large quantities, hence the massing of pauper children in these factories. There seem to have been grave abuses in the system and a new era was inaugurated by the Health and Morals of Apprentices Act of 1802 which limited the working hours of apprentices to 12 per day.

The problem, however, was altered when steam came in owing to Watt's invention. It was only substituted gradually for water power, coming in more and more after 1815 and becoming the prevalent type altogether in 1840. The important thing now was no longer water but coal, and to get coal the factories had to settle in the great centres where coal could easily be brought by canal, as the cost of dragging it over country roads was prohibitive

for cheap production. Hence we get a second great migration of industry to the towns near the coal fields. Here child labor was readily available, and a new Act had to be passed in 1819 to meet the case of children who were not apprentices. As steam became more regularly applied the machinery got more complicated and less suitable for children of tender years, and there was a tendency to discontinue them in certain branches. They were still retained in the old water mills and the Factory Acts were never really effective till the invention of the government factory inspector in 1833.

There were practically no people dispossessed by machinery in the cotton trade; instead there were increasing opportunities of employment, but other trades suffered. The demand for both light woollen and linen goods fell off as cotton was substituted. Still the weavers prospered. They continued to work up the yarn in their own homes, and it was not until the dislocation of trade brought about by the Napoleonic wars that they fell upon evil days. Gradually machinery was applied to weaving, and the race of hand-loom weavers died out amid great privations.

It was when machinery was applied to wool, that the real social upheaval came. It destroyed the by-employment of spinning throughout the whole of the country districts, and an elaborate system of relief from the rates had to be devised to assist people over the crisis. This pauperized the whole of the south of England and degraded the agricultural laborers as a class.

The radical change in English life came that the real social upheaval came. It destroyed the old stability. A man had to follow his work to the towns and lost his little farm. Even when the factories were situated in the country he had to work regularly and could not take time off to attend to the garden as he could when working for himself. The regularity of the life, the tyranny of the factory bell, and the loss of independence were the things of which the worker most complained. The early factories, situated as they were in the country districts, laid the workmen open to an appalling system of payment in kind called "truck," an evil only gradually remedied by a series of Acts of Parliament beginning in 1831, and extended in 1887 and 1896 to all manual workers except domestic servants.

But more important than his dependence on his treatment by the master was the dependence of the workman on the state of trade. The sufferings during the Industrial Revolution in England were especially violent owing to the Continental System of Napoleon which shut out English goods from Europe except by smuggling between 1806-1812, and which was followed by the rupture with the United States, which cut off another very important market. After the peace of 1815 the utter exhaustion of the continent made Europe a bad customer, and England, equipped as she now was for production in bulk, suffered accordingly. The coming of machinery would have been a difficult time for any country, but the troubles were enormously aggravated owing to the fluctuations of trade and the depression after the war. English exports decreased in value between 1815 and 1825, and only began to recover about 1835, and to make a rapid advance in 1840. Nevertheless the in-

crease in trade when compared with that of 1750 was enormous.

The exports in 1750 were valued at £12,699,081; in 1880 they were £34,381,617; in 1840, £116,479,678. The imports in 1750 were £7,772,039; in 1800, £28,257,781; in 1840, £67,432,964.

The growth in the import of raw cotton is very striking. In 1751, 2,976,610 pounds were imported; in 1815, 99,306,343; in 1830, 259,856,000.

The import of wool could not expand till the Australian wool became available. In 1800 the number of pounds imported was 8,609,000; in 1840, 49,436,000; in 1857, 127,390,000.

Then the English fiscal system had to be overhauled to get in cheap raw material, and the agitation of the manufacturers was successful in bringing about the free trade era.

During the 19th century the English Parliament was mainly occupied in readjusting the relations of employers and employed, in facilitating the growth of a manufacturing state, and in abandoning the system which was made for an agricultural state; while no attempt has been made to preserve any balance between agriculture and industry.

The result of the industrial revolution in England was, to use the words of an 18th century writer, "to remove multitudes of people from our natural and fixed basis, land, to the artificial and fluctuating basis, trade." See also INDUSTRIAL REVOLUTION.

### 33. BRITISH TRADE UNIONISM.

English Trade Unionism is an indigenous product, which has remained singularly uninfluenced by any foreign movements or ideas. Disregarding the analogous combinations among journeymen during the Middle Ages, which in England seem to have been usually intermittent and temporary, and also the mediæval guilds of master-craftsmen and merchants—between which and modern Trade Unionism no actual affiliation or connection has yet been traced—we may say that Trade Unionism, in the sense of durable combinations of wage-earners for the purpose of maintaining or improving the conditions of their employment, have existed continuously from the latter part of the 17th

century. The earliest actual records known to us of such a combination is that of the woolen workers of the southwest of England, which is mentioned as existing in 1700, and frequently referred to in Devonshire, Somerset, Wiltshire, and Gloucestershire throughout the 18th century. The London tailors, too, can be shown to have been in continuous combination from at least 1720, when an Act of Parliament was passed to restrain them. Other Trade Unions known to have existed in the first half of the 18th century were those of the woolcombers, woolstaplers, and silkweavers. It was, however, apparently during the last quarter of the 18th century, when industrial conditions were being revolutionized in so many trades by the introduction of machinery, the factory system, production for export and the use of water or steam power, that Trade Unionism first became widely prevalent. Since that date, it is notable that the aggregate membership of Trade Unions in the United Kingdom has, with a number of temporary suspensions, persistently increased, until it now (1917) exceeds 4,000,000; organized in 1,100 different societies, possessing funds exceeding £6,000,000. As an institution Trade Unionism has, during the whole two centuries, and especially since 1824, when the first legalizing statute was passed, steadily increased in solidity, and continuously improved in its temper toward society and in the economic character of the methods employed to gain its end. In all these respects the improvement during the last 40 years has been most marked. Whatever may be the casual connection, if any, the historian cannot but record the fact that the character of English Trade Unionism has varied from decade to decade in close correspondence with the variations of the treatment which the community accorded to it. So rapidly and certainly has an improvement in English Trade Unionism followed upon measures of legalization and tolerance that were it not that it would seem to palliate inexcusable outrages of past times, we should be tempted to the epigram that each generation of citizens and the employers in each trade in each generation have the Trade Unionism that they deserve!

The form which Trade Unionism takes among the English wage-earners (and we may ignore for present purposes the Trade Unionism of other classes, such as lawyers, doctors, architects, accountants, surveyors, actuaries, teachers, etc.), is that of a voluntary association among the persons engaged in a particular trade, based upon the payment of weekly contributions—varying from two pence to two shillings—to a common fund which is administered by an elected executive, bound by an elaborate code of rules, and controlled by referendum votes of the entire membership, in such ways as are believed to promote the objects of the members. These objects are, first and foremost, the maintenance and progressive improvement of the conditions of employment of the wage-earners in the trade concerned, including not only the amount of wages, but also the method of remuneration, the form of the agreement, the hours of labor, the sanitation, safety and comfort of the operatives, and all the other conditions, explicit or implicit, of the wage-contract. Auxiliary to this fundamental object, and always subordinate to it, are the various "friendly benefits" afforded to members, which

may include maintenance payments to members out of work, whether from strikes or lockouts, or merely from slackness of trade; sick pay; funeral benefit on death of member or member's wife; accident benefit; insurance of tools against loss by fire or otherwise; legal assistance to members in litigation especially as regards compensation for accidents, and so forth. It is especially in the durability and financial solidity of the association, the multiplicity and amount of their friendly benefits, and the magnitude of their accumulated funds, that the principal English Trade Unions surpass those of all other countries. There are great Trade Unions (such as the Amalgamated Society of Engineers) which habitually enjoy an annual income of £4 per member; there are others (such as the Amalgamated Cotton Spinners) which possess accumulated funds exceeding £23 per member; there are others, again (such as the Boilermakers), which disburse on sick pay and medical attendance alone, more than £50,000 a year, including no less than £8,000 as salaries to the doctors in their employment. Among them all, the Trade Unions expend more than £400,000 annually in pensions of 5 to 12 shillings a week to their aged members, and nearly £120,000 in payment of their funerals; while a sum varying according to the state of trade from £400,000 to £1,000,000 is annually paid to members out of work, only from one-sixth to two-fifths of this, according to the state of the labor market, being for anything that can be called strikes or industrial disputes. But this strong financial position and these substantial friendly benefits are confined to the well-known leading Trade Unions. Out of the 1,100 separate trade unions, there are 24 owning more than £50,000, which together possess three-eighths of the aggregate total of members and four-fifths of the accumulated funds of the whole movement.

The fundamental principle of English trade unionism is the necessity, in modern industrial and social conditions, for the establishment and enforcement of a common rule, with regard to the conditions of employment. Without the enforcement of such a common rule trade unionists assert that the operation of competition is inevitably to degrade the conditions of employment irrespective of the profitability of the industry or the wealth of the country as a whole; eventually forcing down the remuneration of the lowest and weakest wage-earner to the very minimum on which he can manage to exist from day to day (far below the level for healthy subsistence); requiring him to labor for excessive hours, and exposing him to unsanitary, dangerous and brutalizing conditions of employment. Toward such a morass of "sweating," demoralizing to the workers themselves, and economically as well as socially disastrous to the community as a whole, the unrestricted competition of the labor market is always forcing out not only the weaker members, but also through the competition of these, the entire wage-earning class. In confirmation of this analysis, the English Trade Unionists point to the state of millions of workers in every industrial country, the United States and Japan affording quite as striking demonstrations as England and the continent of Europe. Its essential accuracy is, indeed, now asserted by the economists of to-day, and mathematically

demonstrated (consult 'Industrial Democracy' by S. and B. Webb, 1911); and accepted in such measures of modern statesmanship as the Trade Boards Act (1907), and the minimum wage legislation of Australasia and the United States.

Against this persistent tendency of industrial competition in the labor market, the modern economist or statesman establishes, in the interest of the community as a whole, the Common Rule of standard minimum conditions, designed to prevent the wage-earner being subjected, even with his own consent, to conditions of employment likely to impair his health, undermine his strength, or demoralize himself or his family. This is the philosophy of Factory Legislation, as yet only imperfectly applied in any country, but advancing in all; as yet restricted in the main to women and children, and to their hours and sanitation, but now increasingly extending to wages and other conditions, and to adult men. The maintaining, extending and enforcing of Factory Legislation is one of the principal expedients used by English Trade Unionists (especially the textile operatives, the coal miners, the railway workers and the shop assistants) for obtaining the protection of the Common Rule. Such legislation has been carried to its fullest extent at present in New Zealand and Australia. (Consult 'State Experiments in Australia and New Zealand' by W. P. Reeves).

The second expedient used by English Trade Unionists is that of Collective Bargaining. Instead of each wage-earner making his own bargain with the individual employer, the Trade Union aims at making common terms for the operatives as a whole, with the whole of the employers. Examples of such Collective Bargains are the "Working Rules" which govern the building trades in nearly every English city; the elaborate hierarchy of agreements of the iron-shipbuilding trade; or the highly evolved lists of prices of the cotton industry. This does not mean (as often ignorantly asserted) that Trade Unionism implies, or that Trade Unionists desire, that all workers should be paid alike. The mere fact that a large majority of the English Trade Unionists (including the strongest and ablest of them all) absolutely insist on piecework as the very basis of their Collective Bargains, and would instantly strike against any attempt to introduce wages by the hour or by the day, proves that equality of earnings is not their object. What they do aim at is equality in the rate of pay for a given unit of work; though even here their aim is only to secure for every worker as a minimum the standard rate for the work done. No objection is made to more than the minimum rate being given, provided that this is not done in such a way as to bring other workers below the minimum. Collective Bargaining, more or less universal throughout the trade, is now the prevalent practice in all the principal manufacturing industries of Great Britain and it is, to the economist, a notable fact that it prevails most universally and is most strictly enforced, just in those industries, such as cotton spinning and shipbuilding, in which British industrial supremacy is most demonstrable.

The third expedient of English Trade Unionism is Mutual Insurance. By bringing to the support of the individual workman, in any

time of economical weakness, the aid of accumulated funds, he is enabled to stand out against the terms offered by the employer, and wait until better terms are conceded. It is with this object, and not primarily from any compassionate or humanitarian feeling, that English Trade Unionists have so generally united the well-known "friendly benefits" with their trade combination. The large accumulated funds of some of the English Trade Unions, amounting sometimes to £25 per head of membership, afford valuable assistance in their Collective Bargaining for better conditions, by making possible the final arbitrament of the strike. But they do more than that. In small and closely unit trades, where the operatives are sufficiently self-restrained and intelligent, what we have called the strike in detail may be an effective weapon. There may even be no overt Trade Unionism. The employer may refuse to recognize the Union, or the law may make corporate action dangerous. There may be no attempt to prevent the employer filling his vacancies. But if the men in the trade are strongly combined, the employer may find that he cannot keep any man more than a week or two. Each man in succession leaves in silence before he has well settled down to his work, leaving the employer to find out for himself in what way the conditions which he is offering offend against the undivulged Common Rule. Such a strike in detail is out of the power of any but a small, skilled, strongly combined, highly intelligent, and rich Trade Union having an elaborate Mutual Insurance. But with such a Union experience shows it to have often been more efficacious in maintaining the Common Rule, than the most turbulent of mass strikes.

During the 20th century the Trade Union Movement has more and more consciously striven to assert the right of the workers collectively, not merely to maintain and defend their standard of life, but also to exercise control of the industry in which they live (consult 'The World of Labour,' by G. D. H. Cole, and 'National Guide,' edited by J. Orage); at any rate in so far as concerns the conditions under which they spend their working lives.

The English Trade Unions form, with the analogous associations into which the employers in the principal trades are now brigaded, elaborate organizations—based, in the best cases, on mutual discussions in joint committees, investigation by neutral accountants and the joint application of principles by the salaried officers of the employers and of the workmen respectively—for Collective Bargaining, the settlement of standard piecework lists, scales of wages, and other general minima of the conditions of employment to be observed throughout the trade; for the application of these formal agreements to the varying circumstances of particular districts, particular establishments, particular branches of work, and even particular jobs; and also for the revision of these general agreements and the settlement by arbitration of the disputes that from time to time inevitably arise. Within each establishment there is often a Workshop Committee or a number of "shop stewards," elected by all the men employed, negotiating with the management. This elaborate machin-

ery for determining, irrespective of the will or caprice of individual employers or individual operatives, the minimum conditions on which the whole trade shall work, is most highly organized in the cotton spinning and manufacturing, coal mining and shipbuilding industries, together with some smaller trades, such as the brassworkers, lacemakers, and compositors.

The Trade Unions have, however, further organizations of their own. The local branches in each town are united for mutual support in Trade Councils, of which there are now over 330. These organizations are of little financial strength, and chiefly of moral support. More substantial are the great federations, of which the principal one, the General Federation of Trade Unions, now includes over 140 Trade Unions with 900,000 members, and large accumulated funds. This has for its object the mutual support of its constituent unions in industrial disputes. Another federal body, the Federation of Engineering and Shipbuilding Trades with 600,000 members (including most of those in the General Federation), has for its principal object, the prevention and settlement of the disastrous disputes that occasionally break out between one set of workmen and another as to the "encroachments" by one trade on another, and the proper "demarcation" of their several pieces of work. A third body, the Miners' Federation, is composed of practically all the coal mining Trade Unions, and has, beyond mutual support, principally for its object the obtaining of additional Mines Regulation Acts, especially the maintenance of the eight-hour law (secured in 1908) and the enforcement of the Coal Mines (minimum wage) Act (secured in 1912). But the Miners' Federation (like some other so-called federations) is more and more becoming a strongly centralized Trade Union, so far as policy and political action is concerned, the federal form being retained chiefly as a means of securing efficient local organization.

The relative proportion which Trade Unionship members in the United Kingdom bears to the wage-earners as a whole, is often much misunderstood. The four millions of Trade Unionists amount to only one in four of the whole. What is, however, obscured by the statement is that the vast mass of the wage-earners belong to occupations in which Trade Unionism does not exist, or exists only in rudimentary form — such, for instance, as the agricultural laborers, the unskilled laborers in urban districts and the domestic servants, or the large numbers who work in one or other form as independent producers, such as the jobbing craftsmen, the tin and copper mines, the home-working seamstresses, etc. Women workers, generally, including all the factory population, count only 400,000 Trade Unionists out of some six millions of women industrially employed. A more correct way to estimate the strength of Trade Unionism is to take the proportion of Trade Union membership to the adult males employed at wages in particular industries. In many cases, such as the boilermakers, the cotton spinners, the lacemakers and the coal miners, it would be found that over whole districts of England every operative actually employed was a Trade Unionist. In such industries, indeed, Trade Unionism is as universally

compulsory as citizenship, and is enforced by as little conscious pressure. It is taken for granted by every workman, as it is by every employer. The whole industrial organization is adjusted to it, with the result that it becomes as imperceptible as the weight of the atmosphere. On the other hand, there are great industries, such as the building and engineering trades, in which, while strong Trade Unions exist, are whole districts in which a majority of the workmen remain outside the unions, not caring to pay the weekly dues; and usually in every town some establishments which employ indifferently both Unionists and non-Unionists. To the economist it is significant that it is precisely in those industries in which Trade Unionism is virtually universal and compulsory — among them being particularly cotton spinning and shipbuilding — that both technical processes and the use of machinery have been most advanced, and both industrial efficiency and financial success have been most conspicuous. In contrast stand the "sweated" industries, low grade in quality in their nature, and curiously unstable in their position in the world-market. In these industries neither Trade Unionism nor effective Factory Legislation exists.

The most marked characteristic of British Trade Unionism during the decade 1905-15 was its increasing attention to Parliamentary action, and the creation of an effective Labor Party. Political action had, for a whole century, been one of the weapons of Trade Unionism, notably among the cotton operatives and coal miners; and Trade Unions have openly spent money on electioneering, and have maintained their own members in Parliament since 1874, at any rate. An "Independent Labor Party" was formed in 1893; the Trades Union Congress took action to reform such a party on a broader basis in 1899; but it was not until the Taff Vale case (a legal decision which made Trade Unions henceforth liable in damages for any action of their officers, as if they were corporate bodies, although they were not allowed the privileges of corporate bodies) that the matter was energetically taken up. At the general election of 1906 no fewer than 50 candidates were run by the Labor Party, and 29 of them were successful. Since that date there has been continuously in the House of Commons a separately organized party, in 1916 numbering 40 members, representing "The Labor Party," which is itself a federation of trade unions, trades councils, Socialist societies and co-operative societies, counting altogether over two million members. The Labor Party in Parliament has obtained the enactment of the Trade Union Acts, 1906 and 1912, which restored the Trade Union immunity from litigation affecting their corporate funds and the Trade Union right to subsidize political action, both of them impaired by judicial decisions (the Taff Vale Railway and Osborne cases). The influence of the Parliamentary Labor Party has been seen also in the quickening of radical policy in social and economic questions, resulting in the provision of old age pensions, meals for necessitous children at school, a legal minimum wage for sweated trades, the eight hours day and a legal minimum wage for coal miners, a more effective "fair wages clause" in all government contracts, labor exchanges to diminish unemployment, more drastic progressive taxation

of incomes, and the National Insurance Act, covering sickness, maternity, accidents, unemployment and permanent disability. Soon after the outbreak of war in August 1914, when the Liberal and Conservative parties united to form a Coalition Ministry, the Labor Party was invited to join as a separate entity, and its leader, Mr. Arthur Henderson, became a member of the cabinet.

**Bibliography.**—The principal authorities are the 'Annual Reports' of the Board of Trade (Labor Department) on Trade Union Statistics, Collective Agreements, Rates of Wages, and on Strikes and Lockouts, together with the Annual Reports of the Chief Registrar of Friendly Societies (those relate only to registered Trade Unions). For the history, consult 'The History of Trade Unionism' by S. and B. Webb (1911 edition), and (as to origins) also 'Industrial Organization in the 16th and 17th Centuries,' by George Unwin (1904). For an elaborate economic analysis of every form of Trade Union activity, consult 'Industrial Democracy,' by S. and B. Webb (edition of 1911); also 'Methods of Industrial Remuneration,' by D. L. Schloss; 'Industrial Peace,' by L. L. F. R. Price; 'The Case for the Factory Acts,' edited by Mrs. Sidney Webb, with preface by Mrs. Humphrey Ward. The latest works of importance are 'The World of Labour,' by G. D. H. Cole (1915); and 'Trade Unionism,' by C. M. Lloyd (1915); consult also the elaborate details in 'The Labour Year Book' (1916). For the case against Trade Unionism, from the standpoint of the individualist employer, consult 'Trade Unions and Industry,' by E. A. Pratt.

SIDNEY AND BEATRICE WEBB,  
Joint authors of 'The History of Trade Unionism'; 'Industrial Democracy'; 'Problems of Modern Industry.'

**34. THE LABOR MOVEMENT IN POLITICS.** The greatest politician of the last century, W. E. Gladstone, writing in 1892, expressed the opinion that "The labor question may be said to have come into public view simultaneously with the repeal of the Combination Laws,"—that is about 1825.

Accepting this authority, we may divide the 90 years that have since elapsed into three periods, dominated not as might be expected by three but by two ideas. From 1825 to about 1850 labor, when it fought at all, fought under its own flag, and disdained alliance with any other party. From 1850 to 1900, partly owing to the dominating personality of Mr. Gladstone, political labor for the most part joined hands with Liberalism. In 1900 the banner of independence was raised once more, and has already attracted the greater part of the political forces of the proletariat.

**The First Period of Revolt.**—Up to 1832 the Government of England was an irregular oligarchy rather than a democracy. The House of Commons, which then as now exercised supreme control, was elected in a haphazard fashion. A few members represented large democratic constituencies; many were elected by some scores or hundreds of voters; many others were practically nominees of individual landowners or of the Crown. Labor scarcely aspired to political rights; all it asked was relief from coercive legislation and excessive taxation.

The populace, of course, supported the reformers of 1832-32, and it was fear of revolution which forced the House of Lords to consent to the passage of the Reform Bill.

Nearly the first work of the reformed Parliament of 1832 was the amendment of the old Poor Law, which had reduced the agricultural laborers of southern England almost to the condition of serfs, owned not by individuals, but by their parishes. The abolition in 1834 of the system of indiscriminate outrelief was intensely unpopular, and this, combined with the memories of the recent reform agitation, and with the teachings of Robert Owen (q.v.), who had promulgated many of the doctrines of modern Socialism, led to the Chartist movement, the first distinctively working class political agitation in modern England. See CHARTISM.

"The People's Charter," drafted by Francis Place, the radical tailor, was issued in 1838. Its six points were universal (i.e., manhood), suffrage, election by ballot, payment of members, annual parliaments, equal electoral districts and the abolition of property qualification for members. This purely political program gathered to itself the whole of the working class discontent which hitherto had taken other forms. In 1839 the north of England was saved from a revolutionary rising by the ability of Sir Charles Napier; and Chartism was crushed by the imprisonment of its leaders. It survived till 1848, when the continental revolutions fanned it again into flame, but it expired after the failure of a monster meeting at Kensington, London, which was to inaugurate the British revolution. Meanwhile the agitation for the abolition of the Corn Laws, which was successful in 1846, had attracted to the Liberal party a great measure of labor support, and with the disappearance of Chartism, the first period of revolt terminated.

**Labor in Alliance with Liberalism.**—The abolition of the Corn Laws was followed by a series of years of expanding trade and growing wealth; the narrow Whig oligarchy was gradually replaced by a broader Liberalism which conferred the suffrage on the workmen of the towns in 1867, and on those of the rural districts in 1884. John Bright (q.v.), the tribune of the people, and Joseph Chamberlain (q.v.), the idol of radical Birmingham, were the real leaders of the working classes up to 1886, and Gladstone generally held their allegiance from 1868 till his retirement in 1894. The trade unions had during this period established themselves as national institutions, and the standing Parliamentary committee of their annual conference was in constant friendly communication with Sir William Harcourt (q.v.), Sir Henry James (now Lord James) (q.v.), A. J. Mundella and other leading Liberals. George Odger was one of the first working-class aspirants to Parliament, but he died before the day of victory. In 1874, Thomas Burt (q.v.), the Northumberland miner, was elected for Morpeth, a position he still retains in 1916, and his remarkable career has been honored in his old age by the high dignity of a seat in the Privy Council. In the same election another Labor candidate, Alexander Macdonald, was successful. At first the Liberals opposed these upstarts; but their claims were soon admitted, while their harmless

respectability and valuable special knowledge were generally acknowledged. Eleven Trade Unionists were elected in 1885; in 1886, 9; in 1892, 15; in 1895, 12; 3 more were successful at bye-elections between this date and 1900; there were 52 in 1906, and only 39 in 1916. Meanwhile Henry Broadhurst, a stone-mason, was appointed Parliamentary Under-Secretary of State for Home Affairs in 1886, and Thomas Burt, the miner, was Parliamentary Secretary to the Board of Trade from 1892 to 1895.

It may be said that almost all these men were elected as Liberals. The distinction between them and the others of their party was that they had been manual workers, they had entered Parliament as nominees of their fellow workmen, and usually their election expenses were paid and their maintenance was provided by the funds of their trade unions. But in fact the classification, though definite, is not determined by any one factor. Working men were elected during this period in considerable numbers to town councils, school boards, county councils and other local governing authorities, and many were appointed justices of the peace, that is members of the unpaid courts of first instance.

**The New Revolt.**—The origin of the revival of independence in politics dates from 1884, when the modern Socialist movement began in England. In this year the Social Democratic Federation, founded a short time before by H. M. Hyndman, became distinctively socialist, and the adhesion to its ranks of William Morris (q.v.), the poet and artist, brought it into immediate prominence. Several Socialist candidates were put in the field at the election of 1885, but they all failed to secure more than a few dozen votes, except John Burns, (q.v.), who polled 598 votes at Nottingham, but, of course, was defeated.

From this time onwards the Socialist party made slow but steady progress. The Fabian Society, founded also in 1884, devoted itself to adapting the principles of socialism to English political conditions, and in 1893 the late J. Keir Hardie (q.v.) (Ayrshire Miners), who had been elected to Parliament for West Ham, near London, the year before, founded the Independent Labor Party, a socialist body whose object was to promulgate a form of socialism more acceptable to British trade unionists than the doctrinaire and revolutionary gospel according to Marx, which was then expounded by the Social Democrats.

Here we must turn aside to make one point clear. The Independent Labor Party (commonly called the I. L. P.) is a small, though influential, socialistic body, which has some 60,000 members. It must be carefully distinguished from the Labor Party which is before all things independent, as well as from the Labor Party in its wider sense. This important distinction is constantly neglected even in the best-informed London press.

During the 15 years prior to 1899 the Socialist societies kept up a constant agitation for the direct and independent representation of labor in Parliament, with a certain measure of success. John Burns was elected in 1892 for Battersea as an independent attached to no party. Keir Hardie, after his election, carried his independence even further, but lost his seat in 1895, and was not re-elected till 1900. But

only one member ever got in on a purely Socialist ticket for a few months in 1910—Victor Grayson. Meanwhile the trade unions had been gradually permeated with the new spirit, and in the autumn of 1899 at their Plymouth conference, a resolution was carried instructing their executive to call a conference of trade unions and Socialist societies in order to form a new body for the promotion of labor representation. This conference met in London in February 1900, and the Labor Representation Committee was then founded with a membership (at the close of the first year) of 376,000, of whom less than 23,000 were Socialists and the rest trade unionists.

The new body (which in 1906 altered its name to the Labor Party) consisted of a federation of trade unions, trades councils (that is the local organization of trade unionists in each town), and the three Socialist societies, of which, as previously mentioned, the Independent Labor Party is one. The Social Democrats, however, withdrew a year or two later. At the general election of 1900, the Labor Representation Committee, as it was then called, put 15 candidates into the field, but it was only a few months old; the Conservative Party, asking a vote of confidence from the country while the South African War was in progress, won an overwhelming victory, and the Labor Party was not ill-pleased to score two wins, Keir Hardie at Merthyr and Richard Bell (a railway man) at Derby. During the next five years it won three sensational bye-elections, but Mr. Bell dropped out, and at the dissolution the new party numbered four. Mr. Bell's defection was due to a change in the policy of the body. It was first formed to create a "group"; it was determined that candidates supported by the Labor Representation Committee might ally themselves on other questions with the existing parties; that independence should be limited to labor questions alone. Against this policy a constant internal struggle went on till the Newcastle conference of February 1903, when the extremists won an overwhelming victory, and thenceforward the watchword was complete independence of all other political parties.

There are two chief reasons for this policy. One, of course, is distrust of the Liberal Party which is largely middle-class, controlled by wealth, and in league with a section of the aristocracy. It is not necessary to discuss how far this distrust is well founded, because it is undeniable that the Liberal Party, as at present constituted, must consider other interests as well as those of the workers. The other reason is more cogent. If labor makes any political alliance it must be with the Liberals. Once indeed the secretary of the cotton-operatives was a Tory candidate for Oldham, but he lost the seat for his party, and he is the only exception to the otherwise unbroken rule that labor alliance means alliance with Liberalism. But very many trade unionists, especially in Lancashire, are Conservative, or at any rate are strongly anti-Liberal. In fact it was the accession of 103,000 textile operatives that at the Newcastle conference turned the scale decisively for independence. Five years were spent in active preparation, and the long-expected election of 1906 found the Labor Party ready for the fight.

**Political Labor in 1916.**—Having traced

the history of the participation of Labor in politics, we shall conclude with a survey of its present position, which will reveal an extraordinary complexity of organization, and a considerable diversity of ideas.

The most dramatic result of the Liberal victory in 1906 was the appointment of John Burns, engineer, socialist, and trade unionist, to a seat in the Cabinet as president of the Local Government Board, which carries with it membership of the Privy Council.

The representatives of labor in that Parliament belonged to three distinct groups: (1) The Labor Party proper, the group of 30 men who sat in opposition to the government, and in complete isolation; (2) the Miners, of whom there were 13 (besides one or two in the Labor Party), some of whom were elected as Liberals, some as miners simply, who in a few cases fought and beat the official Liberal; (3) the Liberal-Labor men who numbered 11 at the election, but who had since been reduced to 10 by the retirement of Mr. Broadhurst. The Miners and the Liberal-Labor men formed a group within the Liberal Party, and a number of advanced radicals usually co-operated with them. Between 1908 and 1910 they all united with the Labor Party. See **POLITICAL PARTIES.**

The body holds an annual conference which has exclusive power to alter rules and determine policy. This conference elects the executive committee. Since 1914 the Labor Party has been politically the central Socialist body for Great Britain. Its strength is about 1,500,000. The official organ of the party, *The Daily Citizen*, died of lack of support in 1915.

The political aims of labor are very indefinite. The party itself includes men of divergent opinions, though to a less extent than the others. About three-quarters of its members are Socialists. The remaining quarter declines so to label itself, but it has no definite creed, and constant association with men of strong opinions, who as a rule have studied political and social problems, makes it to say the least, extremely tolerant of Socialism.

The party was long in favor of Old Age Pensions, and of the nationalization of railways and of land. It has advocated state provision of work for the unemployed and of meals for underfed school children; and it strongly supports free trade, a policy on which all sections of labor are united. The attitude of the Labor Party to the Liberal Government again is conditioned by various factors. The party exists by independence, but none the less it was elected largely by Liberal votes.

The Socialist political policy includes the labor policy above indicated, and goes farther on the same lines. It advocates the municipalization of the liquor trade, and more drastic interference with the evil results of competition, such as long hours and overtime, child labor and sweating of women's labor; it favors compulsory arbitration to replace strikes and lock-outs; and a more vigorous extension of the sphere of municipal and governmental industry. Some Labor men oppose some of these proposals. Very few would oppose them all.

At present the prospects of the Labor Party are bright. Its leaders are united and harmonious. Moreover, the party has made a name for itself; it is a force to be reckoned with; its action is watched, and its intentions dis-

cussed in advance. In every respect the Labor Party member has a marked advantage over his Liberal-Labor rival. On 29 Dec. 1918 complete returns from the elections for the new House of Commons gave the following results:

Coalition.	
Coalition Unionists.....	334
Coalition Liberals.....	127
Coalition Labor.....	10
Total coalitionists.....	471
Other Parties.	
Unionists.....	46
Asquith Liberals.....	37
Labor.....	65
National Party.....	2
Socialist.....	1
Irish Nationalists.....	7
Sinn Féiners.....	73
Independents.....	5
Total of other parties.....	236
Coalition majority.....	235
Coalition majority with 46 Unionists.....	327
Grand Total.....	707

Prophecy in politics is peculiarly risky, but it is fairly safe to say that the share of labor in the control of the destinies of the empire will be larger in the future than it has been in the past.

#### **Bibliography.—First and Second Periods.—**

The following amongst many may be consulted: Gammage, 'Chartist Movement' (1894); Wallas, 'Life of Francis Place' (1898); Podmore, 'Life of Robert Owen' (1906); Broadhurst, 'Autobiography'; Howell, 'Labor Leaders, Labor Legislation, and Labor Movements'; and also for both periods books on trade unionism and co-operation.

**Third Period.**—Webb, 'Socialism in England' (Sonnenschein 1893); Noel, 'The Labor Party: What it is and What it Wants' (Unwin 1906); Annual Reports of the Labor Party (London); Annual Reports of the Trade Union Congress (London); Annual Reports of the Independent Labor Party (London); Publications of the Social Democratic Federation (London); Annual Reports of the Fabian Society (London).

—Honorable Secretary since 1914; Trustee  
and Member of the Executive of the Labor  
Party.*

#### **35. THE CO-OPERATIVE MOVEMENT IN GREAT BRITAIN.**

The earliest examples of co-operative institutions are the corn mills and baking societies started in the closing years of the 18th century and the first decade of the 19th as a relief from the millers' monopoly and the exorbitant price of flour. At Hull, Whitby, Sheerness, Devonport, and sundry places in Scotland, mills and bakeries were worked successfully on a ready-money, cost-price basis, but they had little effect on the subsequent movement, though Sheerness and a few other societies still exist. The co-operative idea, as we know it, was evoked in the mind of Robert Owen by consideration of the antagonism of classes produced by the industrial revolution with its wide-spread misery among the factory operatives. Failing to persuade his fellow manufacturers to follow his example of humane treatment of his employees, and failing

to obtain efficient factory legislation from the government, he devised the plan of organizing the workers into self-sufficient communities, owning and cultivating the land in common and producing commodities for their own use or for exchange with other communities. Two such colonies, at Orbiston in Lanarkshire (1826) and at Ralahine in Ireland (1830-34), nearly succeeded. His followers, who enthusiastically adopted his communist doctrines, started, from 1828 onwards, numerous associations for co-operative trading, which employed their profits in setting their members to work at manufacture on a small scale. To provide a market for the goods so made, Owen in 1832 opened his Equitable Labor Exchange at Gray's Inn in London, where persons leaving goods for sale received in exchange labor-notes based on the average time of production at six-pence per hour. In 1830 there were nearly 300 "Union Shops" with over 20,000 members, and between 1830 and 1835 seven Co-operative Congresses were held. But by 1835 the whole movement collapsed owing to want of legal status, the divergent interests of the members, and the failure of the labor-time principle. The enthusiasm of Owen's followers now overflowed into the Chartist movement.

The second stage in the history of co-operation began in 1844 with the founding of the Rochdale Society of Equitable Pioneers by a group of Socialists, Chartists and Trade Unionists, who found the motive in the failure of a strike among the flannel weavers. Its objects were the sale of provisions, etc., the building and buying of houses for members, the employment of out-of-work members in manufacture, the purchase of an estate to be cultivated by members out of work or underpaid, "to establish a self-supporting home colony of united interests," and to start a temperance hotel. Cash payment and good quality were principles shared with the older movement, but the new departure on which the success of co-operation was to turn was the surrender of the attempt to sell at cost price. In lieu thereof Charles Howarth introduced the system of dividing profits upon purchases, and from that moment co-operation has never ceased to prosper. This system took the government of the society out of the hands of founders or shareholders and transferred it to the customers, that is to the general co-operative community. The rules for the organization of a Co-operative Society have remained substantially the same as those of the original Rochdale Society. To quote one example: "The object of this society is to carry on the trade of dealers in food, fuel, clothes, and other necessities, and manufacturers of the same; the trade of general dealers (wholesale and retail); including dealings of any description with land, and the trade of builders." Membership is free to all, and each member must hold a fixed minimum of one-pound shares, one to five, carrying interest at 4 or 5 per cent. The maximum investment is £200, and each member has one vote only, whatever his holding of shares. The quarterly general meeting of the society is the governing body, but the management is in the hands of the committee, generally elected for a year, half retiring each six months. The secretary is elected for a year by the general meeting, but is the servant of

the committee, which appoints all the other officials and workpeople. The shares can be withdrawn but are not transferable and therefore have never more than their face value. The business of the store is transacted in the same way and at the same prices as ordinary shopkeepers, and after interest has been paid the profits are divided among the customer-members in proportion to their purchases. Metal tokens or paper checks registering the value of each purchase are given to the buyer, and are collected periodically and credited to him. Non-members are allowed half dividend. Out of the profits a bonus is sometimes paid to labor and grants made for educational and charitable purposes.

The co-operative movement now grew with exceeding rapidity. In 1862 the total sales of all the societies of all kinds in the United Kingdom amounted to £2,333,523; in 1870 to £8,201,685; in 1880 to £23,248,314; in 1890 to £43,731,669; in 1900 to £81,020,428. In 1914 there were 1,524 retail societies with 3,096,314 members, a total capital of £64,803,071; total sales of £164,587,520, and profits of £15,140,960. The obvious advantages of buying in large quantities led to the formation of the North of England Co-operative Wholesale Society in 1864 which in 1874 amalgamated with a similar metropolitan body to form the Co-operative Wholesale Society of England, with headquarters at Manchester. Only societies can be members and each member-society must take up one five-pound share for each 10 of its members, such shares being transferable at par. The general committee of 16 sitting at Manchester governs the society with the assistance of two branch committees of eight each at Newcastle and London. The final authority resides in the quarterly meeting, which, for sake of convenience, is held in three parts at Manchester, Newcastle and London, each member-society being entitled to one delegate for each 500 members. Questions are settled by the total votes at the three meetings. Goods are sold at slightly over cost price and the profit divided among the purchasing societies in proportion to their purchases. The Scottish Co-operative Wholesale Society, established in 1869, is similarly managed, but the member-societies have one vote in virtue of their membership, one vote for the first £1,000 of purchases, and one vote for each additional £2,000. A bonus is paid to employees at the rate of twice the purchasers' dividend. The two Wholesale Societies do not compete but act as each other's agents. There are sale depots at Leeds, Nottingham, Blackburn, Huddersfield, Birmingham, Leith, Kilmarnock and Dundee, and buying agencies in Ireland, Denmark, Germany, Spain, United States, Canada, etc.

Besides buying and selling at wholesale, the Wholesale Societies carry on a large amount of manufacture—boots and shoes, candles, woollens, clothing, furniture, brushes, upholstery, bedding, butter, flour, lard, jam, tobacco and printing by the English Society; flour, tweeds, blankets, tailoring, shirts, mantles, furniture, boots and shoes, hosiery, brushes, preserves, confectionery, tobacco, fish-curing and printing by the Scottish Society. The two societies own tea plantations in Ceylon, and the Scottish Society purchased a tract of land in Canada for wheat growing. The English Society conducts

a banking department for the distributive stores. The Co-operative Newspaper Society is another federal institution owned by co-operative societies. It publishes the *Co-operative News*, the weekly organ of the movement. The Co-operative Insurance Society is another "society of societies" doing mainly fire insurance of society buildings, £22,000,000 of property being so insured. The United Baking Society of Glasgow (capital £130,372), and eight corn mills (capital £347,071), are also productive societies, federations of ordinary stores. Production to the amount of several millions sterling is carried on by ordinary distributive societies, mainly in flour and baking, 19,456 persons being employed in production, and much activity is also shown by many societies in building houses to be sold or leased to members. The total investments of the stores in "house property" (including presumably their own buildings) is over seven millions sterling.

A large section of co-operators has always held that co-operation, which did not include a co-partnership with labor, was only a masquerade. To the Owenite communities succeeded the Redemptionist Societies "for carrying out the practice of associated labor," which had a brief life about 1850. The Christian Socialists—Kingsley, Maurice, Ludlow, Neale—in 1848-52 established some twelve "self-governing workshops" in which the employees were to supply capital, management and labor. Next in the early sixties came the "Oldham Coops," joint-stock cotton spinning companies in which the shares were mainly held by operatives, but they degenerated into ordinary companies. Efforts at founding manufacturing societies were persistent, and the wholesale and distributive societies and trade-unions lost large sums of money; 275 societies established before 1880 were extinct in 1882, leaving only eight corn-mills and 25 other societies. In 1884 the Labor Association was founded to promote productive societies on the basis of a co-partnership of labor and capital, the workers being entitled of right to a share of profit and being at liberty to invest their savings in shares. The mortality among societies continued high despite brisk propaganda—139 societies disappearing between 1880 and 1898. The Co-operative Production Federation was started to aid the societies with capital and prevent overlapping. A new branch of activity is the "Co-partnership Tenant's Movement" for building and owning houses, which has established since 1888 many co-operative colonies; there are now eight societies, of which four are active with £82,600 capital. In agriculture there were 906 registered societies with a capital of £1,031,397; they consist of farmers and small holders, buy seed and manures and sell produce for their members. On the whole they belong to a different class from the ordinary working-class societies. Finally, there is to be mentioned the Co-operative Union, started in 1869, which carries on propaganda through its district committees and the United Board formed of representatives of the sectional boards. It is also the parliamentary organ of the movement and devotes much labor to organization and education. Its headquarters are in Manchester. Under its auspices is held an annual congress of co-operative societies at which matters of interest to the movement are discussed, but the resolutions carried thereat

have no mandatory force. The Woman's Co-operative Guild, started in 1883, has nearly 600 branches and 31,500 members; it has done much education work among woman members of stores and has been specially active in organizing special stores in very poor districts. Its principal work is devoted to the housing question, anti-credit, divorce law reform and citizenship campaign. There is also a Woman's Co-operative Guild in Scotland, which has 174 branches and over 12,500 members. The International Co-operative Alliance for the promotion of co-operation throughout the world, is a federation of organizations in Great Britain, Germany, France, Italy, Austria, Hungary, Switzerland, Belgium, Denmark, Holland, Russia, Canada, India, the United States, etc. Congresses are held in different European cities every two or three years.

**36. BRITISH FACTORY LEGISLATION.** In the year 1784 there raged at Radcliffe, near Manchester, an epidemic fever in the cotton spinning works, where long hours of labor and a total absence of sanitation had undermined the strength of the juvenile operatives. The conditions of work in the Radcliffe mills were not worse than those prevailing throughout the neighboring industrial district, in which the new factories were multiplying fast. The epidemic of fever was but one among many similar epidemics. But when, at the request of the Lancashire justices of the peace, this particular outbreak was investigated by a committee of Manchester doctors, and when the leading physician among them, Dr. Thomas Percival, and the chairman of the Quarter Sessions, Thomas Butterworth Bayley, persuaded their fellow magistrates that the gravity and rapid diffusion of the sickness really arose from the "putrid effluvia" of the "numbers crowded together" in the new mills, and the "injury done to young persons through confinement and too long continued labor," they were close to the discovery of the great device of factory legislation. At once the Manchester justices, who were not at that date pecuniarily interested in cotton mills, decided henceforth to refuse to allow the "indentures of parish apprentices whereby they shall be bound to owners of cotton mills and other works in which children are obliged to work in the night, or more than 10 hours in the

day." In 1796 Dr. Percival and his friends definitely formulated certain resolutions, in which they again drew attention to the physical and moral evils of excessive hours of labor, of the unsanitary conditions of the factories and of night work; and in which they proposed, "if other methods appear not likely to effect the purpose," that Parliament should enact "a general system of laws for the wise, humane and equal government of all such works." Here we have expressly suggested the expediency of factory legislation. Within half a dozen years the first tiny instalment of that legislation—the "Health and Morals of Apprentices Act, 1802"—had, at the instance of the greatest mill owner of the time (Sir Robert Peel), passed into law. This experimental legislation of 1802, expanded by Robert Owen in 1815 into a general principle of industrial government, and applied in tentative instalments by successive generations of unwilling statesmen, has spread to every industrial community in the Old World and the New. Of all the 19th century inventions in social organization, factory legislation is the most widely diffused. The opening of the 20th century finds it prevailing over a larger area than the public library or the savings bank; it is, perhaps, more far-reaching if not more ubiquitous, than even the public elementary school or the policeman.

It is sometimes said that England has lost the lead in factory legislation; that New Zealand and several of the Australian states now outstrip her; and that in one respect or another France, Germany, Switzerland, and even Austria, surpass the United Kingdom in the protection of labor. This is not the place to examine into the accuracy of these assertions. It is by no means easy to ascertain, even from the laws of a country, exactly what national minimum it proposes to enforce, in all the varied circumstances of place and process, age and sex. Still less easy is it to discover to what extent the law is really obeyed and enforced. Though the policy of a national minimum is, in the United Kingdom, as yet inadequately embodied in law, and still imperfectly enforced, yet it may well be that the scope of the factory legislation is, taken as a whole, and as applied in actual practice, more extensive than that of any other state.

What is often overlooked is that the law on the subject is in the United Kingdom, not contained in any single code, or in any one act of Parliament, but has to be collected from among eight different branches of English law. There is first the law as to sanitation, which applies to factories as to other places, and is administered by the town council or other local governing body under the supervision and, more or less, the control of the Local Government Board. With this we may name the law as to education, with its incidental restrictions on the employment of children under 14, and as regards certain classes of young persons even up to 16, enforced by the town and county council under the supervision of the Board of Education. It is partly in connection with education, too, though partly also in connection with the prevention of cruelty to children, that the town and county councils are empowered to make by-laws, subject to the approval of the Home Office, regulating or pro-

hibiting the employment of children and young persons under 16 in certain occupations. The law regulating the conditions of employment as such is itself scattered over six distinct series of acts of Parliament, relating respectively to (a) factories and workshops generally, including all manufacturing industries, laundries, docks and works of engineering; administered partly by the Home Office itself and partly by the local governing bodies under the Local Government Board; (b) mines, administered wholly by the Home Office; (c) retail shops, administered wholly by the local government bodies, under the Local Government Board; (d) ships, and (e) railways, both administered wholly by the Board of Trade; and, finally, (f) the industries subjected to the Trade Boards Act (such as tailoring, boxmaking, chain and nail making, confectionery, etc.), in which a legal minimum wage is enforced by the Board of Trade.

The principle underlying this mass of complicated and detailed legislation—a principle which was not consciously present to the mind of its early advocates, and one which is still only grudgingly admitted—is the establishment and enforcement of a "national minimum" in the circumstances of employment, below which it is judged to be inexpedient, in the permanent interests of the community as a whole, that any person should be employed. "The ultimate end of factory legislation," approvingly wrote the *Times* of 12 June 1874, "is to *prescribe* conditions of existence below which population shall not decline." This compulsory national minimum is naturally a rising one. "Every society is judged, and survives," aptly said Mr. Asquith in 1901, "according to the material and moral minimum which it *prescribes* to its members."

It would be an interesting and supremely useful subject for graduate study to discover what is the national minimum which the various civilized states of the world now actually *prescribe*, by compulsory law, to the various grades and classes of citizens, in the different circumstances of their respective employments. To do this even for the United Kingdom would require much more than the space here available. The student would find that the system of regulation which began, in 1802, with the protection of the tiny class of pauper apprentices in textile mills, now includes within its scope every manual worker in every manufacturing industry. From sanitation and the duration of labor, the law has extended to the age of commencing work, protection against accidents, the fixing of meal times and holidays, the methods of remuneration, and now also, in coal mining as well as in various low-paid industries, the amount of the wages. The prescription of national minima is, however, still very far from being either uniform or systematic. The various requirements in the way of sanitation, duration of labor, hours of beginning and ending, age of commencement, meal times and holidays, remuneration and protection against accidents, often apply, each of them, to particular industries, particular processes, particular ages, particular localities and particular sexes; partly, of course, because the various detailed prescriptions are, in their very nature, applicable only to this limited extent; but, more commonly merely on account of the empirical, and so to speak, accidental character

of all our legislation. Speaking generally, we may say that the policy of the national minimum has been most completely and efficiently worked out in the industry to which it was first applied, mainly cotton spinning and cotton weaving; and in which—whether *post hoc* or *propter hoc*—England still leads the world; taking industries generally, it has been far more thoroughly applied to the employment of women and children than to that of men, in respect to whom it has only lately begun; with regard to subjects of prescription, it is most universal in respect of the cleanliness, ventilation, temperature and sanitary accommodations of the work place and the means of escape from fire; next most in respect of the age of commencement, the maximum working day and protection against accidents; whilst with regard to the enforcement of a national minimum of subsistence we are, in the United Kingdom, still in the stage of gradual application to trade after trade. The policy of a national minimum secures universal lip homage, so far as it applies to children. Yet our young children may lawfully be industrially employed, or even hired out for wages, in all Ireland outside the large cities, if in any industry not coming under the Factory Acts, at any age, at all hours, without stint; in Great Britain and the Irish cities (unless new by-laws have recently been made) in any such industry at any age, for any number of hours; under such by-laws, generally only after 11 years of age, and for limited hours, differing from place to place; in agriculture not under 12 and in factories or workshops not under 13, and then only half-time unless a minimum educational standard, prescribed by the local education authority, has been attained; generally speaking, full time after 14; but in some specified industries or processes not until 16, or even 18. The prescription of a minimum wage is still illogically confined to the relatively well-paid coalminers, on the one hand, because they were strong enough to compel Parliament in 1912 to pass the Coal Mines (Minimum Wage) Act; and on the other, to certain arbitrarily selected "sweated trades" brought under the Trade Boards Act because their operatives were too weak to stand alone. Still more wanting in universality and uniformity is the enforcement of such national minima as the law does prescribe. The distribution of the task of enforcing the law among over 2,000 independent local governing bodies, in England, Scotland and Ireland; the supervision and imperfect control exercised over these by four different government departments in England, besides several others for Scotland and Ireland; and the very different views which these government departments take of their duties—to say nothing of the very different degrees to which they have consciously adapted the root-idea of factory legislation as above set forth—necessarily makes the enforcement of the law extremely uneven. Only in two branches, indeed, that which deals with "factories" properly so called, in which women and children are employed in connection with mechanical power, and in coal mining can the law be said to be at all successfully and systematically enforced from one end of the kingdom to the other. These happen to be the branches of the law which are enforced by an official staff, appointed

by and solely responsible to, the Home Office in London.

For the enforcement of the policy of the national minimum, so far as this is committed to him, the Home Secretary has at his disposal, in the Factory Department of the Home Office, a "Chief Inspector," a score of specialist and superintending inspectors, and over 160 inspectors and assistant inspectors. This staff of about 170 men, who are paid from £150 to £1,000 a year, is supplemented by 21 lady inspectors, who receive from £200 to £550 a year. All the staff are appointed after examination, without regard to politics, and are permanently employed. These inspectors are perpetually traveling over the United Kingdom, covering among them nearly a million miles annually, and keeping under inspection more than a quarter of a million distinct factories, workshops, warehouses, laundries, docks and wharves (excluding those employing adult men only, which are ignored in practice), in which nearly five millions of persons are employed. Their efforts are aided by about 2,000 "certifying surgeons," who are paid by fees only. These are doctors in local practice who give the certificates of health without which, in certain cases, children cannot be employed. A similar, but more limited, staff is employed in the inspection of the mines and quarries. The tradition of the Home Office in this department is that it is the business of the inspector, not merely to act on complaints, or to make so many visits, but to get the law enforced. Hence, the inspectors go hither and thither as they think fit, visiting one factory frequently, another not at all; acting on any hint or suggestion that they can get of any illegality being committed and not only not refusing to act on anonymous communications, but eagerly welcoming them when nothing better is to be had. Unfortunately, however, the paucity of the staff allowed to it by the Treasury, and the curious reluctance of English government departments to see their functions expand, has led the Home Office to forego whole fields of industrial employment in which the enforcement of a national minimum is no less necessary than those which it inspects. It deliberately omits from its regular inspection not only the work places where men only are employed (though these are also subject to the law in various particulars)—as to this, see 'Life in a Railway Factory,' by Alfred Williams (1915)—but also the myriads of "domestic workshops," in which only members of the same family are employed, and in which the worst cases of "sweating" are found. The sanitation, too, of the workshops (not using mechanical power), even where women and children are employed, is, like the whole regulation of the homeworkers, abandoned, in the main, to the more perfunctory hands of the local authorities. On the other hand, it must be said that the Home Office far surpasses the Board of Trade in the execution of its duty of enforcing the policy of the national minimum. The scanty inspectorial staff of the Board of Trade, on whom we have to rely for the enforcement of the law relating to the conditions of employment in connection with railways and ships, confines itself practically to the investigation of cases actually brought to its notice by responsible specific complaints, or by accidents;

and takes up the attitude that it is not the business of the office, or of its parliamentary chief, to initiate anything. To the student of the factory system of the 19th century, the reflection will inevitably occur that, if the Home Office had acted on this principle, we should still have with us the "white slavery" of the Lancashire cotton mills, denounced by Oastler and Lord Ashley. The Board of Trade is more efficient in the administration of the Trade Boards Act, where the wage awards made by the joint boards of employers and employed in each trade are enforced by a small staff of inspectors who prosecute employers guilty of the offense of paying less than the prescribed minimum. But there is even a lower depth than the Board of Trade. The Local Government Board, the department to which Parliament has entrusted the enforcement of the national minimum of sanitation takes no action whatever to see that the local governing bodies put into operation the sanitary provisions of the Factory Acts with regard to workshops and the residences of home-workers; and fails even to compel negligent or recalcitrant local government bodies to put in force the Public Health Acts. It does not even make itself aware of the extent to which the national minimum of sanitation is being secured in the different localities.

Thus it is that, after a whole century of experiment in factory legislation—of experiment so demonstrably successful that it has converted the statesmen and the economists of the entire civilized world—the United Kingdom still contains districts, classes and industries in which there prevail the precise evils from which the cotton operatives of Lancashire and the coal miners of Northumberland suffered a century ago. The so-called "sweated" trades, to which factory legislation has not yet been effectively applied, remain as they were described by the select committee of the House of Lords in 1890, regions of "earnings barely sufficient to sustain existence; hours of labor such as to make the lives of the workers periods of almost ceaseless toil; sanitary conditions injurious to the health of the persons employed and dangerous to the public." What those who believe in factory legislation demand, and what the second century of such legislation may bring to us, is the conscious application of the policy of the national minimum to every branch of industrial employment; the explicit formulation of this policy in a systematic code, applicable, with only the necessary technical variations, to every trade in every part of the Kingdom, and to every worker in such trade, of whatever age or sex; the deliberate prescription, in the interest of the whole community, of the conditions of employment, whether sanitation or hours, education or subsistence, below which no individual can be permitted to be employed; and the vigilant enforcement of this minute universal code by the joint activities of the central departments and local governing authorities, each acting, through its highly organized inspectorate, as a check, not only upon all who break the law, but also upon any who should neglect their own part of its enforcement.

**Bibliography.**—The best vision of the administration of the Factory Acts in the United Kingdom is afforded by the 'Annual Report' of the Chief Inspector of Factories and Workshops, and the corresponding one of the Chief

Inspector of Mines. For the history and theory, consult 'Robert Owen,' by F. Podmore (1906); 'A History of Factory Legislation,' by B. L. Hutchins and Amy Harrison (1903) (with a good bibliography); 'Principles of Labor Legislation,' by J. R. Commons and J. B. Andrews (1915); 'The Prevention of Destitution,' by Sidney and Beatrice Webb (1911); 'Towards Social Democracy,' by Sidney Webb (1916); 'The Case for the Factory Acts,' edited by Mrs. Sidney Webb (1901); 'Socialism and National Minimum,' by the same (1909); 'Dangerous Trades,' edited by Dr. T. Oliver (1902), and 'Occupations,' by the same (1915); 'Foreign Labor Laws,' by W. F. ### 37. THE CHURCH OF ENGLAND.

It is difficult to define the characteristics of the Church of England so as to enable an outsider to understand it. In much that concerns its external form and traditions it is probably the most mediæval institution in Europe. In much that concerns its religious teaching and life it is more abreast of modern thought than any other religious body. The former characteristic may be illustrated by the fact that its property is held in some cases by direct gift of Anglo-Saxon kings, and that many of its institutions are feudal in their origin. Again it differs from any of the Protestant churches of the continent by the fact that it does not express as they do the teaching or influence of one individual reformer. In a very true sense its history has been continuous. It is an institution which has grown and developed with the history of the English people. It has been modified and changed to meet the needs of each age. It is an institution which has created a theology, not one which is the outcome of its theology. It is therefore clear that the Church of England can only be described by its history.

**History.**—The history of the Church of England dates from the mission of Augustine in 597 A.D. This mission was the direct action of the Church of Rome, but almost from the beginning there were other elements. A large part of England was as a matter of fact converted by missionaries from Scotland and Ireland, representatives of the old Celtic Church. Although the organization introduced by Augustine and Theodore ultimately prevailed through the whole island, yet the Church contained elements and traditions derived from Celtic sources. Gregory the Great had used

language in his letters to Augustine which implied that a considerable degree of independent development was to be left to the newly founded Church, and from the first its rites and ceremonies differed from the Roman. During the Anglo-Saxon period there were two elements in its history. The kings and the people of England were full of admiration for the Church of Rome to which they owed Christianity, but, on the other hand, the Church developed more and more as a national institution and its ecclesiastical laws were the work very largely of secular councils, on which the bishops sat. The Norman Conquest brought the British Isles very much into the swim of European life, and gradually two opposing currents of policy asserted themselves strongly. On the one side a series of able ecclesiastics aimed at securing the independence and privileges of the Church and at bringing it into close obedience to the central organization at Rome. On the other side the national development tended to assert the insularity and independence of the English state and sovereigns. There was a strong opposition to foreign ecclesiastics, to payments to foreign courts and to the influence of foreign monastic orders. Legislation such as the Act of Praemunire was introduced, limiting ecclesiastical authority and in the reign of Henry V the property of alien priories was confiscated. Throughout the Middle Ages there is literary evidence of criticism on much connected with the Church, which reached its head in the work of Wycliffe who combined opposition to the monastic body and the Church of Rome with a good deal which would be called in the present day Radicalism.

Like the Church of England the history of the Reformation (q.v.) is a complicated story. The final result was produced by various influences. There was the old national feeling as opposed to the claims of the papal curia expressed in the Reformation Acts by the statement that the realm of England was and always had been an Empire; there was the influence of the Humanism of Colet, More and Erasmus, which demanded a Conservative Reformation; there was the popular objection to the rights and privileges of the clergy; there was the strong conservative element which has always been characteristic of the English people and which checked any great tendency to change; and especially during the reign of Elizabeth there was the influence of the foreign reformers. The result was a Conservative Reformation. No attempt was made to sweep away the Old Church and reconstruct it, either doctrinally or as regards the constitution *de novo*. Such changes were made as were found necessary to express the different influences which prevailed. This might be shown in various ways and will appear as we proceed with our account. For example by a statute law which has never been repealed, the whole of the canon law which had been accepted in England before the Reformation is still the law of the Church, except in so far as it is contrary to Act of Parliament. By the time of Queen Elizabeth's reign the various parties had become clear. It was clearly the aim of the rulers of the time to unite as many elements as possible in one national church and the ultimate reform settlement was based therefore on

a policy of modeling a national church which should include very varied elements. The result of the Reformation was to modify and reform the existing institutions, not to create a new church in accordance with any system of doctrine. See GREAT BRITAIN — THE REFORMATION.

Since that time the Church of England has suffered hardly any change in its formularies or in its constitution; but it has been profoundly changed by the influence of various schools of thought, each of which has interpreted its formularies in accordance with their convictions. The close of the reign of Queen Elizabeth, the writings of Hooker, mark the beginning of a typical theology, and Anglicanism in the modern sense of the term was developed and worked out by the great divines of the 17th century. The result of the Commonwealth and of the Puritan domination was to strengthen the hold of the English Church on the nation, and at the time of the Restoration a vast majority of the people were attached to it. A very little more statesmanship on the part of the restored Cavaliers might have almost wiped out Puritan traditions. At the time of the Restoration the High Church party were the dominant factors in the Church, but the Roman tendencies of Charles II, the Roman Catholic position of James II, the fear of papal influence, and the Non-Jurors schism on the accession of William weakened its influence. Some of the ablest members of the High Church party left the Church at the time of the Non-Jurors' secession. High Churchmen were under suspicion as being opposed to the reigning dynasty, and in the first half of the 18th century the prevailing influence was the latitudinarian movement associated largely with the name of Tillotson. The Whig ascendancy, the suppression of convocations and the influence of the deistic literature reduced the spiritual life of the country to the lowest ebb. The movement for religious awakening grew up in the Church of England, but a secularized church was unable to contain the vigorous spiritual life of Wesleyanism. But though the Wesleyan Society passed outside the Church, its influence lived within it, and at the close of the 18th and the beginning of the 19th century, the evangelical movement was strong. All through this period the High Church party had lived on. The failure of the Stuart succession destroyed all suspicion of disloyalty, and eventually latitudinarianism and evangelicalism lost their hold on the country. High Church influences began to assert themselves again. The religious movement was assisted by a romantic reaction against the commonplace 18th century traditions and by the revival of an idealistic philosophy, and it came to a head in the well-known Oxford Movement, which is usually supposed to date from the year 1833. The Oxford Movement in its double aspect of High Church principles and of ritualism has profoundly changed the religious life of the whole Anglo-Saxon world. It was followed rapidly by a broad church reaction, and there has been a tendency of recent years for a new party to arise, combining many of the elements of both the schools. At the present time the theology of the Church of England is influenced by all the different movements we have described. The Church of England is not

"Anglicanism," but it has created Anglicanism within the fold of an Establishment. Various different types of thought prevail and the position can only be understood by looking at the Church as the result of the history we have described.

**General Principles.**—The Church claims to be that portion of the Universal Church of Christ located in England, a "true and apostolical church teaching the doctrine of the Apostles." It acknowledges that to the Crown "the chief government of all estates of this realm, whether they be ecclesiastical or civil, in all cases doth appertain." It is established, i.e., it is part of the constitution of the country. It is National; Protestant in so far as denying that the Bishop of Rome has jurisdiction in England and condemning the errors of the Roman Church; Catholic as claiming to be a portion of the Universal Church of Christ. It grounds itself on Scripture and the three creeds. Its ministers are bishops, priests and deacons. It claims to be continuous with the primitive church.

**Constitution and Law.**—The constitution of the Church was influenced by two main characteristics. One was a desire to do away with what we believe to be mediæval corruptions; the other to preserve the primitive organization of the Church. Naturally also there was a tendency to preserve all the distinctly national institutions which were inherited from the past. The orders of the Church of England are bishops, priests and deacons, and it is definitely laid down that the possession of episcopal ordination is necessary for holding office in the Church. The clergy of the Church meet in their own assemblies in Convocation which were originally the meetings of the clergy for taxing themselves at the time when they were immune from general taxation. At the present day, convocations have no legislative power except such as is intrusted to them on any special occasion by Parliament, and no change can be made in any law or custom of the Church without the consent of Parliament. But it was the theory, not perhaps always acted upon, of the Reformation and it has been the custom since, that Parliament should not legislate for the Church except with the advice of the clergy. Practically the result of this has been that external changes in either form or constitution of the Church have hardly been made since the Act of Uniformity of the year 1662. By the common law of the country the parson or parish priest has a freehold in his cure, and he can only be removed by very complicated legal processes. The result of this has been to make the English clergy very independent of any authority. The influence of the bishops as men may be very powerful and effective but if they wish to support their opinions or the administration of the law by any appeal to authority they are hampered at every turn by a complicated legal system which makes it exceedingly difficult for them, even in spite of recent changes, to interfere with acrimonious or refractory clerics. The difficulties have been increased by the unsatisfactory character of the Church Courts. It is a fundamental principle of the English law that the Sovereign is in all causes, as well ecclesiastical as civil, supreme. The Church has its own courts and those courts are very largely

secular in character and do not command the adherence of the clergy, while the Judicial Committee of Privy Council which is the final court of appeal in matters ecclesiastical, has not confined itself to reviewing judgments of courts on the point of view of justice to the individual, but has attempted to legislate by its judgments, and has not met with anything like universal acceptance. The position then is that the constitution of the Church and the Church Courts has grown up not in obedience to any particular theory, but by modifications from time to time of the traditional system and that it does not at present satisfy the convictions of a large section of the Church.

**Establishment.**—The position of the Church of England is that it is established by law and it is part of the constitution of the country. What exactly this implies has never been clearly defined and there are different sections of opinion on the subject in the country. The High Church party claim that the position of the Church is continuous with that before the Reformation and that the Church is by constitutional right free to determine its own teaching. A party which would be called by their opponents Erastian would claim that the Church was entirely subject to the Sovereign and to the Houses of Parliament. The former would point out that the Sovereign is rightly supreme in all actions relating to liberty of person and property, that (as shown by many Acts of Parliament, notably the Scottish Church Act of 1905), when questions of property are involved the Civil Courts or Parliament have to deal with the internal matters of the different religious bodies whether they call themselves "Free" or not, and that what the state has done is to accept to a large extent the Church Courts as part of its constitution. The Church of Ireland (Protestant Episcopal) was disestablished in 1869. An Act of Parliament was passed in 1914 disestablishing the Church of Wales and Monmouthshire, but the operation of the Act was postponed until after the termination of the war.

**The Property of the Church.**—The property of the Church consists of the following: (1) Tithes, which are charges upon the land paid originally to the parochial clergy. The origin of the institution of the tithes is much debated. It appears to have begun as a voluntary custom from charges made upon the land by the owners, and these customs and charges have gradually been recognized by law and become universal. Up to the time of the Tithe Commutation Act in 1836 all these payments were made in kind; by that Act they were commuted into money payments. (2) Landed Property. The Church has inherited a portion of the large estates which were in the possession of the bishops and other ecclesiastical bodies during the Middle Ages. These were ultimately derived in many cases from a grant by the sovereign or of individual land-owners. They include in addition to landed property, manorial rights and in the County Palatine of Durham royalty rights. In many cases they date from a period before the Conquest; for instance, Farnham Castle has been the property of the Bishops of Winchester from the time of a grant made in Anglo-Saxon times. In the great majority of cases now the landed property apart from the Glebe lands of the

parochial clergy is managed by the Ecclesiastical Commissioners and the bishops receive fixed stipends. (3) Modern Endowments. These largely consist of money, and are for the most part administered by the Ecclesiastical Commissioners.

**Prayer Book.**—The character of the Church of England is shown very clearly in the Book of Common Prayer. The Prefaces lay down that the object throughout was to preserve the old form of services but to fit them to the altered needs of the time, and in many cases to return to what were looked upon as more primitive customs. The first edition of the Prayer Book was issued in 1549, the second in 1552, the third in 1559, the fourth in 1604, and the fifth edition in 1662. The services throughout preserve the structure of the pre-Reformation books, but they are shortened and simplified; some of the finest of the collects were the work of Archbishop Cranmer himself.

**Doctrinal Formula.**—The doctrinal formula of the Church of England is the Thirty-nine Articles of 1571, and the belief of the Church is also to be gathered in the Homilies and Prayer Book. The production of religious formulae was the leading feature of all sections of the Christian Church during the Reformation period and amongst all the varied formulae the Articles of the Church of England are conspicuous for their shortness. At one time the subscription to these Articles was imposed by the State not only on all the clergy but all sections of the laity as the means of qualifying for office, but the tests for the laity have now been entirely done away with and that of the clergy is limited to a general assent to the teaching of the Articles. The courts have always been very broad in their interpretation of the doctrine of the Church of England. The clergy undertake to use the Prayer Book and no other document in public worship except in so far as allowed by lawful authority and give a general assent to the teaching of the Thirty-nine Articles. Within these limits the fullest freedom of opinion and expression of opinion is allowed.

**Anglican Theology.**—The theology of the Church of England has had certain special characteristics. (1) Owing to its connection with the universities there has always been a markedly learned character about a section of its clergy. *Clerus Anglicanus stupor mundi* was the verdict of the 17th century, and during that period a number of very learned works were produced by the Church. It suffered like all departments of the country by the intellectual lethargy of the universities in the 18th century. In the 19th century its character to a large extent revived. (2) But though a learned Church there have always been certain characteristics to distinguish it from other religious bodies. Its interest has been very largely in historical and exegetical studies. It has sedulously eschewed systematic theology. There is not at the present day an authoritative work stating the beliefs of the Church of England. It has been largely concerned with questions of ecclesiastical organization and the special features which have distinguished it from the Roman Catholic and Protestant churches. (3) The most prominent product of its activity has been the creation of that school of theology which might be defined as Anglican. Whereas

Luther and Calvin created Lutheranism and Calvinism the traditions of Anglicanism, on the contrary, are the product of the position of the Church of England rather than the creator of it. Although certain broad principles underlie the Reformation it would be impossible to say that any one prominent principle prevailed, but the result of a Conservative Reformation, with some reference to primitive truth, was to create a body which preserved historical tradition in the threefold order of bishops, priests and deacons, and the customs and rites of the primitive Church and at the same time had largely abolished mediæval corruption. The defence of this position created Anglicanism. A knowledge of the Eastern Church provided the exponents of that system with a very strong weapon and the Oxford Movement (q.v.) finally made this the dominant note in Anglican theology. But it must not be thought that it is necessary to hold "Anglican" views to be a member of the Church of England. Within the limits of the Church are many who would strongly object to those views. (4) The opportunities for a liberal position created on the one side by the relations of the Church with the universities and on the other side by the freedom of opinion secured by secular courts created a strong Broad Church movement. As the modern exposition of Anglicanism dates from the 'Tracts of the Times' so the modern exposition of the Broad Church theology dates from 'Essays and Reviews.' The aim of the Broad churchman has always been to keep himself in touch with modern science and modern criticism. But of recent years there has been a considerable rapprochement between these two schools and the appearance of 'Lux Mundi' marked a new departure by which the Anglican school accepted many of the results of modern criticism and thought which their predecessors had condemned. (5) Ever since the Wesleyan movement and the Evangelical movement which was its accompaniment in the Church of England, there has been a strong Evangelical party within the Church. Its tenets were represented by Simeon and the Cambridge school of the early 19th century and it took for many years a lead in philanthropic work and was especially connected with the abolition of the slave trade. But it has always failed as compared with the other two schools in an intellectual exposition of its system and has never in any great degree influenced the theology of the Church. Outside all these definite schools it is probable that there is a considerable element in the Church consisting of those who are by tradition loyal members of the Church of England, who accept its formularies without attempting to interpret them very definitely, whose interest in religion is practical rather than theoretical, and who are prepared to accept and work from the point of view of common sense rather than of elaborate theological accuracy the system in which they find themselves.

**Doctrinal Teaching.**—(1) The English Church has never accepted the position that the Bible and the Bible only is the authority for its belief. Its definite statement is that whatever is not contained therein or may be proved thereby is not necessary to salvation. But it has always recognized that in interpreting the Bible the traditions of the Church may be used. As regards the canon of Scripture it occupies a

middle position between the Protestant and Roman Catholic churches. It accepts the Apocrypha, though not as a standard of belief, or as authority for faith. (2) The acceptance of the two Creeds: The Nicene and the Apostles. This definitely means that its standard of belief is the traditional, orthodox teaching of the Church. It is, however, slow to express a decision, or impose its belief. (3) The acceptance of the two sacraments, of Baptism and the Lord's Supper, as generally necessary to salvation. As regards sacramental teaching it has always been very wide in its limits. It makes its standard the acceptance of the authorized service and it has frankly admitted that while Zwinglianism and the doctrine of transubstantiation are incompatible with its formularies, within these limits any form of eucharistic doctrine is allowed. As regards other rites and ceremonies it has always made a very definite distinction between the two sacraments and others, although its formulas have occasionally used the term sacrament in a wider signification. But it lays great stress on confirmation, orders and matrimony, and allows private absolution and confession, although it does not make them compulsory. (4) The acceptance of the threefold ministry of bishops, priests and deacons. Here again its demands point to a system rather than to a doctrine. All its clergy must be episcopally ordained, but it does not demand any definite theory of ordination apart from what is implied in acceptance of the ordinal. A section of the Church would make the acceptance of the doctrine of apostolic succession necessary, but it has never been the teaching of the Church officially and as a whole.

Negatively the Church condemns emphatically the system and authority of the Roman Catholic Church and the infallibility and supremacy of the Pope. It definitely condemns also certain doctrines of purgatory, the invocation of saints, the sacrifice of the mass, relics, the merits of the saints, and works of supererogation. In relation to the Eastern Church, while differing fundamentally in tone and temper, it is very nearly in doctrinal harmony, the chief points of distinction being of course the invocation of saints, the doctrine of the double procession, the use of the term transubstantiation, while there is some general hesitation about the acceptance of all the seven councils or the necessary acceptance of the seven sacraments. As against the Protestant churches as a whole, it would always avoid accepting the extreme forms of predestination or justification by faith; it would lay stress on the need of interpreting the Scriptures in accordance with the traditions of the Church; its would almost universally lay greater stress on the reality of the sacramental system, and it would maintain episcopacy as an institution against every other form of Church government whilst condemning the tendency to disunion which characterizes so many of the Protestant bodies. To some its mediating attitude appears to be a mere political compromise between two incompatible ideals, to its own members it would seem to be the one Church which most clearly holds the balance between the various conflicting aspects of Christianity.

**The Church and the Nation.**—The relation of the Church of England to the English

nation has been modified very considerably in the early part of the last century by a series of enactments. Almost all its exclusive privileges have been gradually taken away. It has no longer a paramount position in the universities, and membership of the Church of England is no longer necessary for any civil position in the state. Side by side with this there has been an enormous increase in the population, which has made the existing ecclesiastical arrangements quite unfit to cope with the immense mass of new work. Many of the dioceses are excessively large and the process of sub-division has not been rapid enough to keep up with the demands. In many districts the clergy and the Church have been quite inadequate to meet the spiritual demands of the people. This fact, combined with the increase in just those sections of the populace which were least touched by the influence of the Church of England, has led to a very great increase in Nonconformity. But this loss of privilege and greater need of work have not been detrimental on the whole to the Church. The various spiritual movements that we have narrated and the demands of the day have stirred up an immense amount of voluntary work on the part of the Church. The old rigid high and dry schools have had to make way for younger men with very varied forms of activity. Methods of religious propaganda have been borrowed, alike from Nonconformist and Roman Catholic sources. The Church has taken a vigorous interest in educational and social topics. Missionary enterprises, always strongly supported by the Low Church party, have been exceedingly vigorous. The exigencies of a Colonial Empire, the spread of commercial activity, have created new demands and the last hundred years have marked an immense increase in the religious activity and the enterprise of the Church. Including the Anglican Church in America the number of bishops now connected with the Church exceeds 300, and every 10 years the Conference at Lambeth marks the extent and growth of the Anglican Church.

As regards its hold upon the people there are no trustworthy statistics, but on the upper and upper-middle classes its hold is very strong. Amongst the working classes the greater majority are nominally adherents of the Church of England, but a great deal of the religious life is Nonconformist. As against Nonconformity the Church of England is little organized for political activity, and its hold upon the people and its influence are very intangible and indeterminable quantities. Probably, except perhaps in some of the great centres of the populace, its influence is very much greater than is often imagined.

**Statistics.**—According to the census of 1911 there were 14,614 ecclesiastical parishes, presided over by an incumbent or minister. In 1915 there were about 14,000 incumbents; 15,958 churches with sitting accommodation for 7,316,605; 2,500,000 communicants, and over 3,000,000 children attending Sunday schools. The voluntary offerings to the Church in 1913-14 amounted to over \$41,000,000.

**Bibliography.**—*History.*—The best continuous history of the Church of England is probably 'A History of the English Church' in eight volumes by various writers, edited by the late Very Rev. W. R. W. Stephens and the

Rev. William Hunt. Shorter histories are those by Wakeman, Spencer, Boyd-Carpenter, etc.

**Canon Law.**—'Reports of the Royal Commission on Ecclesiastical Courts,' published in 1881-83, and Manuals of Church Law, such as Phillimore's 'Ecclesiastical Law.'

**Prayer Book.**—Proctor and Frere, 'A New History of the Book of Common Prayer' (London).

**Doctrinal Formula.**—Gibson, Edgar S., 'The Thirty-Nine Articles of the Church of England.'

Much information concerning the Church of England may be found in the 'Report of the Royal Commissioners in Ecclesiastical Discipline,' bulletin c. 1906, and the annual reports of the Commissioners.

### 38. ENGLISH NONCONFORMITY. Early History.—Death of Queen Elizabeth.

—Nonconformity as a definite ecclesiastical movement in English history may be said to have had its origin in Elizabeth's reign. But regarded as a spiritual force appearing now and again and here and there in the nation, it may be traced back to a much earlier time. All who protested against the prevailing ecclesiastical assumptions of the clergy, and who dared to think and act for themselves in matters spiritual, may be regarded as Nonconformists, and were called to suffer for their faith. From 1401, when the statute for burning heretics came into force, to 1534, the date of the renunciation of Papal supremacy, no fewer than 111 persons were burnt at the stake; and from 1534 to 1558, the year Queen Mary died, 337 more were added to the roll of the protestant martyrs. On the accession of Queen Elizabeth it was hoped that a better day had dawned for those men of Puritan sort who desired to see the Reformation carried still further. But, while breaking with the Papacy as completely as did her father before her, the queen was not prepared to yield to what she regarded as their extreme views in the matter of religious ceremonial. She cared for order, pomp and appearance in the worship of the Church as in other things, and her princely power combined with her indomitable will made her supreme in ecclesiastical affairs. Several of the bishops and divines in the early years of her reign had been in close friendship with the continental Reformers and were prepared to go far in the Puritan direction. But the queen would not hear of it. Bishop Jewell writing to his friend Bullinger at Zurich in 1566 said: "I wish that all, even the slightest vestiges of Popery might be removed from our Church, and above all from our minds. But the queen at this time is unable to endure the least alteration in matters of religion." Thus began that conflict between the individual conscience and the power of the state church which has continued down to our own time.

The rupture between Elizabeth and the Puritan party first took open shape on the promulgation of the orders known as "Advertisements," which, in 1566, specified the minimum of ceremonial the State was prepared to tolerate in the services of the Church. Uniformity was to begin to be enforced at a given date, and

deprivation of benefice was to follow in the case of the clergy after three months' refusal of compliance.

The two sides thus having joined issue the Puritan party became divided, taking different directions. Many of the ministers conformed, using only such ceremonial as they were compelled, submitting to many things they did not approve in the hope of a better time when a simpler and, as they believed, a more scriptural system, might come to prevail. Others, again, while remaining in the Church, sought to bring about a radical change in the direction of Presbyterianism, the discipline of which was elaborately organized both in London and the Midlands, and a literature created which assailed with more and more of vehemence the existing establishment. In 1571 Thomas Cartwright, Lady Margaret Professor of Divinity at Cambridge, issued two addresses to Parliament under the title of "A First" and "A Second Admonition," which were elaborate attacks upon the Episcopal system and vigorous assertions of the divine right of the Genevan discipline. Having exercised this discipline privately for a time they proceeded to bolder measures, setting up their system openly in the parish churches of Northamptonshire and Warwickshire. Eventually, however, this movement was stamped out by the greater power of the State, and Nonconformity was henceforth to be sought for in other directions. Some of the Puritans became actual Separatists from the episcopal system. Their starting-point in church polity was the existence of spiritual life, the personal relation of the individual soul to God; and a church in their view was a community of spiritual men: "The kingdom of God," said they, "is not to be begun by whole parishes, but rather of the worthiest, were they never so few." Taking as their fundamental position that the Church visible consists of a company and fellowship of faithful and holy people gathered in the name of Christ, they went on to maintain that a Church so composed is competent for self-government. This self-governing power they further regarded not so much as a privilege to be enjoyed as a sacred trust to be discharged. The period when these men, who came to be known as Congregationalists or Independents, actively promulgated their views may be roughly stated as between 1570 and 1593. Their leaders during the first half of this period were Richard Fitz, the pastor of a London church, and Robert Browne and Robert Harrison who formed a Congregational church in Norwich in 1580; and the most active promoters of their principles in the second half of this period were Henry Barrowe and John Greenwood, who, together with John Penry, the Welsh martyr, suffered death for their opinions in 1593.

The penal laws against Nonconformity, severe before, were made still more severe by the Conventicle Act of 1593, which provided that all persons above 16 years of age being present at unlawful conventicles, should, on conviction, be committed to prison, there to remain without bail or mainprise until they made open submission and declaration of conformity at some church or chapel, or usual place of common prayer. The offender who refused to make such public submission within three months of conviction should be compelled "to

abjure this realm of England, and all other the Queen's Majesty's dominions forever." This sternly repressive Act explains why during the 10 years previous to the accession of James I so many Nonconformists languished in prison, while many were banished and many more went into voluntary exile.

**From the Accession of James I to the Revolution of 1688.**—With the death of Elizabeth and the accession of James I the hopes of the Puritan party once more revived. For the king had been brought up among Presbyterians, had been the pupil of George Buchanan, and a frequent hearer of the disciples of John Knox; and had even invited Thomas Cartwright, the leader of the English Presbyterians, to a professorship in Scotland. Regarding him, therefore, as at least not unfavorable to Puritan ideas, they met him on his way to London in 1603 and presented the Millenary Petition, so called, as representing the views of a thousand of the clergy. But again their hopes were destined to disappointment. At the Hampton Court Conference, held the following January, the king spoke contemptuously of Presbyterianism and declared he would either make these church reformers conform themselves or he would harry them out of the land. The Conference was followed by the Canons of Convocation which were so constructed as to make it impossible for any man who disagreed with the constitution and articles of the Church, as set forth in them, to remain honestly among its clergy. The immediate result was that some 300 ministers were ejected from their livings. The Nonconformists who had fled to Holland in search of liberty of worship after the Conventicle Act of 1593 were reinforced from time to time by the arrival of others of like mind. Especially memorable among these were the members of the little church at Scrooby in Nottinghamshire, who, under the leadership of William Brewster and John Robinson, fled to Amsterdam in 1608, and subsequently settled in Leyden. This was the church from which, in 1620, the Pilgrim Fathers of New England crossed the Atlantic as the founders of Plymouth Colony, the starting-point of the United States.

The Separatists who remained in England were subjected to perpetual hardships and persecution on account of their faith. James I was succeeded by Charles I, the new king coming completely under the influence of Archbishop Laud, who proceeded to great lengths in enforcing conformity to Prayer Book, articles and canons. While the two opposing forces of Catholic tradition and Puritan earnestness were thus contending within the arena of church life, the two opposing forces of absolutism and the desire for popular government were at the same time at war within the political sphere. The men who contended for the divine right of bishops maintained also the theory of absolute monarchy and the divine right of kings. The leaders of the Church made the serious mistake of allying its interests with the side hostile to the constitutional liberties of the nation. With a high-spirited people such a course could only have one issue—that of disaster and overthrow. The attempt to base the Church on the subversion of freedom ended in civil war and the temporary overthrow of the very institutions the advocates of absolute government sought to maintain.

After Charles and Laud came the Long Parliament and Cromwell. Two main ideas seem to have guided Cromwell's ecclesiastical policy—first, that there should be an established non-episcopal Church, on a broad basis of evangelical comprehension, to be endowed and controlled by the State; and next, that outside that Church there should be an ample toleration of Dissent, which therefore provided for the existence of separate congregations. The Church, as established, recognized no one form of ecclesiastical organization; it had no church courts, no church laws or ordinances. Nothing was said about rites and ceremonies, nothing even about sacraments. These were left as open questions to be determined by each congregation for itself. All that the commissioner, for each county dealt with was the personal piety and intellectual fitness of the minister presented by the patron to the living; and the church buildings were regarded as the property of the several parishes.

This loosely organized system came to an end with the ending of Cromwell's life. When the strong hand which alone was able to control the conflicting forces let loose in a time of civil war, fell powerless, the nation, weary of strife, restored the monarchy and with the restoration of the monarchy there came back also the episcopal system of government in the Church. In 1662 the Act of Uniformity cast out 2,000 of the ministers as being unable to give unfeigned assent and consent to all and everything contained and prescribed in the Book of Common Prayer. From that hour Nonconformity took definite and permanent shape in English national life. It defied all attempts to crush it out of existence. The Conventicle Acts of 1664 and 1670 sent thousands of godly people to prison where many of them died in the pestilential jails of the time. Others were ruined by heavy fines and the spoiling of their goods, but the more Nonconformity was oppressed the more it grew, and at length by the Declaration of Indulgence of 1672 the government was compelled to admit that no fruit had been gained by these forceful courses. Still after brief respite these forceful courses were resorted to again. Conventicles were again frequented; spies and informers renewed their dishonored calling and persecution went on its cruel and iniquitous way so long as the Stuart kings remained on the English throne. Happily sooner or later tyranny digs its own grave, and when William of Orange landed at Torbay, 5 Nov. 1688, the hour of deliverance had struck. The persecuted Nonconformists felt that the tidings were almost too good to be true. Year by year for a long period they observed the anniversary of their emancipation, exclaiming ever and again: "When the Lord turned again the captivity of Zion we were like them that dream. The Lord hath done great things for us whereof we are glad!"

**From 1688 to the Present Time.**—The Revolution of 1688 was followed by the Toleration Act of 1689 which repealed the Penal Acts and permitted Nonconformists to erect their own places of worship which were registered, and so placed under the protection of the State. To the providing of local habitation for their communities and their principles they addressed themselves with considerable energy. In the quarter of a century which elapsed be-

tween the accession of William III and the death of Queen Anne, besides many temporary structures, some 1,500 permanent places of worship were opened and maintained. The political history of Nonconformity in the 18th century is largely concerned with the endeavor to set aside certain disabilities to which its adherents were still subjected, the Toleration Act notwithstanding. The Corporation Act of 1661 provided that no person could be elected as mayor, alderman, recorder, bailiff, town clerk, or common-councilman who had not previously taken the sacrament according to the rites of the Church of England. The Test Act of 1673, though aimed mainly at the Roman Catholics, by widening the scope of the Corporation Act told heavily also against Protestant Nonconformists. It forbade any person holding office under the Crown, of any nature whatsoever, who could not produce a certificate to show that he had taken the sacrament at the parish church. Whoever offended against this law was thenceforth disabled from suing in a court of law, acting as guardian or executor, taking any legacy or deed of gift, or bearing any public office, and was further liable to a penalty of \$2,500.

These acts were unaffected by the Act of Toleration and were naturally felt by the Nonconformists to be a serious grievance. The Occasional Conformity Act of 1711 intensified this grievance. It provided that any person holding any civil or military office who should be found in a conventicle, or in any religious meeting of more than 10 persons, other than one conducted according to the rites of the Established Church, should forfeit the sum of £40, and be disabled for the future from holding any public office.

In 1717 an agitation was commenced for the repeal of these three tyrannical and disabling acts. A bill for the purpose was introduced into the House of Lords by Earl Stanhope, and on a second reading was carried by a division of 86 votes against 68; but on going into committee the clauses relating to the Test and Corporation Acts were withdrawn from the bill and it passed without them. Thus it came about that while the Occasional Conformity Act was repealed at that time it was not till 1828 that a bill for the Repeal of the Test and Corporation Acts received the royal assent.

Still in the interval between 1717 and 1828 several distinct steps were taken in the direction of liberty. In 1742 a dissenter was elected to the office of sheriff of the city of London, and on his refusal to qualify by taking the sacrament he was cited to the Court of King's Bench which decided against his claim to exemption. The Corporation then passed a by-law imposing a fine of \$2,000 upon every person who declined to stand for the office after being nominated and a fine of \$3,000 upon every person who, being elected, refused to serve. Again and again dissenters were nominated, and as they all refused to serve, fines were levied amounting in six years to more than \$75,000, which went toward the erection of the new Mansion House. In 1754 it was resolved to make a stand against this oppressive procedure. After a lawsuit which was traversed from court to court, and which lasted for 13 years, Lord Mansfield, by his memorable and scathing judgment of 1767, put an end to the iniquity forever.

This gain in the direction of freedom was followed by another in 1779 when Protestant Dissenting ministers and schoolmasters were no longer required to sign the Thirty-nine Articles. In 1812 the Quakers' Oaths, the Conventicle and Five-Mile Acts, which till then had remained on the statute book, were repealed and the Free Churches were placed in respect to legal protection from disturbance during times of public worship, on an equality with the Established Church.

The repeal of the Test and Corporation Acts in 1828 was followed by the great Reform Bill of 1832 which did much to introduce the rule of the middle class in English society. The result was a large accession to the strength of Nonconformity, both political and social. Their influence entered more fully into the stream of the national life. They were found taking active part in Parliament and in municipal councils, the national universities were thrown open to them in 1871, and as the result of a recent religious census it was found that quite half of the worshipping population of the country were in attendance on the Nonconformist churches of various denominations. It may be well to add to this historical sketch of the older Nonconformity a brief reference to the later born but powerful religious society known as Wesleyan Methodism, which taking its rise in the 18th century, has gone on developing and consolidating ever since. Its internal history is largely that of a struggle for greater freedom and an increased representation of the laity in the government of the Church. Neither Wesley himself nor the other early leaders in Methodism believed in democratic government in ecclesiastical affairs, and continued resistance on their part to the extension of the lay element in the Conference led to one secession after another, these separating bodies forming sister communities. Still while working with more breadth and democratic freedom they remained loyal to the doctrines held by the great founder of Methodism and to the ecclesiastical system he had elaborated. These various off-shoots are known as the Methodist New Connexion, the Primitive Methodists, the Bible Christians, the Wesleyan Reform Union, the United Methodist Free Church and the Independent Methodist Church. Notwithstanding these successive secessions and some occasional disasters the original Wesleyan Society has shown marvellous vitality, elasticity and resource. While in 1816 in Great Britain and Ireland there was a membership of 241,319, according to the latest minutes of Conference that membership has risen to 600,750. If we add to this the number of members belonging to the various branches of Methodism outside the main body, to the Foreign Missions, to the French Conference and to the South African Conference we reach a total of nearly 2,000,000. For the due care of this large body they have an ordained ministry of 4,329, besides 40,308 lay preachers.

Passing from Wesleyan Methodism to the Free Churches generally it may be mentioned that these various bodies of Christians outside the Established Church have in recent years entered into a sort of federation without sacrificing their separate self-government. This federation is known as the National Council of the Evangelical Free Churches and consists of representatives of the local Councils of the Con-

gregational and Baptist churches, the Methodist churches, the Presbyterian Church of England, the Free Episcopal churches (including the Moravians), the Society of Friends, and such other evangelical churches as the National Council may at any time admit. In 1915 there were in England and Wales (communicants): Baptist, 390,183 and 540,145 Sunday school children; Congregationalist, 454,748, and 634,585 children; Presbyterians, 87,667, and 90,521 children; Quakers, 2,836, and 21,407 children; Church of Christ, 12,535, and 15,893 children; Moravians, 3,427, and 5,144 children; and other smaller bodies making up a total of 2,136,782 Nonconformist communicants and 3,219,633 Sunday school children; sitting accommodation for over 8,000,000; 9,364 ministers and 50,787 lay preachers.

Formerly Chairman of the Congregational Union of England and Wales, Lyman Beecher Lecturer at Yale University, author of 'History of the English Bible' (1911), etc.

### 39. ENGLISH ROMAN CATHOLICS.

**History.**—The Roman Catholic Church in England is descended from those who in the reign of Elizabeth refused to accept the Reformation (q.v.) and remained in communion with the See of Rome. Nearly all the English bishops were included in this number and were deprived of their sees and stringent laws were made with a view to enforcing conformity with the established religion. Notwithstanding these, however, and the fact that they were frequently put

into execution, the number of those who adhered to the Roman Catholic faith was, for a time, very considerable. No form of ecclesiastical government was instituted at first, as hopes were entertained of a national reunion with Rome; but in the meantime, in order to perpetuate a succession of clergy, several colleges were established on the Continent, in which also the laity obtained their education. Chief among these was the college at Douay, in Flanders, founded by Cardinal Allen in 1568. Others were in Rome, Paris, Saint Omer, Seville, Valladolid, Lisbon, etc., several owing their origin to the well-known Jesuit, Father Parsons. Most of these still exist, some on their original sites, while others, having come to an end during the French Revolution were refounded in England, for the laws against Catholic schools had then been relaxed. It was undoubtedly due to the English colleges abroad that the Roman Catholics in England were saved from extinction.

Early in the 17th century, when the hopes of reunion had become remote, an attempt was made to form a proper ecclesiastical government for the Roman Catholics; but it was not until the reign of James II that affairs were put on a permanent footing. England was then divided into four "districts"—the Northern, Western, Midland and London—each under the government of a bishop called a "Vicar Apostolic." This means the he was, by a kind of legal fiction, bishop of an Asiatic see "*in partibus Infidelium*," and he ruled his actual "district" with authority delegated directly by the Pope. Thus the first "Vicar Apostolic" was nominally Bishop of Chaldean. A similar arrangement was made a little later in Scotland. And all the colonies having no ecclesiastical government of their own, were considered as belonging to the "London District," so that in early days, the Roman Catholics of North America were under the London "Vicar Apostolic." The beginnings of the present American Roman Catholic hierarchy date from the time of the War of Independence. In England the government by "Vicars Apostolic" continued until the establishment of the hierarchy in 1850; in Scotland it lasted until 1878.

After the brief reign of James II new penal laws were enacted against Catholics and the time which followed may be considered the low water mark of Roman Catholicism in England. The hopes they had placed in the Stuarts had failed and the outlook seemed dark and dreary. There were numerous defections about that time and hardly any converts were made to replace them. The only centres where the Catholic religion could be regularly practised were the country seats of the old Catholic families and in London the chapels of the various Roman Catholic ambassadors.

Toward the end of the 18th century, however, there were signs of better times for them. The penal laws were mitigated by Parliament in 1778 and practically abolished by a second Act in 1791, after which Catholic chapels began to spring up in many of the larger towns and a certain number of conversions were made. Roman Catholics were still, however, disqualified from sitting in either house of Parliament, and were under many other civil disabilities. These were not formally removed until the Act

of "Catholic Emancipation," obtained by the agitation of O'Connell and the Irish in 1829.

Three events of later time must be briefly alluded to, as having had a permanent effect on the state of English Catholics. One was the French Revolution, which had a double effect. In the first place, it drove back to England the numerous communities of English monks and nuns, who had settled abroad during penal times, and by accustoming the people in England to their presence amongst them, prepared the way for the rapid multiplication of such institutions in later times. In the second place, it caused some thousands of French priests to take refuge in England, where they were received with marked hospitality, and considerable sums both of private and public money were apportioned to their relief. Most of them indeed returned to France on the signature of the concordat between Napoleon and the Pope in 1801; but a certain number remained in England and founded missions or other Catholic works, some of which still continue. The second event to be alluded to was the great immigration of the Irish after the potato famine in 1845-49, which was the chief cause of the rapid increase of the Catholic congregations at that time and later. The third was the Oxford Movement (q.v.), which though it did not have such a great effect numerically speaking, nevertheless brought over men of standing and influence who have left a lasting mark on the Church. The names of Newman, Manning, Faber, Ward, Oakeley are only some of many that might be mentioned in this connection.

**Present Ecclesiastical Organization.**—At the present day the Roman Catholic Church in Great Britain is ruled by 26 archbishops and bishops, who are divided thus: England and Wales, three archbishops, of whom one is a cardinal, 13 suffragans and three auxiliary bishops; Scotland, two archbishops, one archbishop coadjutor and four suffragan bishops; Ireland, four archbishops (one a cardinal), 23 bishops and one bishop auxiliary. The titles of the English sees were expressly chosen to be different from those of the Established Church, though the latter have since adopted three of the Roman Catholic titles—Liverpool, Birmingham and Southwark. Each diocese has a chapter, though there are no resident canons; they are chosen from among the senior clergy of the diocese and meet at stated intervals. There have been four archbishops of Westminster—Cardinal Wiseman (1850-65); Cardinal Manning (1865-92); Cardinal Vaughan (1892-1903); and Cardinal Bourne since 1903. The new cathedral at Westminster was begun under the direction of Cardinal Vaughan in 1895. It is in the early Christian Byzantine style, the architect being the late Mr. J. F. Bentley, who died during its construction in 1902. The number of priests in England and Wales in 1915 was 3,985, with 1,879 churches, chapels and establishments; Scotland, 583 priests and 428 churches, chapels, etc.; the number of priests in Ireland was given as 3,750. Roman Catholics in England and Wales are estimated at 1,900,000; Scotland, about 545,000, and Ireland, according to the 1911 census, 3,242,670.

Since the abrogation of the penal laws more than a century ago, mission churches have rapidly multiplied throughout the country, and few

towns of any importance are now without one. Some have been built by individual rich Catholics, and are good specimens of architecture: for example, the church at Arundel, built by the Duke of Norfolk in 1873, or that at Cambridge, built by Mrs. Lyne Stephens in 1890; and a certain number of handsome churches have been built by subscription, a prominent instance being the Oratory at Brompton, opened in 1884. Moreover, the influence of the elder Pugin, who was a Roman Catholic, is largely visible in the churches set up during the early days of the Gothic revival. Nevertheless, the large majority of Catholic churches bear evidence of the poverty of that community as a whole, and have been built with the sole view of securing a maximum amount of accommodation at a minimum of cost.

In their practical working the missions do not differ much from parishes, though they are not canonically constituted as such. The clergy, being unmarried, live together in a house or "Presbytery." They are supported entirely by voluntary contributions. For the most part they lead laborious lives, ministering to the wants of their people, most of whom belong to the poorest classes. There is also a large section of the clergy known as "Regulars," including Jesuits, Benedictines, Dominicans, Franciscans, as well as the modern Redemptorists, Passionists, and other similar congregations. They commonly live in monasteries or large houses; but in the present state of England they often find themselves obliged to undertake the care of missionary churches, like the secular clergy.

**The Laity.**—From what has been said, it will be seen that the Roman Catholic laity belong to three very heterogeneous groups: (1) The hereditary English Catholic, consisting of a number of county families, and in some few districts, such as Lancashire and parts of Yorkshire, and elsewhere, some of the working classes; (2) converts, or children of converts, of whom there are usually a certain number in most town missions; and (3) those who are Irish, or partly Irish, by descent, who form the majority of the congregations, many of them belonging to the poorer classes of the population. The prejudices of former times are steadily dying away, and Roman Catholics in general live on good terms with their neighbors. They intermarry to a certain extent, but such "mixed marriages," as they are called, are discouraged by the ecclesiastical authorities and a special permission is requisite for each. Many Roman Catholics may now be found occupying prominent positions on county councils, boards of guardians, or other public bodies. In politics, owing to the composite nature of the body, they are divided, almost every shade of political opinion being represented amongst them; but in general it may be said that while the majority, including almost all the Irish, sympathize with the Liberal party, many of the upper class hereditary Catholics have in recent years become strong Conservatives. When Catholic interests are at stake, however, those of all political views unite on a common platform.

**Education.**—Very remarkable energy and perseverance has been shown in providing elementary schools for Catholic children, and there is one attached to almost every mission. In spite of past difficulty and poverty, they have

usually been carried on very efficiently. Training colleges for the supply of Catholic teachers, both male and female, exist in various parts of the country. There are numerous poor law, reformatory and industrial schools. In the provision of secondary day schools Catholics are less well off, though there are a certain number of efficient ones in some of the chief towns; but the boarding schools for the upper classes are on a very large scale in proportion to their numbers. The chief ones—Stonyhurst, Ushaw, Beaumont, Downside, Ampleforth, Old Hall, and others, are all equipped fully up to the standard of modern requirements. Some of them are descended from the English colleges on the Continent which were broken up during the French Revolution; others, as for example Cardinal Newman's school at Birmingham Oratory, have been founded in more recent times.

Until a few years ago, Roman Catholics were forbidden to attend the National universities; but in 1895, in response to a petition from the laity, the law of the Church was relaxed, and there are now many Catholic undergraduates at Oxford and Cambridge. They are scattered in the various colleges, and mix freely in the general life of the university, but there is in each case a centre, where lectures on Catholic subjects are given periodically, and there is a Catholic Debating Society both at Oxford and at Cambridge.

**Convents, Charities, etc.**—One of the features of Roman Catholic life in England during the last 50 years has been the rapid multiplication of convents. In a large number of cases the nuns devote themselves to the work of education, either in the parish (primary) schools, or by conducting a secondary school of their own, either for boarders, or day scholars, or both. Others work among the poor, or undertake the care of the sick or the aged, or the unfortunate, while a certain number belong to "enclosed" orders, and give themselves to a life of prayer. Many other homes, orphanages and "rescue" societies deserve to be enumerated; nor ought we to omit at least a mention of the Catholic Truth Society, for printing and distributing cheap Catholic literature among the poor, in these days an essential provision for Catholic life.

**Bibliography.**—For details of the present state of Roman Catholics, see 'Catholic Directory,' published annually under authority.

The following books may be consulted on the history of the Roman Catholics in England, from their point of view: Dodd's 'Church History of England' (Dodd's real name was Rev. Hugh Tootell. His history was published 1737-42); Tierney's 'Dodd.' (The notes of Canon Tierney form a very valuable addition, and make this practically a new book; but it breaks off at about 1640, and was never finished. It was published in 1839-43. Both editions of Dodd are often met with in second-hand catalogues); Lingard's 'History of England'; Sander's 'Rise and Growth of the Anglican Schism' (Lewis's translation [1877], the Latin original [1585] having run to over 30 editions); Challoner's 'Memoirs of Missionary Priests, 1577 to 1664' (1st ed., 1741-42; many times republished); Berington's 'State and Behaviour of the English Catholics from the Reformation to the year 1780' (London 1781); Butler's

'Historical Memoirs of English and Scottish Catholics'; Milner's 'Supplementary Memoirs.' (These two books formed part of a long and acrimonious controversy on Catholic affairs between Bishop Milner, Vicar Apostolic of the Midland District, and Charles Butler, the distinguished lawyer, who on the passing of the Emancipation Act in 1829 became the first Roman Catholic K. C. Butler's Memoirs appeared in 1819, and Bishop Milner wrote to correct what he considered misrepresentations of Butler. Both books are still fairly commonly to be found); Husenbeth's 'Life of Milner' (1862); Flanagan's 'History of the Church in England' (1857); Oliver's 'Collectanea' (1857); Ullathorne's 'History of the Restoration of the Catholic Hierarchy' (1871); Mazière Brady's 'Annals of the Catholic Hierarchy' (1877); Foley's 'Records of the English Province S. J.' (8 vols., 1877); 'Records of English Catholics' (edited by Knox); Vol. I, 'Douay Diaries'; II, 'Letters and Memorials of Cardinal Allen' (1878-82); Amherst's 'History of Catholic Emancipation' (1886); Morris, 'Catholic England in Modern Times' (1892); 'The Catholic Church During the Last Two Centuries' (Lord Bray's Prize Essay 1892); Bernard Ward's 'Catholic London a Century Ago' (1905); Gillow's 'Biographical Dictionary of English Catholics'; Wilfrid Ward's 'Life and Times of Cardinal Wiseman' (1897); Purcell's 'Life of Cardinal Manning' (1896; a book full of inaccuracies, but containing much valuable documentary matter).

BERNARD WARD,

*President of Saint Edmund's College, Domestic Prelate to the Pope (1895) and Roman Catholic Canon of Westminster; author of 'A Sequel to Catholic Emancipation' (1915).*

**40. ENGLISH JUDAISM. Historical Summary.**—Though the statements as to the presence of Jews in Roman and Saxon England are more or less legendary, it is tolerably certain that William I brought a number of Jews with him from Rouen to England. Under the Normans, the Jews enjoyed some privileges; they developed a communal life of culture and distinction; but they were practically restricted to financial pursuits as a means of livelihood. Henry I granted them a charter, but at the coronation of Richard I serious massacres occurred in London and elsewhere, especially at York, where the ordeal of martyrdom was heroically endured. The 'Exchequer of the Jews' was then founded to preserve the Jews from some of the effects of such riots and to enable the Crown, as chief partner in the Jewish money-lending business, to secure its share of the gains. By the middle of the 13th century the Jews were chattels of the King, and their unpopularity on religious grounds was increased by the power they gave the King to obtain a revenue independently of barons and people. In 1275 the *Statutum de Judaismo* forbade the Jews to lend money, and as there was no other function for them in feudal England their expulsion followed as a matter of course in 1290. For the next three and one-half centuries a few Jews visited England from time to time; Queen Elizabeth had a Jewish physician. Toward the middle of the 17th century a number of Marano merchants came to the front in English colonies

and in England itself. These men, who had escaped the Spanish Inquisition by assuming an outward garb of Roman Catholicism, now boldly asserted themselves as Jews, and in 1655 Cromwell, as a result of the Whitehall Conference of that year, connived at the open resettlement of a Jewish community in England. But two centuries more were to pass before the English Jews obtained full civil and political emancipation. In 1753, Pelham prematurely passed a naturalization bill, which he was forced to repeal next year. The struggle recommenced in 1830. In the years 1828-29 Protestant Dissenters and Roman Catholics were relieved of most of their disabilities. But the Jews were still excluded from Parliament, from membership of the University of Oxford, and from degrees and posts of emolument in the University of Cambridge. Nor could they occupy high posts in the army or navy. Political emancipation was won in 1858. In 1870, following on the senior wranglership of a Jew, the University Tests Act conferred full scholastic rights on the English Jews. In 1858 Baron Lionel de Rothschild took his seat as a member of the House of Commons, and in 1885, his son, Sir Nathaniel de Rothschild was raised to the peerage—the first Jew so distinguished. Since 1858, many English Jews have sat in Parliament; there has been a Jewish Master of the Rolls; in 1915 Lord Reading, a Jew, became Lord Chief Justice of England; and in the civil, military and diplomatic services a goodly array of Jews has become prominent.

**Statistics.**—In 1290 the number of Jews who left England amounted to 16,000. At the Restoration of Charles II there were about 40 Jewish families in London. The increase was slow in the 17th century, but toward the end of the 18th century there was a larger immigration. Colquhoun estimated the Jewish population of London as 20,000 at the beginning of the 19th century, which would bring the total for the British Isles to about 25,000. This estimate is probably too high, for it is doubtful whether there were more than 60,000 Jews in the country before the Russian immigration of 1881. Mr. Jacobs calculated that in 1901 there were nearly a quarter of a million Jews in the British Empire, of which number 160,000 were in the British Isles. In 1915 there were about 245,000 Jews in the United Kingdom, with 200 synagogues.

**Organization.**—Since the dispersal of the Jews from Palestine in the first centuries of the Christian era, the organization of Jewish communities has been almost invariably on an independent congregational basis. Each congregation in the mediæval period constituted an independent unit. Sometimes there would be a combination of these units for certain purposes, as in the famous council of Four Lands in Poland (c. 1550-1750). In the pre-expulsion period in England, there were officials who bore the title "Presbyter Judæorum" and who were the acknowledged leaders of the whole Anglo-Jewish community. Such officials were closely connected with the royal finances in so far as they affected the Jews, and were more or less responsible for assessments of tallages. When the Jewish community was re-established in the 17th century, the old congregational system was restored. There was first the Sephardim or "Spanish and Portuguese" Congregation

which for long took the first place in the guidance of the whole Jewish life of London. Founded by a body of men distinguished alike for culture and commercial capacity, this congregation gave to English public life many a noble son. They bore a considerable part in developing Colonial trade. This congregation, whose present Bevis Marks Synagogue was consecrated in 1701, was governed by a Mahamad or Council of Elders with an ecclesiastical head or Haham. The Mahamad claimed and exercised considerable power over all the individual members. Gradually, however, the leadership passed into the hands of the Ashkenazim or "German" Jews. At first each German congregation was completely independent, and this condition continued with more or less completeness till 1870 when the United Synagogue was founded. A large number of Metropolitan Jewish congregations are constituents of this united body, but the Sephardim have maintained their complete independence, and besides a few German congregations of old foundation which have remained outside the union, there was established in 1841 a West London Synagogue of British Jews which introduced some ritual reforms and placed itself (as it still remains) in an independent position. The increase of foreign Jews had, however, led to the formation, especially since 1880, of a considerable number of smaller East End congregations outside the Metropolitan Union. These were "federated" in 1887. It is difficult to define the exact condition of the Jewish communal organization at the present time. The Chief Rabbi is the official head of the great bulk of the congregations of the British Empire, but except for statutory powers conferred over the constituent Synagogues of the united Synagogues by the act of 1870, the influence of the Chief Rabbi depends on the voluntary acceptance of his jurisdiction by the various congregations. As to the rest of the communal organization, it does not differ from that found in other Jewish centres all the world over. The distinctive mark of Anglo-Jewish arrangements is perhaps the tendency to centralization. In Germany and in America there are Rabbis for every separate congregation; in England there are "Ministers" who preach and teach rather than Rabbis who exercise judicial functions. But there are many indications that the centralization is in process of breaking down. Certainly the organization of the English Jews on its religious side is now in a transitional phase. On the other hand, charitable and philanthropic organization is in a condition of first-rate efficiency.

**The Communal Life.**—Cromwell readmitted the Jews unconditionally, and though the acquisition of political rights was a slow process, the English Jews were never subjected to restrictions of the Ghetto type. On the other hand, the fact that emancipation in England was gradual and not sudden gave the English Jews a training in civic adaptability which had rather exceptional consequences. The Jew easily assimilates, but in England assimilation was not accompanied with any wide-felt desire to forsake Judaism. The English Jews who have taken the lead in serving the state have on the whole been identical with the English Jews who have served the synagogue. The Disraeli family

was an exception that proves the rule. But while English Judaism thus gained in coherence and stability by the fact that the leadership of the community was in the hands of its chief men of affairs, the communal life suffered some loss of idealism. English Jews have, indeed, consistently taken the lead in dealing with crises in the fate of the Jews of the world, but on the whole, communal life was respectable rather than brilliant. The institutions which resulted were, however, striking examples of practical philanthropy. The Board of Guardians for the relief of the Jewish poor (founded in 1859) occupies a high place among institutions of its class. It not only prevents the Jewish poor from falling on the rates, but it takes an enlightened view of the aims of poor-relief, fostering self-help by a carefully organized system of loans and emigration. Another characteristic institution is the Jews' Free School (founded 1817). This is probably the largest school in England, and it has served the cause of education while at the same time providing a friendly atmosphere for the children of alien parents. Considerable changes have followed on the increase of foreign Jews. The whole communal life has been vivified. In the first place, the presence of these Jews for the first time made evident a passing wave of anti-Semitism which culminated in the futile Alien Bill. Anti-Semitism has no deep roots in England, but the anti-Alien agitation did undoubtedly rouse the Jews of England to a sense of their responsibilities. Again, the Zionist and Territorial schemes introduced some of the previously lacking idealism. The absence of Jewish Mission deprives the Jews of a powerful driving force. But there is one important Jewish missionary society—a society of Jews with a mission to Jews. The Anglo-Jewish Association (founded 1871) has, under the enlightened presidency of Mr. C. G. Montefiore, had its horizon widened partly by the Hirsch Colonization Scheme which is directed in part by the Anglo-Jewish Association, and partly by the revived interest felt in the Jews of the world in consequence of the propaganda of Dr. Herzl and Mr. Zangwill. The Russian persecutions had considerable influence in the same direction. The general result has been that the leadership of the community is passing from the men of affairs to the idealists, and though there would be serious danger were this process carried too far, there can be little doubt that the change is on the whole fraught with advantage. As another token of present-day idealism may be instanced the initiation of a literary revival. English Jews have not played a foremost rôle in the promotion of Jewish learning. While the 'Dictionary of National Biography' was edited for the larger part by a Jew (Sir Sidney Lee), and the British Academy was founded by another Jew (Israel Gollancz), though Jews have filled professorial chairs at the Universities and though there have been two Jewish R. A.'s, the literary performances of Jews in the field of specifically Jewish learning have been insignificant. But a new spirit is now discernible, or rather the old Jewish spirit has invaded the English Jewry. Thus, without enumerating the many institutions which are the just pride of the community, without detailing the eminent service to the state rendered by English Jews, it

may be said generally that the practical spirit which has so long directed the current of Jewish life is now receiving a long-needed infiltration of idealism. In no part of the world is there greater hope for Judaism. Fulllest toleration is enjoyed and more than toleration, sympathy. Fulllest civic and political rights are the possession of English Jews. And above all there is undoubtedly a genuine affection for Judaism. Official Judaism is not in a thoroughly healthy condition, but there is in the general mass of Jews a sturdy confidence in the religion and an immovable hope in its power to civilize and save sobriety, good citizenship, devotion to the state, and a practical appreciation of all humane virtues are being once more touched by the fire of enthusiasm. Judaism is not only a creed and a code, it is a life. In England this principle seems likely to reassert itself. The English Jew is pre-eminently an Englishman, and he may become at one and the same time pre-eminently a Jew.

**41. BRITISH EDUCATION.** **Introductory.**—For a history of the early days of British education the hour has not yet come. Even the origin of the two ancient universities remains obscure. The records of secondary schools, with very few exceptions, do not begin before the Reformation, though the claim of King Edward VI to be a patron of education has been shown to rest rather on having attached his name to a portion of the older foundations, of which a considerable number were destroyed under the Chantry Act of 1547. Elementary education was a matter too humble to receive much definite permanent record, and probably, as in Scotland till recent years, it was frequently given in the same schools in which the elder children were being prepared for the universities. Neither taxes nor rates were levied for education before the 19th century (to speak in general terms), and the only method of maintaining any permanent educational institution was by means of endowment. Considerable sums were devoted to this end in the reign of Elizabeth, and, after the troubles of the civil wars were over, there was an outburst of endowment in the end of the 17th and beginning of the 18th centuries.

ENGLAND.

**Elementary Education.**—Two important factors in spreading elementary education were the Society for Promoting Christian Know-

edge, founded in 1698, and the Sunday school movement, crystallized in the foundation of the Sunday School Society in 1785, and representing largely the Evangelical Revival of the 18th century.

The educational work of the Society for Promoting Christian Knowledge was in 1811 transferred to the "National" Society (The Society for Promoting the Education of the Poor in the Principles of the Established Church), which for the time being was devoted to carrying on schools on the "Madras" monitorial system, as organized by Dr. Andrew Bell. In 1808 a society, known subsequently as the British and Foreign School Society, was founded, chiefly by Nonconformists, to establish schools on an almost identical system which had been developed by Joseph Lancaster. The provision of elementary schools in England and Wales was thus in the beginning almost entirely the work of those connected with religious bodies, of which the Church of England was numerically and financially by far the most important. These voluntary schools, aided since 1833 by gradually increasing grants from government, continued to hold the field alone until 1870. Since the introduction of board schools, supported by rates, at that date, and even since 1902, the voluntary managers have gone on raising considerable sums of money, which, however, of late years, have been devoted chiefly to building and maintaining the fabric of their schools.

The religious difficulty in English elementary schools has thus been involved in their very origin.

It was not till 1833 in the first Reform Parliament that the State came to their aid. In that year the House of Commons made a money grant of \$100,000, which was apportioned between the two societies, and it was not till 1839 that the government education department for directing the administration of the grant was established. The grant was gradually increased, and between 1850 and 1860 rose from \$725,000 to \$1,000,000 for Great Britain. In 1880, it was \$12,500,000 for England and Wales only, and now is over \$55,000,000 for elementary education. The years between 1840 and 1860 were years of great expansion. The population, which in 1821 had been under 9,000,000 in England and Wales, by 1861 numbered 20,000,000. The government education grants greatly encouraged the clergy of all denominations, and schools sprang up in all directions. In 1861 the economists took fright, and severe mechanical tests were applied to the system of grants by the "Revised Code." Payment was to be made only on the results of individual examination of every pupil, in reading, writing and arithmetic. Undoubtedly some check was needed on a system advancing so rapidly and with teachers so ill prepared as many were for their profession. But the method adopted was disastrous, and its cramping influence is felt in the traditions which exist to-day, years after the last relics of this method of payment by results have been abolished.

By 1870 it was quite plain that, magnificent as the efforts of the churches had been, nothing short of a national local system could provide the necessary schools, especially in the large towns. The Elementary Education Act of that year enabled boroughs and parishes to

form school boards, with powers (if necessary) to levy a rate for building and maintaining schools in addition to the building grants and other grants from the State. The central education department had after due investigation to declare what school accommodation was needed in each district. If in any case it were not duly supplied, they might order the formation of a school board; and in case of further default appoint such a school board themselves. Existing voluntary schools were to receive the government grant, but no aid from rates. They might still give such religious instruction as they thought fit. In the board schools no religious catechism or religious formulary distinctive of any particular denomination was to be taught. This regulation is known as the Cowper-Temple Clause, from the name of the member who introduced it as an amendment. Subject to this a school board might give in its schools such religious instruction as it thought fit, or might abstain from giving any. As a matter of fact, except in some places in Wales, where the religious instruction is given in Sunday schools, plain Bible lessons are given by the ordinary teachers in all these schools with very few exceptions. Any school board might make by-laws enforcing the compulsory attendance of children between 5 and 13, subject to a conscience clause, and a number of school boards were established for this purpose only. In 1876 attendance was made compulsory in all districts by the establishment of school attendance committees where no school boards existed. The provisions for compulsory attendance have been strengthened and diversified by four subsequent acts, and are further complicated by conflicting Factory and Workshop Acts, so that the whole now urgently need consolidation. In 1891 fees were abolished in most schools, a process nearly completed since 1902.

The act of 1870 aroused the most intense opposition at once from the Church party and the extreme Nonconformists. The latter were disappointed of their hopes of a uniform national system, the former found themselves in competition with a rival subsidized by the State. The greatest activity prevailed on both sides in providing additional schools. Between 1869 and 1876 provision was made in elementary schools for 1,600,000 additional children, and of these two-thirds were in voluntary schools, toward the cost of which only one-fifteenth was paid in government building grants. Educational enthusiasm was not, however, the sole factor; in many cases the chief ratepayers realized that they could build and maintain the schools far more cheaply by voluntary subscriptions than under the administration of a school board, and large corporations such as railway companies, were willing to contribute to voluntary schools for similar reasons. The voluntary system had proved wholly inadequate in the large centres of population, but still prevailed in the majority of country villages.

By the end of the century the time was ripe for further legislation. Secondary education was in chaos, and it was imperative that it should be co-ordinated with the elementary system. The development of the latter moreover was in many places completely at a standstill and unlikely to be further improved under existing conditions. The tendency to local self-government had rapidly increased during the past

few years. In 1888 the Local Government Act established county councils, and in 1894, by another act, district and parish councils were constituted. In 1889 the Technical Instruction Acts had authorized the county and borough councils to supply technical instruction, and the vast majority of them were spending for this purpose the large sums of money handed over to them in 1890 by the Local Taxation (Customs and Excise) Act. They had thus already some experience as education authorities. On the other hand, the requirements of the education department (which in 1899 had been reorganized as the board of education) had been steadily growing, in accordance with modern ideas of education, so that the voluntary schools began to find it impossible in most cases to obtain the money requisite to keep them efficient.

Accordingly in 1902 a fresh Education Act was passed. By this every county, every county borough (i.e., to speak roughly, city of more than 50,000 inhabitants), and (for elementary education) every urban district of over 20,000 inhabitants and every non-county borough of over 10,000 became local education authorities, and all school boards were abolished. Each new authority must appoint, according to a scheme approved by the board of education, an education committee, which they are bound to consult, and to which they may delegate all powers for education except that of raising money. The voluntary schools must give their religious teaching in accordance with the terms of their trust deed (if any), and it is under the control of their managers. They appoint and dismiss their own teachers, subject to the consent of the local authority which pays them. The voluntary managers are responsible for the upkeep of their buildings, subject to an allowance from the authority for internal fair wear and tear, but the local authority is bound to maintain and keep the schools efficient otherwise, at its own expense. Each voluntary school is managed by a body of managers, usually six, of whom two-thirds are appointed under the trust deed, amended by Order if necessary, and one-third by the local authorities. Board schools are now known as council schools. The managers are appointed by the local authorities. In counties two-thirds are appointed by the county council, and one-third by the local district or parish council. To the managers such powers are at present delegated as the central local authority thinks fit. London was excepted from this measure but received an analogous act in the following year.

Unsatisfactory as many of the provisions of this act were to the politician and to the religious controversialist, there can be no doubt that from the point of educational administration over the country as a whole, it has brought about great progress, an advance proportionately almost as great as the act of 1870. Even in those cities where there was already a strong progressive school board, it has concentrated the powers for higher as well as for elementary education in the hands of one authority, has materially increased the grant, and has given considerable powers over the standard of accommodation and of staffing in the elementary schools. In the counties moreover it has abolished the small rural school boards, whose sole object was to reduce expenditure, and has placed in charge an authority which can apply a rea-

sonably high and uniform standard of efficiency in staffing, in school accommodation, in hygiene, in school material, in school attendance, and even in the small, but important matters of school cleaning and offices.

On the other hand the act of 1902 met with the most violent antagonism from the enemies of the voluntary school system. It was urged with good reason that complete maintenance from the public funds should be accompanied by full public control, that no denomination should be allowed to have instruction in its tenets given at the public cost, and that in any parish where there is only one school, the children of the minority, who have no alternative but to attend it, are liable to suffer from a stigma attached to the exercise of the conscience clause. Nonconformist teachers moreover found it difficult to obtain engagements in church schools or places in training colleges of which very few are undenominational. The Church party on the other hand were not unreasonably unwilling to allow only undenominational religious instruction to be given in schools which they had built, largely at their own expense, for denominational instruction, and claimed a right to have such instruction for their children.

A complex Education Bill passed the House of Commons in 1906, but fell through. Another, in 1908, went no further than a second reading. In 1914 there was approximately one certificated teacher to every 49 scholars in England and to every 60 in Wales. Important changes have been made since 1911 in the training of teachers. There were 13,093 training colleges in England and Wales in 1916. In 1914 provision was made for feeding poor children in addition to educating them. During the first year 39,596,018 meals were supplied to 421,975 children. All pupils undergo medical inspection. The total expenditure on elementary education in England and Wales for 1913-14 amounted to \$71,843,970, for 21,498 schools with an average attendance of 5,420,000 scholars.

**English Secondary Education.**—The best defense of English secondary schools at any rate during the past century, is that they have successfully educated a large number of men of high character and ability who have served the nation well in political and administrative life, not only in England, but all over the world. There was, however, till recent years, nothing that could be called a system. Each school utilized or abused its endowments and its opportunities, and the abuses were very slowly revealed by the inquiry of royal commissions, and still more slowly corrected. Although inquiries began in 1818 under Brougham, it was only in the "sixties" that the reports of the commissions on the great "Public Schools" (nine in number) and on the endowed schools led to two acts of reform, the Public Schools and the Endowed Schools Acts, and under these most of the abuses of endowments have been brought to an end.

But in the leading English "Public Schools" (i.e., the leading secondary schools for boys, and principally for boarders), a considerable measure of reform had come in early days from within. The twin names of Arnold and Rugby are best known, but the Rugby reform was in part inspired by Winchester, and great names are not wanting to Eton and Harrow

which with the many glaring defects they possessed at that period were relatively efficient. From Arnold and his successors, Temple and Percival, influence radiated and few schools failed to become different, whether by attraction or repulsion. Thriving at Uppingham, Vaughan at Harrow, Cotton and Bradley at Marlborough, Bradley at Haileybury, were mighty instruments in "changing the face of education all through the public schools of England."

Not only have science and modern languages been introduced, as well as opportunities for the arts and manual instruction, but the teaching of Greek and Latin has to a great extent been remodeled. Physical development, which was always encouraged in those schools by games, has been pushed to a degree which now makes against intellectual interests. Nearly all the so-called first grade schools are boarding schools, and consequently the corporate life gives far greater scope to the influence of masters and of boys, and thus to education in the widest sense, than is possible in day schools. For good or evil, the effects are more marked, and on the credit side must be set that independence and self-reliance which the best schools produce.

The first chief influence of modern science on the schools' curricula came from a separate government department founded in 1836 as a school of design. In 1853 this was reconstituted as the department of science and art, largely by the influence of Prince Albert, and partly as a consequence of the first international exhibition held in London in 1851. This department began to hold examinations and make grants for teaching of science and art, and ultimately extended its subsidies to schools recognized by it as "Organized Science Schools," in which regular courses of instruction in science were given. In 1900 the new board of education absorbed the department of science and art, and also the education department dealing with elementary schools. It thus became the sole central authority, and in 1901 began to give grants to approved secondary day schools with regular courses. It has also in connection with these grants developed a very full and valuable system of inspection conducted by its own staff. In 1902, as already mentioned, the county and country boroughs became education authorities, the minor localities possessing only concurrent jurisdiction with the counties in higher education. Since 1902 these authorities almost without exception have made considerable annual grants to the secondary schools in their areas, and a marked improvement is already visible in the efficiency of the schools, and the length of attendance of the pupils. These grants of course are given almost entirely to the smaller schools. The endowments and fees of the first grade "Public Schools" render them independent of such assistance and consequently of the board of education. In 1914 there were 910 grant-aided schools, all free to children from the public elementary schools.

**Mixed Schools.**—There has been a certain amount of experiment in this direction, and prejudice has to a large extent been dispelled, but on the whole the best English opinion seems inclined to the view that, other things being equal, it is preferable to educate girls

and boys in separate schools. There are, however, many places unable to support two separate schools, and in these co-education is being tried with some success. But there is no likelihood of its ever being tried in the older public schools, where the school age does not end before 18 or 19, and this precedent will probably always militate against it in smaller schools.

**Curriculum of Secondary Schools.**—So far as boys' schools are concerned, not very much liberty is really left to initiate startling reforms. Pupils are prepared for the universities, for civil service, or for army and professional examinations, and it is these which really prescribe the subjects. In addition to the actual university courses most of the universities have followed the example of Oxford and Cambridge in establishing "Local Examinations" and the "Examinations of the Joint Board" for the benefit of pupils still at school. These tests, especially when joined with inspection, have done most valuable service.

**Other Secondary and Technical Education.**—The science and art department, already mentioned, held various examinations and gave grants to classes and prizes to pupils. But it was the Technical Instruction Act of 1889, and still more the Local Taxation (Customs and Excise) Act of 1890 which encouraged local authorities to spend money on so-called "technical" subjects. The list of these subjects finally included, I believe, everything secondary except the classics. Even Shakespeare is said to have been taught under the head of "Commercial English." These powers brought the councils of counties and boroughs and urban districts into the field as education authorities, and in addition to their grants to secondary schools and their scholarship schemes, they did much to prepare for their future work in secondary education proper. The chief effect of the limitation to "technical" instruction was to encourage the teaching of science subjects, which had never before received proper recognition. This limitation to "technical" instruction was entirely swept away in 1902, when the local authorities received power to administer all higher education as well as elementary. In the last 25 years a large number of "Institutes," "Schools of Art," and "Technical Schools" have been built or enlarged. Marked progress has been made in the education of those persons who during the day are engaged in trades and professions. The quality and scope of the teaching have been considerably improved, and the chief need at present is to secure the attendance of lads and girls who are leaving the elementary schools and to induce them to complete well-arranged courses of not less than three or four years' duration. In 1916 there were 6,097 of these schools.

**English Universities.**—These may perhaps most conveniently be divided into two classes, the old and the new. In no branch of education has there been a more rapid or startling development than here. In 1826 there were only Oxford and Cambridge, the traces of whose origin are lost in the early Middle Ages. In 1916 no less than seven new universities enjoy a prosperous existence, while there are other university colleges which may hereafter develop into universities themselves.

*The New.*—Manchester, Liverpool and

Leeds, federated in 1880 as Victoria University, have recently acquired separate charters. Birmingham, established in 1880 as Mason College, became a university in 1900. Durham, founded in 1832, has been constituted more on the lines of Oxford and Cambridge, except for its association with the college at Newcastle. London, which received its first charter in 1836, was afterward for many years merely an examining body, but at last in 1898 received a new constitution enabling it to embrace all the chief institutions for higher teaching situated in and near the capital, and to distinguish between its internal (or taught) and external (or merely examined) students. Sheffield University received its charter in 1905. It is difficult to do justice to the splendid energy and the magnificent generosity which has founded and worked most of these institutions — qualities which can be more easily paralleled among the universities of America. These institutions are new, they are efficient, they do well a work which needed doing. But as the object of educational study, they are less interesting than the universities of Oxford and Cambridge.

*The Old.*—It would be hard to explain to a stranger the way in which Oxford and Cambridge have in the past entered into the life of the whole country, attracting to themselves not only the sons of men of rank, position and leisure, but also poor and able lads likely hereafter to make their way both at home and in the world at large. It is probable that no Cabinet will ever again be composed almost exclusively of men drawn from these two universities, but it is equally improbable that any Cabinet will ever lack them altogether. Oxford and Cambridge supply a very large part of that executive civil service to which England owes so much, and of which so little is heard. In nearly every country parish the squire and the parson can still exchange reminiscences of a university common to them both, for in the past the size of the country and of the population rendered it possible for two universities to gather together, widely speaking, the representatives of the governing and teaching classes. If these young men did not always get much learning, at least they grew from boyhood to manhood in an atmosphere of discipline and among their equals. The influence moreover of the beautiful buildings set in an environment of groves and lawns and quiet streams, and the association of national history and literature, were a factor in their education which nothing else could supply. Oxford "as she lies in the moonlight, spreading from her towers the enchantments of the Middle Ages," and Cambridge, her equal and rival, have an influence still reaching deep and wide into the character of the nation.

It must not, however, be supposed that cautious reforms have not adapted these universities to the changing needs of the time. By the beginning of the 19th century examinations were instituted, the best of which have probably done the work possible to examinations as well as it has ever been done. Royal commissions in the middle of the century, and again in 1877 led to the revision of the mediæval statutes and to the abolition of many obsolete restrictions and privileges. All religious tests were finally abolished in 1873. The time has perhaps come round for a new inquiry, but the particular methods of teaching by lectures and by tutorial work are

carried out with a thoroughness and care which it would be difficult to surpass. In the past 50 years nine distinct new courses have been added to the curricula both for Oxford and Cambridge graduation, besides new subjects for which diplomas are granted. Museums and libraries, laboratories, institutes and workshops have been freely erected, and only a lack of money prevents further developments. For it is a curious feature of their constitution that in both places eight-ninths of the property belongs to the individual colleges in which the men reside and one-ninth only to the universities themselves.

*The Rhodes Bequest.*—The most striking departure of recent years has, however, been due to a son of Oriel College, Cecil Rhodes, who bequeathed an income of some \$170,000 a year to be given in 60 scholarships to the Colonies, 102 to the United States, and 15 to Germany, all tenable only at Oxford. The result of this policy it is premature to forecast, but the experiment so far has met with success. Oxford has welcomed the scholars, and they have at once found their feet and seem cordially to recognize the distinctive character of the benefits which the university has to offer without being blind to its limitations.

*University Extension.*—Besides the direct work of the universities, old and new, notice should be taken of their pioneer efforts in developing education by means of lectures. This has proved specially valuable in the development of some half dozen university colleges, of which Reading is the most conspicuous example.

*Higher Education of Women.*—The education of women has met with many difficulties in England, but except for the refusal of degrees at Oxford and Cambridge, practically all desired privileges are now everywhere open to them. In the newer colleges and universities they are received on the same terms as men, except in certain medical courses. In Cambridge they have two colleges, in Oxford four and they are admitted to all such teaching as they require and to all examinations. Degrees alone are withheld and actual membership of the universities which would involve a share in their government. The universities of Birmingham, Durham, Liverpool, Manchester, Leeds and Sheffield grant degrees to women; there are five colleges for women in and near London, and three in Wales.

#### WALES.

*Introductory.*—Of the four quarters of the United Kingdom, Wales has made the most rapid progress. In the middle of the 19th century her elementary education had probably the worst equipment; her secondary schools were inadequate and inefficient; while in higher education she possessed only the recent foundation of Lampeter, which was then little more than a theological college.

*Elementary.*—The Welsh elementary schools have always been under the administration of the English Board, and, considering the inaccessibility of the wilder parts of the country, have made at least a proportionate progress. Nowhere has more difficulty arisen in the administration of the Education Act of 1902, and a section in the Bill of 1906 provided for the establishment of a separate Education Department for Wales. Teachers and schools probably suffered to some extent, but the future progress

of Welsh education is in any case assured. Wales has the educational advantage of being a bilingual country to a greater extent even than Ireland, and this has long been fully recognized in her schools.

**Secondary.**—Wales, while sharing in the educational inquiries and reforms of England, made in 1889 an enormous step in advance. In that year she obtained the Welsh Intermediate Education Act, under which small joint education committees were established in all the counties and county boroughs, and by this means an admirable system of county secondary schools for boys and girls was established. In 1897 a Central Welsh Board was created to provide for examination and inspection of the different schools which had been created and organized out of the rates and grants placed at the disposal of the joint education committees.

**Universities.**—In university teaching Wales in a single generation has rivaled the provision of Scotland. A training college was founded in 1862, and the first university college at Aberystwyth in 1872. In 1883–84 university colleges were established at Cardiff and Bangor, and the annual grant they received from government was before long extended to Aberystwyth. In 1893 they were incorporated in the University of Wales, which has since been extended so as to include Lampeter, which, however, has the power of giving separate degrees. Women have been admitted from the beginning to the Welsh university colleges and the university.

#### SCOTLAND.

**Preliminary.**—The history of education in Scotland accounts for the virtues and most of the defects in the Scottish system. In the old days the elementary school led direct to the universities, and the universities were hampered by doing the work of secondary schools. On the other hand there were few boys of ability and character who could not get the best education in the country, and the sacrifices they made had a large share in the success so many of them ultimately achieved. To-day the path is easier, the opportunities greater, and the instruction has progressed with the times.

**Elementary.**—John Knox laid down a scheme for the establishment of a grammar school in every town, but most of the funds intended for the endowment passed into other hands. In 1696, however, a system of schools was established by statute, the landowners being bound to provide a schoolhouse, and a salary for the teacher, in every parish. The salary was small, and the exceptions numerous, but a rate-aided system was actually organized, and owing to the cheapness of the university system, and the frugality of the country, much excellent work was done. The conditions of the teacher and the method of his appointment were gradually improved by statute, though no State aid was forthcoming till 1833. The first Parliamentary grants for elementary education applied equally to Scotland, which was under the English Board of Education until 1872. In that year the first education act for Scotland was passed. In spite of the multiplicity of her religious denominations, Scotland was ready to accept a universal system of school boards, who were left entirely free to teach what religious formulæ they pleased in their schools. Compul-

sory attendance between five and thirteen was enforced throughout the country under a maximum penalty amounting to as much as five dollars, a sum not reached in England until 1900. A special committee for education for Scotland was now created, which in 1885 was given a separate secretary.

In a general sketch it is impossible to point out the numerous small differences between the Scottish and English systems. Scotland was earliest to escape from the revised code and payments by results, uniform curricula and mechanical inspection; first to provide special treatment for blind and deaf children; first to secure free education, and to improve her physical training. A Scot may be pardoned if he sums up the main results by saying that the outlook is generally more from the education standpoint, the teacher more fervid and better educated, and the children more eager for knowledge. The religious difficulty has been entirely avoided, and that in the chief home of religious controversy. A mention should be made of the celebrated Dick bequest which in the northern counties has done much to improve the quality of the teaching by subsidies to better qualified teachers. This also has materially assisted children from elementary schools ultimately to fit themselves for a university education. A bill to introduce certain reforms into the organization of the system and increase the powers of the school boards, has twice been introduced into Parliament, but has not yet been passed, though Scotch members now appear fairly agreed on its merits.

**Secondary and Higher Education.**—In spite of Knox's comparative failure there were burgh schools and academies established in nearly all the burghs by 1866, and the existing endowments, though capable of better use, had never been greatly abused or misappropriated. A leaving certificate has been organized with much success by the Education Department, which holds the necessary examinations, as well as inspecting higher class schools. In 1914 there were 19,780 pupils on the rolls.

The science and art teaching formerly conducted under the auspices of South Kensington was in 1897 transferred to the charge of the Scotch Education Department. Technical instruction in the United Kingdom may be said to have had its rise at Glasgow in Anderson's Institute, but the cheapness of the universities and greater facilities for general education has always prevented much specialization on purely technical subjects.

**Universities.**—In no respect has Scotland fared better than in the number and accessibility of her universities. Saint Andrews (1417) with three colleges, Glasgow (1450), Aberdeen (1494) with two colleges, and Edinburgh (1582) afforded every opportunity that the poorest student could wish. It was necessary to attend lectures, but there was no residence in college, and the long summer vacations were used by poor students to earn their fees for the winter. The chief reforms which have been carried have been to raise the minimum requirements for graduation, to make fees uniform, to admit women, to provide adequate buildings, and to endow new subjects of instruction. The greatest liberality has been shown in providing funds for the last two of these purposes, and

the universities are now well housed and well staffed. Mr. Andrew Carnegie in 1901 gave \$10,000,000, the income of which is to be spent equally between the endowment of certain branches of study and research, and paying the fees of poor students. The latter half of the bequest seems unlikely to benefit the character of a class which would formerly have found such assistance unnecessary, but the value of the portion applied to the endowment it would be difficult to exaggerate.

#### IRELAND.

**Introductory.**—In Ireland the state of education has been most deplorable, and is still far behind the rest of the kingdom. This is due to poverty, to politics, and to religious bigotry. The difficulties caused by bigotry and politics when a Protestant minority was in power in the earlier half of the 19th century caused those who were responsible for elementary education to steer a cautious and ineffectual course; a different set of difficulties due to the same causes, working through the priesthood and the politicians, prevent any thorough reform to-day. And always the grinding poverty of the nation as a whole has hindered the schools and the teachers from being brought up at any given time to the standard which prevailed in English or in Scottish education.

**Elementary Education.**—Till the end of the 18th century Catholic schools were illegal, and existed chiefly as "Hedge Schools." Considerable funds were spent, chiefly in encouraging proselyting institutions. In 1831, however, the present system administered by the Board of Commissioners of National Education in Ireland was introduced, and has continued without any sweeping changes to this day. Elementary education is controlled by 20 Commissioners. Their report (Jan. 1915) showed 8,207 schools with an average of 700,265 pupils, and an average daily attendance of 72.6 per cent. Roman Catholic schools number 4,441, with 389,437 pupils, and 1,553 Protestant schools with 116,969 pupils.

The most hopeful feature in Irish education in recent years has been the establishment of the Department of Agriculture and Technical Instruction, created in 1899, which, beside administering technical instruction, has acted as the adviser of the National Commissioners with regard to teaching agriculture and elementary science in the elementary schools, and in enabling the teachers to obtain instruction in these and kindred subjects. The report of the Belmore Commission, in 1898, showed the most deplorable backwardness in all modern developments of primary instruction. Progress is being made, though it will naturally take years to overcome the neglect and ignorance of ages.

**Secondary Education.**—The chief agent in secondary education in Ireland, apart from the board which administers the endowments, and before the establishment of the Technical Instruction Board, has been the Commissioners of Intermediate Education. In 1878 this board was founded and endowed with five million dollars from the funds of the disestablished Church of Ireland. In 1890, \$250,000 a year were added to this income. The money, however, has been awarded on the results of examinations, and before the system was reorganized

in 1902 the whole scheme was one of payment-by-results run mad. In 1913 an act was passed providing for grants, and in 1914 an annual sum of \$200,000 was granted by Parliament toward the salaries of teachers. The Technical Instruction Board is doing most admirable work and is being well seconded by the county councils.

**University Education.**—The Elizabethan foundation of the University of Dublin and Trinity College, which practically form one body, has throughout its career had a marked success as a Protestant university on the lines of Oxford and Cambridge. Tests were abolished to a great extent in 1793, and finally in 1873, but the Catholics have never as a body accepted Trinity as a national institution. The three Queen's colleges, founded in 1845, have had even less success in this respect, and the Queen's University, in which they were amalgamated, was replaced in 1879 by the Royal University of Ireland. As Secretary of State for Ireland, Mr. (now Viscount) Bryce formulated in 1907 a scheme whereby Trinity College, Queen's College and a new college for Roman Catholics were to be merged in a new "University of Dublin," but the plan was opposed by the Dublin University Defense Committee and the Irish bishops on religious grounds. The British government then proposed to establish one university in Dublin and another in Belfast, the former for Catholics and the latter for Protestants, although no religious tests were to be enforced in either. Finally, the National University of Ireland was founded in Dublin and the Queen's University of Belfast in 1909. The former makes a specialty of the Irish language—a compulsory subject of matriculation, while the latter grants degrees, exhibitions and scholarships alike to female and male students. The report for 1914-15 gives approximately 347 teachers and 2,620 students in the Irish universities. The number of male students is necessarily influenced by the war.

**Higher Education of Women.**—Women have been admitted to the examinations and degrees of the Royal University from its foundation, and have since been allowed to attend the lectures of the Queen's colleges. For a long time Trinity College and the University of Dublin would not admit them either to lectures, examinations, or degrees. The examinations were conceded first, the lectures followed; and now women who have been at Oxford and Cambridge, and require a degree for teaching or other purposes, obtain it freely at Dublin and Belfast, which thus drive a flourishing business at the expense of their less progressive rivals.

## 42. ENGINEERING IN GREAT BRITAIN.

Engineering as a profession is only partially organized in Great Britain. To understand the present state of development a brief historical statement is necessary.

**Historical.**—On the military side engineering is and has been thoroughly organized. Fortification and the art of constructing defenses are probably as old as society. The Babylonians, Greeks and Romans showed skill and originality in design and construction which has nowhere been surpassed. From the introduction of the catapult, ballista, and other engines of war amongst the Greeks and Romans mechanical skill likewise received wide and steady development.
